The threat identification process is a means to collect data on potential threats that can assist management in its identification of information security risks. Threat modeling is a structured approach that enables an institution to aggregate and quantify potential threats. Institutions should consider using threat modeling to better understand the nature, frequency, and sophistication of threats; evaluate the information security risks to the institution; and apply this knowledge to the institution's information security program. As threats evolve rapidly, however, it is understood that modeling may not account for attacks that have not previously been seen, such as zero-day attacks, but could have significant impacts.

II.A.2 Vulnerabilities

A vulnerability is a weakness in an information system, system security procedure, internal control, or implementation that could be exploited by a threat source.[13] A technical vulnerability can be a flaw in hardware, firmware, or software that leaves an information system open to potential exploitation. These flaws provide opportunities for hackers to gain access to a computer system, execute commands as another user, or access data contrary to specified access restrictions. Institutions can use automated vulnerability scanners to scan their computer systems for known security exposures, as well as services available from third parties, such as the Mitre Corporation's Common Vulnerability and Exposures (CVE),[14] to track vulnerabilities.

In addition to technology-based vulnerabilities, weaknesses in business operational processes can create security vulnerabilities, exposing financial institutions to unwarranted risk. These vulnerabilities can include weaknesses in security procedures, administrative controls, physical layout, or internal controls that could be exploited to gain unauthorized access to information or to disrupt critical services. For example, an institution's systems architecture may be designed based on management's assumption that manual validation of wire transfers takes place before execution, when in practice the business process does not perform that validation until after transfers have taken place.

[12] NIST SP (Special Publication) 800-30, revision 1, "Information Security: Guide for Conducting Risk Assessments," September 2012.

[13] Ibid.

[14] CVE is a dictionary of publicly known information security vulnerabilities and exposures. The Mitre Corporation maintains the system. CVE is sponsored by the U.S. Computer Emergency Readiness Team in the Office of Cybersecurity and Communications at the U.S. Department of Homeland Security.

In addition to the vulnerabilities within a financial institution's system, vulnerabilities may also arise from interdependent and interconnected systems. Financial institutions connect their systems through mergers and acquisitions and through relationships with third parties. Over time, as these systems become increasingly interdependent and complex, new vulnerabilities may be introduced. Moreover, financial institutions are dependent on a vast array of hardware and services that may result in vulnerabilities from their supply chains, including those found in hardware and software products.

Management should assess whether the institution has processes and procedures in place to identify and maintain a catalogue of relevant vulnerabilities, determine which pose a significant risk to the institution, and effectively mitigate and monitor the risks posed by those vulnerabilities. When management cannot or chooses not to mitigate a vulnerability, management should document the decision to accept the risk, the level of risk associated with the vulnerability, and the person accountable for accepting the risk. Refer to the "Security Operations" section of this booklet for more information.

II.A.3 Supervision of Cybersecurity Risk and Resources for Cybersecurity Preparedness

II.A.3(a) *Supervision of Cybersecurity Risk*

Cybersecurity is the process of protecting consumer and bank information by preventing, detecting, and responding to attacks. As part of cybersecurity, institutions should consider management of internal and external threats and vulnerabilities to protect information assets and the supporting infrastructure from technology-based attacks. In light of the increasing volume and sophistication of cybersecurity threats, examiners should focus on cybersecurity preparedness in assessing the effectiveness of an institution's overall information security program.

II.A.3(b) *Resources for Cybersecurity Preparedness*

The FFIEC members issued a voluntary Cybersecurity Assessment Tool[15] to help institution boards and management identify risks to their institutions and evaluate their institution's cybersecurity preparedness. In addition, there are other resources available to help management develop and evaluate information security and cyber resilience, such as the NIST Cybersecurity Framework, common approaches developed by the Mitre Corporation, and the U.S. Computer Emergency Readiness Team's (US-CERT)[16] National Cyber Awareness System. Institution management can select a single framework or use a combination of resources to help identify its risks and determine its cybersecurity preparedness. Regardless of the source, frameworks can help management identify a cybersecurity and resilience posture that is commensurate with the institution's risk and complexity.

[15] Refer to the Cybersecurity Assessment Tool on the FFIEC website.

[16] US-CERT, of the Department of Homeland Security, responds to major incidents, analyzes threats, and exchanges critical cybersecurity information with trusted partners around the world.

II.B Risk Measurement

Action Summary

Management should develop risk measurement processes that evaluate the inherent risk to the institution.

The risk measurement process should be used to understand the institution's inherent risk and determine the risk associated with different threats. Management should use its measurement of the risks to guide its recommendations for and use of mitigating controls.

Threat analysis tools assist in understanding and supporting the measurement of information security-related risks. Such tools can include event trees,[17] attack trees,[18] kill chains,[19] and other security-related schemata.[20] These tools help management deconstruct an event into stages, better understand the event, identify the most effective and efficient means of mitigating risk, and improve the information security program. Additionally, management could use a taxonomy for security-related events to help accomplish the following:

- Map threats and vulnerabilities.
- Incorporate legal and regulatory requirements.
- Improve consistency in risk measurement.
- Highlight potential areas for mitigation.
- Select proper controls to cover various attack stages, channels, and assets.
- Allow comparisons among different threats, events, and potential mitigating controls.

Refer to the *IT Handbook's* "Management" booklet for more information.

[17] An event tree is a diagram of a chronological series of events in a system or activity that displays sequence progression, end states, and dependencies across time.

[18] An attack tree is a diagram showing how an asset, or target, might be attacked through various attack scenarios. Using an attack tree helps describe threats on computer systems and possible attacks to realize those threats.

[19] A kill chain originally was used as a military concept related to the structure of an attack. In information security, a kill chain is a method for modeling intrusions on a computer network.

[20] Security-related schemata are lists of software vulnerabilities and include the Mitre Corporation's Common Attack Pattern Enumeration and Classification, CVE, Common Weakness Enumeration, "ATT&CK Matrix," and Malware Attribute Enumeration and Characterization, and Mandiant's Open Indicators of Compromise.

II.C Risk Mitigation

Action Summary

Management should develop and implement appropriate controls to mitigate identified risks.

Once management has identified and measured the risks, it should develop and implement an appropriate plan to mitigate those risks. This plan should include an understanding of the extent and quality of the current control environment. When conducting an evaluation of the strength of controls, or the ability to mitigate risk, the institution should consider the system of controls rather than any discrete control.

Management should also obtain, analyze, and respond to information from various sources (e.g., Financial Services Information Sharing and Analysis Center [FS-ISAC]) on cyber threats and vulnerabilities that may affect the institution. Management should incorporate available information on cyber events into the institution's information security program. Additionally, management should develop, maintain, and update a repository of cybersecurity threat and vulnerability information that may be used in conducting risk assessments and provide updates to senior management and the board on cyber risk trends.

II.C.1 Policies, Standards, and Procedures

Information security policies, standards, and procedures should define the institution's control environment through a governance structure and provide descriptions of required, expected, and prohibited activities. Policies, standards, and procedures guide decisions and activities of users, developers, administrators, and managers and inform those individuals of their information security responsibilities. Policies, standards, and procedures should also specify the mechanisms through which responsibilities can be met. In addition, they should provide guidance on acquiring, designing, implementing, configuring, operating, maintaining, and auditing information systems. Policies, standards, and procedures that address the information security program should describe the roles of the information security department, lines of business, and IT organization in administering the information security program. Information security policies, standards, and procedures form the means by which the objectives of the information security program are achieved. Key attributes that contribute to the success of information security policies, standards, and procedures include the following:

- Scope that describes the expectations for appropriate actions by affected parties.
- Sufficient details to guide behavior.
- Implementation through ordinary means, such as system administration procedures and acceptable use policies.
- Enforcement through security tools and restrictions.
- Delineation of the areas of responsibility for users, developers, administrators, and managers.
- Clear and easily understandable communications to all affected parties.
- Certification that employees have read and understand the policies.

- Flexibility to address changes in the environment.
- Annual board review and approval.

II.C.2 Technology Design

While technology can introduce risk, it can also serve as a mitigation tool. Management should understand the benefits and limitations of the technology that the institution uses and whether other types of controls are necessary to compensate for those limitations.

Information security issues arise when (a) the design of the technology and the policies governing its use do not effectively defend against identified and unidentified threats, (b) threats change in ways not envisioned by the designers, and (c) the controls are not operating as intended. Management should continually assess the capability of the institution's processes, people, and technologies to sustain the appropriate level of information security based on the institution's risk profile, size, complexity, and risk appetite.

II.C.3 Control Types

Management may mitigate information security risks by implementing controls. Controls may be categorized according to timing and nature.

Table 1: Examples of Timing- and Nature-Related Controls

Timing		
Control type	**Description**	**Example**
Preventive	Controls designed to prevent incidents from occurring	Access controls to applications and systems that prevent unauthorized individuals from performing transactions
Detective	Controls designed to alert management when incidents occur	Reports that show suspicious activity
Corrective	Controls that lessen impact to the institution when adverse incidents occur	Business continuity plans
Nature		
Control type	**Description**	**Example**
Administrative	Controls that align with the board-approved risk appetite and inform employees of management's expectations	Policies or procedures that guide implementation of the information security program
Technical	Software or hardware (or both) that prevents unauthorized activity	A firewall that prevents unauthorized logical access to or from a network
Physical	Devices to prevent unauthorized physical access to a facility or computer system	A deadbolt lock on a door

It is important to have a layered control system, which deploys different controls at different points of a business process and throughout an IT system so that the strength of one control can compensate for weaknesses in or possible failure of another control. Therefore, layered controls function in an integrated fashion to more effectively mitigate risk.

Economic and technical considerations generally affect prevention and detection or response choices in system design. Compensating controls are controls that adjust for weaknesses within the system or process. An example of compensating controls would be a review of activity logs for applications that do not allow proper segregation of duties.

II.C.4 Control Implementation

Management should implement controls that align security with the nature of the institution's operations and strategic direction. Based on the institution's risk assessment, the controls should include, but may not be limited to, patch management, asset and configuration management, vulnerability scanning and penetration testing, end-point security, resilience controls, logging and monitoring, and secure software development (including third-party software development). In implementing controls, management should ensure it has the necessary resources, personnel training, and testing to maximize the effectiveness of the controls.

The level at which controls are implemented should depend on the institution's size, complexity, and risk profile, but all institutions should implement appropriate controls. In light of increasing cybersecurity risks, management should implement risk-based controls for managing cybersecurity threats and vulnerabilities, such as interconnectivity risk. Management should review and update the security controls as necessary depending on changes to the internal and external operating environment, technologies, business processes, and other factors.

The institution can reference one or more recognized technology frameworks and industry standards. Several organizations have published control listings in addition to implementation guidance, including the following:

- **NIST 800 series of publications.** These publications provide descriptions of some management processes and technical guidance on many individual controls.
- **Control Objectives for Information and Related Technology (COBIT).** COBIT provides a broad and deep framework for governance and management of enterprise IT.
- **IT Infrastructure Library (ITIL).** ITIL provides a list of recognized practices for IT service management.
- **International Organization for Standardization (ISO)[21] 27000 series.** The ISO 27000 series provides control standards specific to information security.
- **Industry publications and sources.[22]** Management and staff may find these useful for discrete controls and processes.

[21] ISO is an independent, non-governmental, international organization that brings together experts to share knowledge and develop voluntary, consensus-based, market-relevant international standards.

[22] Some industry publications or organizations that provide security-related information include the ISACA Journal, SANS Institute, the Financial Services Roundtable, the Council on Cybersecurity, and the Open Web Application Security Project.

- **Vendor-provided publications, bulletin boards, and user groups.** Vendors often publish recommendations for securing their products. Additionally, some offer bulletin boards and user groups for clients to interact among themselves.

II.C.5 Inventory and Classification of Assets

Action Summary

Management should inventory and classify assets, including hardware, software, information, and connections.

Management should maintain and keep updated an inventory of technology assets that classifies the sensitivity and criticality of those assets, including hardware, software, information, and connections. Management should have policies to govern the inventory and classification of assets both at inception and throughout their life cycle, and wherever the assets are stored, transmitted, or processed. Inventories enable management and staff to identify assets and their functions. Classification enables the institution to determine the sensitivity and criticality of assets. Management should use this classification to implement controls required to safeguard the institution's physical and information assets. Additionally, management can use the inventory to discover specific vulnerabilities, such as unauthorized software.

Inventories are important for management to identify assets that require additional protection, such as those that store, transmit, or process sensitive customer information, trade secrets, or other information or assets that could be a target of cyber criminals. Knowing what information assets the institution has and where they are stored, transmitted, or processed helps management comply with federal and state laws and regulations regarding privacy and security of sensitive customer information.

After inventorying the assets, management should classify the information according to the appropriate level of protection needed. For example, systems containing sensitive customer information may require access controls based on job responsibilities. These systems should have stronger controls than systems containing information meant for the general public. Some institutions classify information as public, non-public, or institution-confidential, while others use the classifications high, moderate, and low. Additional classifications, such as critical and noncritical, may be helpful to certain types of institutions.

II.C.6 Mitigating Interconnectivity Risk

Business processes often require institutions to share information with other institutions and third-party service providers that require connectivity. The extent of interconnectivity is a function of network architecture, network complexity, traffic volume, and number of connections. Interconnectivity risk arises from misuse, mismanagement, or compromise of these connections.

To mitigate interconnectivity risk, management should do the following:

- Identify connections with third parties, including other financial institutions, financial institution intermediaries, and third-party service providers.
- Identify all access points and connection types that pose risk, such as local area network (LAN) connections to other networks or Internet service providers (ISP), Wi-Fi, and cellular connections.
- Identify connections between and access across low-risk and high-risk systems.
- Assess all connections with third parties that provide remote access capability or control over internal systems.
- Implement and assess the adequacy of controls to ensure the security of connections regardless of criticality or sensitivity.

Management should maintain network and connectivity diagrams and data flow charts to ensure adequacy of layered controls and to facilitate more timely recovery and restoration of systems when incidents occur.

II.C.7 User Security Controls

Action Summary

Management should mitigate the risks posed by users by doing the following:

- Establishing and administering security screening in IT hiring practices.
- Establishing and administering a user access program for physical and logical access.
- Employing segregation of duties.
- Obtaining agreements covering confidentiality, nondisclosure, and authorized use.
- Providing training to support awareness and policy compliance.

Users should be granted access to systems, applications, and databases based on their job responsibilities. Access rights should be granted in accordance with the institution's physical and logical access control policies. Authorized users with elevated or administrator privileges can pose a potential threat to systems and data. Employees, contractors, or third-party service providers can exploit their legitimate computer access for unauthorized purposes. Additionally, the degree of internal access granted to some users increases the risk of damage or loss of information and systems. Risk exposures from internal users include the following:

- Alteration of data.
- Deletion of production and backup data.
- Misdirected data.
- Disruption of systems.
- Destruction of systems.
- Misuse of systems for personal gain or to damage the institution.
- Appropriation of strategic or customer data for espionage or fraud schemes.
- Extortion for stolen data.
- Misuse of data following the termination or change in job responsibility of an employee.

Management should understand the risks to the institution’s information-processing environment and establish appropriate user access controls to mitigate these and other potential risks to the institution’s assets. Users should understand and confirm their understanding of their roles and responsibilities in maintaining a sound security environment, which includes both physical and logical areas.

II.C.7(a) *Security Screening in Hiring Practices*

Management should have a process to verify job application information for all new employees. The sensitivity of a particular job or access level may warrant additional screening and recurring background and credit checks. Management should verify that contractors are subject to similar screening procedures. In addition to initial screening, management should remain alert to changes in personal circumstances of employees and contractors that could increase incentives for system misuse or fraud.

II.C.7(b) *User Access Program*

Management should develop a user access program to implement and administer physical and logical access controls to safeguard the institution’s information assets and technology. This program should include the following elements:

- Principle of least privilege, which recommends minimum user profile privileges for both physical and logical access based on job necessity.
- Alignment of employee job descriptions to the user access program.
- Requirements for business and application owners to define user profiles.
- Ongoing reviews by business line and application owners to verify appropriate access based on job roles with changes reported on a timely basis to security administration personnel.
- Timely notification from human resources to security administrators to adjust user access based on job changes, including terminations.
- Periodic independent reviews that ensure effective administration of user access, both physical and logical.

For more information, refer to the “Physical Security” and “Logical Security” sections of this booklet.

II.C.7(c) *Segregation of Duties*

Segregation of duties, or job designs that require more than one person to complete critical or sensitive tasks, can help mitigate risk. Employees and third parties with access to sensitive resources could cause substantial damage and potential loss. System administrators, for instance, have the most powerful role in the user access process and have unlimited access to an institution’s information assets and technology. Given this extensive access, management should evaluate the process for determining which individuals should be granted system administrator privileges. Such access should be appropriately monitored for unauthorized or inappropriate activity. Management should incorporate independent reviews or approvals for individuals who perform multiple functions to minimize the potential for fraud, irregularities, and errors. Examples of segregation of duties include the following:

- Independent monitoring of the activities performed by the users with increased privileges (e.g., system administrators and super users[23]).
- Distribution of system administration activities so no administrator can hide his or her activities or control an entire system.
- Additional levels of approval as the criticality and sensitivity of decisions increase.

If an activity is conducted without appropriate segregation of duties, management should require an independent review (e.g., audit) of that activity.

II.C.7(d) *Confidentiality Agreements*

The institution should protect the confidentiality of customer and institution information. A breach in confidentiality could disclose proprietary information, increase fraud risk, damage the institution's reputation, violate customer privacy and associated rights, and violate laws or regulations. Confidentiality agreements can be used to put all parties on notice that the financial institution owns its information, expects strict confidentiality, and prohibits information sharing outside of that required for legitimate business needs. Management should obtain signed confidentiality agreements before granting employees and contractors access to IT systems.

II.C.7(e) *Training*

Training ensures personnel have the necessary knowledge and skills to perform their job functions.[24] Training should support security awareness and strengthen compliance with security and acceptable use policies. Ultimately, management's behavior and priorities heavily influence employee awareness and policy compliance, so training and the commitment to security should start with management. Management should educate users about their security roles and responsibilities and communicate them through acceptable use policies. Management should hold all employees, officers, and contractors accountable for complying with security and acceptable use policies and should ensure that the institution's information and other assets are protected. Management should have the ability to impose sanctions for noncompliance.

Training materials for most users focus on issues such as end-point security, log-in requirements, and password administration guidelines. Training programs should include scenarios capturing areas of significant and growing concern, such as phishing and social engineering attempts, loss of data through e-mail or removable media, or unintentional posting of confidential or proprietary information on social media. As the risk environment changes, so should the training. The institution should collect signed acknowledgments of the employee acceptable use policy as part of the annual training program.

[23] In computing, the super user is a special user account used for system administration. Depending on the operating system, the name of this account might be root, administrator, admin, or supervisor.

[24] See also Information Security Standards, section III.C.2, requiring each financial institution to train staff to implement its information security program.

II.C.8 Physical Security

Action Summary

Management should implement appropriate preventive, detective, and corrective controls for physical security.

Physical access and damage or destruction to physical components can impair the confidentiality, integrity, and availability of information. Management should implement appropriate preventive, detective, and corrective controls for mitigating the risks inherent to those physical security zones.

A data center houses an institution's most important information system components. When selecting a site for a data center, one major objective should be to limit the risk of exposure from internal and external threats, including, where possible, environmental threats inherent to physical locations (e.g., hurricanes, earthquakes, and blizzards). The selection process should include reviewing the surrounding area to determine whether it is relatively safe from exposure to fire, flood, explosion, or similar environmental hazards. Guards, fences, barriers, surveillance equipment, or other devices can deter intruders. Because access to key information systems' hardware and software should be limited, appropriate physical controls should be in place. Additionally, the location should not be identified or advertised by signage or other indicators.

Detection devices, when applicable, should be used to prevent theft and safeguard the equipment. The devices should provide continuous coverage. Detection devices have two purposes—to send alarms when responses are necessary and to support subsequent forensics. Alarms are useful only when response will occur. Some detection devices include the following:

- Switches that activate alarms when electrical circuits are broken.
- Light and laser beams, ultraviolet beams, sound, or vibration detectors that are invisible to intruders, and ultrasonic or radar devices that detect movement.
- Closed-circuit television (CCTV) that provides visual observation and records intrusions.

A combination of fire suppression, smoke alarms, raised flooring, and heat and moisture sensors should address risks from environmental threats (e.g., fire, flood, and excessive heat). Environmental threat monitoring should be continuous, and responses should occur when alarms activate.

Physical security devices frequently need preventive maintenance to function properly. The institution should be able to provide maintenance logs to demonstrate that physical security devices are regularly maintained. Periodic testing provides assurance that the devices are operating correctly.

The institution should have policies governing the duties and responsibilities of security guards. Employees who access secured areas should have proper identification and authorization to enter the areas. All non-employees should provide identification to a security guard before obtaining access. Security guards should be trained to restrict the removal of technology assets from the premises and to record the identity of anyone attempting to remove those assets. Management should implement a specific and formal authorization process for the removal of hardware and software from the premises.

Access should be restricted to the following equipment or areas:

- Operations centers (e.g., data center operations, security operations center, and network operations center) or server rooms; uninterruptible power supplies and backup generators.
- Funds transfer and automated clearinghouse routers.
- Telecommunications equipment.
- Media libraries.
- Equipment removed from the network and awaiting disposal.
- Spare or backup devices.

II.C.9 Network Controls

Action Summary

Management should secure access to computer networks through multiple layers of access controls by doing the following:

- Establishing zones (e.g., trusted and untrusted) according to the risk profile and criticality of assets contained within the zones and appropriate access requirements within and between each security zone.
- Maintaining accurate network diagrams and data flow charts.
- Implementing appropriate controls over wired and wireless networks.

Networks should be protected by a secure boundary, identifying “trusted” and “untrusted” zones. Internal zones, typically trusted, should segregate various components into distinct areas, each with the level of controls appropriate to the content and function of the assets within the zone. The institution’s trusted network should be protected through appropriate configuration and patch management, privileged access controls, segregation of duties, implementation of effective security policies, and use of perimeter devices and systems to prevent and detect unauthorized access. Tools used to enforce and detect perimeter protection include routers, firewalls, intrusion detection systems (IDS) and intrusion prevention systems, proxies, gateways, jump boxes,[25] demilitarized zones, virtual private networks (VPN), virtual LANs (VLAN), log monitoring and network traffic inspecting systems, data loss prevention (DLP) systems, and access control lists.

The trusted network should be further segregated into internal layers, including production, staging, and development environments. Within those environments, management should

[25] A jump box, or jump server, provides administrators with access to or control of other servers or devices in the network. Because of this capability, additional security measures should be implemented.

consider segregating sensitive traffic, by using Voice Over Internet Protocol[26] (VOIP) and network management (such as virtualization infrastructure that carries server boot images between storage devices and hosts). Each zone should have a security policy appropriate to its use, ensuring that zone restrictions are defined by risk, sensitivity of data, user roles, and appropriate access to application systems. Access to zones should be controlled according to the principle of least privilege and segregation of duties. To ensure appropriate network security, management should maintain accurate network and data flow diagrams, and store them securely, providing access only to essential personnel. These diagrams should identify hardware, software, and network components, internal and external connections, and types of information passed between systems to facilitate the development of a defense-in-depth security architecture.

II.C.9(a) *Wireless Network Considerations*

A wireless LAN (WLAN) is a medium of network connectivity, supported by radio wave transmissions that provides more convenient network access to employees or devices that need flexibility to connect to multiple locations within the institution’s facilities. Because the user is not physically connected to the network and the wireless signal is broadcast and available to others, wireless networks are inherently less secure than wired networks and require additional scrutiny, controls, and oversight. Wireless access points are the devices that broadcast the radio wave signals and should be physically secure to prevent compromise and securely configured to provide the same level of control as a wired connection. Wireless gateways can allow management to implement more complex access controls, including advanced identity management capabilities and services to detect and remediate malicious software.

Policies should prohibit installation of wireless access points and gateways without approval and formal inclusion in the hardware inventory. Network monitoring systems should be configured to detect the addition of new devices. Alternatively, network access control (NAC) systems could prevent the recognition of any unauthorized device.[27] Management should consider limiting the WLAN signal to authorized areas, within the boundaries of the institution, if feasible. Management should use an industry-accepted level of encryption with strength commensurate with the institution’s risk profile on the institution’s wireless networks.

Malicious insiders and attackers may also set up rogue or unauthorized wireless access points and trick employees into connecting. Such access points allow attackers to monitor employee activities. The institution should scan the network regularly to detect rogue access points and consider implementing NAC systems to prevent the successful connection of unauthorized devices.

[26] VOIP is the transmission of voice telephone conversations using the Internet or IP networks.

[27] A NAC system typically provides an IP address only after validating that the newly connected device is authorized, by means of some identification (such as a computer’s physical address—MAC address—or certificate) or pre-installed client software.

The institution may provide guests with access to a wired or wireless network. The guest network generally is used to provide access to the Internet and should be configured to prevent access to any portion of the production network.

Institutions often provide remote network connectivity for employees or third-party service providers[28] who are not located within or around the institution's facilities. This connectivity presents operational advantages, but steps should be taken to ensure that the connection is encrypted and secured. VPN connections should be used for both broadband networks and wireless air card connections to isolate and encrypt remote traffic to institution networks. IP geolocation information may not always be available when using broadband networks, which can limit the effectiveness of monitoring. Therefore, management should consider implementing compensating controls, such as restricting access to network resources.

II.C.10 Change Management Within the IT Environment

Action Summary

Management should have a process to introduce changes to the environment in a controlled manner. Changes to the IT environment include the following:

- Configuration management of IT systems and applications.
- Hardening of systems and applications.
- Use of standard builds.
- Patch management.

The IT environment consists of operating systems,[29] middleware,[30] applications, file systems, and communications protocols. The institution should have an effective process to introduce application and system changes, including hardware, software, and network devices, into the IT environment. The process for introducing software should encompass securely developing, implementing, and testing changes to both internally developed and acquired software.

Application and system control considerations for introducing changes to the IT environment before implementation should include the following:

- Developing procedures to guide the process of introducing changes to the environment.
- Clearly defining requirements for changes.
- Restricting changes to authorized users.

[28] In some cases, the institution provides remote access via VPN to a third-party service provider. Controls over third-party access should be commensurate with the sensitivity and criticality of the system and information accessed.

[29] An operating system is fundamental software that supports and manages software applications, allocates system resources, provides access and security controls, maintains file systems, and manages communications between end users and hardware devices.

[30] Middleware is software that connects two or more software components or applications.

- Reviewing the impact that changes have on security controls.
- Identifying all system components affected by the changes.
- Developing test scripts and implementation plans.
- Performing necessary tests of all changes to the environment (e.g., systems testing, integration testing, functional testing, user acceptance testing, and security testing).
- Defining rollback procedures in the event of unintended or negative consequences with the introduced changes.
- Ensuring the application or system owner has authorized changes in advance.
- Maintaining strict version control of all software updates.
- Validating that new hardware complies with institution policies.
- Ensuring network devices are properly configured and function appropriately within the environment.
- Maintaining an audit trail of all changes.

Refer to the *IT Handbook's* "Development and Acquisition" booklet for more information.

II.C.10(a) *Configuration Management*

Configuration management is a process to securely maintain the institution's technology by developing expected baselines for tracking, controlling, and managing systems settings. To mitigate information security risk, management should control configurations of systems, applications, and other technology. Effective configuration management relies on policies and procedures to ensure compliance with minimally acceptable system configuration requirements. When information systems change, management should update baselines; confirm security settings; and track, verify, and report configuration items. Configurations should be monitored for unauthorized changes, and misconfigurations should be identified. Management can use automated solutions to help track, manage, and identify necessary corrections.

II.C.10(b) *Hardening*

Institutions typically use commercial off-the-shelf (COTS) software for operating systems and applications, on such diverse platforms as network infrastructure, servers, desktops, laptops, and mobile devices. COTS systems generally provide more functions than are required for the specific purposes for which they are employed. A default installation of a server operating system may include mail, web, and file-sharing services on a system that does not require those functions. Unnecessary software and services represent a potential security weakness. Their presence increases the potential number of discovered and undiscovered vulnerabilities in the system. Additionally, system administrators may not install patches or monitor the unused software and services to the same degree as they would operational software and services. Protection against those risks begins when the systems are constructed and software installed through a process that is referred to as hardening a system.

Management should consult operating system and software vendor-recommended security controls. When deploying COTS applications and systems, management should harden the resulting applications and systems. Hardening can include the following actions:

- Determining the purpose of the applications and systems and documenting minimum software and hardware requirements and services to be included.
- Installing the minimum hardware, software, and services necessary to meet the requirements using a documented installation procedure.
- Installing necessary patches.
- Installing the most secure and up-to-date versions of applications.
- Configuring privilege and access controls by first denying all, then granting back the minimum necessary to each user (i.e., enforcing the principle of least privilege).
- Configuring security settings as appropriate, enabling allowed activity, and prohibiting non-approved activities.
- Enabling logging.
- Creating cryptographic hashes[31] of key files.
- Archiving the configuration and checksums[32] in secure storage before system deployment.
- Using secure replication procedures for additional, identically configured systems and making configuration changes on a case-by-case basis.
- Changing all default passwords.
- Testing the system to ensure a secure configuration.

Additionally, the systems should be audited periodically to ensure that the hardware, software, and services are authorized and properly configured.

II.C.10(c) *Standard Builds*

Consistency in system configuration makes security easier to implement and maintain. The institution should use standard builds, which allow one documented configuration to be applied to multiple computers in a controlled manner. Some institutions, depending on their size and complexity, may have many standard builds for the different system configurations needed to address various business functions. Through standard builds, an institution simplifies the following activities:

- Creating hardware and software inventories.
- Updating and patching systems.
- Restoring systems in the event of a disaster or outage.
- Investigating anomalous activity.
- Auditing configurations for conformance with the approved configuration.

The institution may not be able to meet all of its requirements from its standard builds. The use of nonstandard builds should be documented and approved by management, with appropriate changes made to patch management and disaster recovery plans.

[31] A hash is a fixed-length cryptographic output of variables, such as a message, being operated on by a formula or cryptographic algorithm.

[32] A checksum is a simple error-detection scheme in which each transmitted message is accompanied by a numerical value based on the number of set bits in the message, which allows the receiver to verify the accuracy of the message.

II.C.10(d) *Patch Management*

Frequently, security vulnerabilities are discovered in operating systems and other software after deployment. Hackers often will attempt to exploit these known vulnerabilities to try to gain access to the institution's systems. Third parties issue patches to address vulnerabilities found on institution systems and applications.[33] Management should implement automated patch management systems and software to ensure all network components (virtual machines, routers, switches, mobile devices, firewalls, etc.) are appropriately updated. In addition, management should use vulnerability scanners periodically to identify vulnerabilities in a timely manner.

As part of the institution's patch management process, management should establish and implement the following:

- A monitoring process that identifies the availability of software patches.
- A process to evaluate the patches against the threat and network environment.
- A prioritization process to determine which patches to apply across classes of computers and applications.
- A process for obtaining, testing, and securely installing patches, including in the institution's virtual environments.
- An exception process, with appropriate documentation, for patches that management decides to delay or not apply.
- A process to ensure that all patches installed in the production environment are also installed in the disaster recovery environment in a timely manner.
- A documentation process to ensure the institution's information assets and technology inventory and disaster recovery plans are updated as appropriate when patches are applied.

The institution should have procedures that include how to implement patches to mitigate risks of changing systems and address systems with unique configurations. Before applying a patch, management should back up the production system. Additionally, management should define appropriate patch windows and, whenever possible, restrict the implementation of patches to defined time frames to minimize business impact or potential down time.

Patches make direct changes to the software and configuration of each system to which they are applied. While patches are necessary and useful, they may have unintended negative consequences, such as introducing new vulnerabilities, reintroducing old vulnerabilities, or degrading system performance. The following actions can help ensure patches do not compromise the security of the institution's systems:

- Obtain the patch from a known, trusted source.
- Verify the integrity of the patch through comparisons of cryptographic hashes to ensure the patch obtained is correct and unaltered.
- Protect and monitor the systems used to distribute patches to ensure only authorized patches are distributed.

[33] If an institution develops or maintains software in-house, management should have a process to update the software with appropriate patches.

- Apply the patch to an isolated test system before installing on the production system to ensure the patch is compatible with other software used on systems, does not alter the system's security posture in unexpected ways (such as altering log settings), and corrects the pertinent vulnerability.
- Test the resulting system to validate the effectiveness of the applied patch.

II.C.11 End-of-Life Management

Management should plan for a system's life cycle, eventual end of life, and any corresponding security and business impacts. The institution's strategy should incorporate planned changes to systems, including an evaluation of the current environment to identify potential vulnerabilities, upgrade opportunities, or new defense layers. Also included in this strategy should be considerations for the support provided by third-party system vendors and the risks related to operating unsupported legacy systems. Management should have policies to manage both the hardware and software life cycles. Security risks related to reaching a system's end of life include (a) the increased potential for vulnerabilities because the third party no longer provides patches or support, (b) incompatibility with other systems in the institution's environment, and (c) limitations in security features in older or obsolete systems.

Effective end-of-life management should include the following:

- Maintaining inventories of systems and applications.
- Adhering to an approved end-of-life or sunset policy for older systems.
- Tracking changes made to the systems and applications, availability of updates, and the planned end of support by the vendor.
- Conducting risk assessments on systems and applications to help determine end-of-life.
- Planning for the replacement of systems nearing obsolescence and complying with policy requirements for implementing new systems or applications.
- Developing specific procedures for the secure destruction or data wiping of hard drives returned to vendors or donated, to prevent the inadvertent disclosure of sensitive information.

If an end-of-life system or application must remain in use, management should ensure appropriate mitigating controls are in place, which may include segregating the system or application from the network. Management should also have a plan to replace the system or application and implement compensating controls until replacement. Strategies for replacing and updating hardware and software should incorporate and align with overall information security and business strategies as appropriate.

II.C.12 Malware Mitigation

Attackers use malware to obtain access to an institution's environment and to execute an attack within the environment. Malware may enter through public or private networks and from devices attached to the network. Although protective mechanisms may block most malware before it does damage, even a single malicious executable[34] may create a significant potential for loss.

Management should implement defense-in-depth to protect, detect, and respond to malware. The institution can use many tools to block malware before it enters the environment and to detect it and respond if it is not blocked. Methods or systems that management should consider include the following:

- Hardware-based roots of trust, which use cryptographic means to verify the integrity of software.
- Servers that run active content at the gateway and disallow content based on policy.
- Blacklists that disallow code execution based on code fragments, Internet locations, and other factors that correlate with malicious code.
- White lists of allowed programs.
- Port monitoring to identify unauthorized network connections.
- Network segregation.
- Computer configuration to permit the least amount of privileges necessary to perform the user's job.
- Application sandboxing[35] to limit the access and functionality of executed code.
- Monitoring for unauthorized software and disallowing the ability to install unauthorized software.
- Monitoring for anomalous activity for malware and polymorphic code.
- Monitoring of network traffic.
- User education in awareness, safe computing practices, indicators of malicious code, and response actions.

II.C.13 Control of Information

Action Summary

Management should control and protect access to and transmission of information to avoid loss or damage and do the following:

- Establish and supervise compliance with policies for storing and handling information, including storing data on mobile devices and cloud services.
- Define and implement appropriate controls over the electronic transmission of information.
- Facilitate safe and secure disposal of sensitive information.
- Secure physical media in transit.

[34] In computing, an executable is a file or a program that is able to be run by a computer.

[35] Sandboxing is the use of a restricted, controlled execution environment that prevents potentially malicious software, such as mobile code, from accessing any system resources except those for which the software is authorized.

II.C.13(a) *Storage*

Management should implement policies to govern the secure storage of all types of sensitive information, whether on computer systems, on physical media, or in hard-copy documents. Management can achieve secure storage with physical controls,[36] logical controls (e.g., passwords, tokens, and biometrics), and environmental controls (e.g., fire and flood protection). In addition, stored information, in any form, should be classified and inventoried so that it can be retrieved when needed. Inventories should be updated periodically to remain current.

More sensitive information, such as system documentation, application source code, and production transaction data, should have more extensive controls to guard against alteration (e.g., integrity checkers and cryptographic hashes). Management should have appropriate logging and monitoring controls over stored information to ensure authorized access and appropriate use. Periodically, the security staff, audit staff, and data owners should review access rights to ensure the access rights remain appropriate and current.

Data storage in portable devices, such as laptops, smart phones, and tablets, poses unique problems. These devices may be lost, stolen, or subject to unauthorized and undetected use. Risk mitigation typically involves data encryption, host-provided access controls, homing beacons,[37] and remote deletion[38] capabilities. Management should implement appropriate controls (such as the use of a DLP program) over portable devices and the sensitive information contained on them.

Many institutions create or use a third-party cloud for storage. Cloud storage[39] provides unique issues and challenges. Management should understand the nature of the cloud technology being used; the physical location(s) where the data are stored and related legal jurisdiction; the access controls used and protection of the institution’s data (e.g., how access is controlled and how that information is retrieved); and the frequency and method of backup used by the cloud provider. Management should verify that the cloud provider offers the capability for the institution to monitor its system activity, significant security incidents, performance and uptime, and success and failure of backups.

II.C.13(b) *Electronic Transmission of Information*

Electronic transmission of information can include e-mail, file transfer protocol (FTP), secure FTP (sFTP), secure shell, dedicated line, short message service/texting, and transmission via the Internet. Management should determine the type of transmission method, sensitivity of the

[36] Refer to the “Physical Security” section of this booklet.

[37] Homing beacons send messages to the institution when they connect to a network and enable recovery of the device.

[38] Remote deletion is a technology that enables the institution to remotely delete certain data from a portable device.

[39] Cloud storage is a model of data storage in which the digital data are stored in logical pools, the physical storage spans multiple servers (and often locations), and the physical environment is typically owned and managed by a hosting company.

information to be transmitted, and types of safeguards available to protect information. Management should implement appropriate controls or, if they are not available, restrict the type of information that can be transmitted. When transmitting sensitive information over a public network, information should be encrypted to protect it from interception or eavesdropping. Techniques include secure e-mail protocols, sFTP, and secure sockets layer (SSL) certificates.

II.C.13(c) *Disposal of Information*

The institution should have appropriate disposal procedures for paper-based and electronic information.[40] Designating a single individual, department, or function to be responsible for disposal facilitates accountability and promotes compliance with disposal policies.

Policies should prohibit employees from discarding paper-based information containing sensitive information by using the same disposal system as regular garbage to avoid accidental disclosure. Many institutions shred paper-based media on-site while others use collection and disposal services to ensure the media are rendered unreadable and unlikely to be reconstructed. Institutions that contract with third-party service providers should conduct due diligence to ensure those third parties conduct adequate employee background checks and employ appropriate controls. Contracts with third-party disposal firms should address acceptable disposal procedures.

Electronic information and computer-based media present distinct disposal challenges. In addition to disk drives and other forms of storage, information frequently is contained in or on the memory of other devices (e.g., printers, fax machines, and cellphones). Residual data frequently remain on media, even after deletion. Because the data can be recovered, additional disposal techniques should be applied to devices containing sensitive data. Overwriting destroys data by replacing it with new, random data. Overwriting may be preferable when the media will be reused. To be effective, overwriting may have to be performed many times.

Another disposal technique is degaussing, which scrambles the data recorded on the media with powerful, varying magnetic fields. Physical destruction of the media can make the data unrecoverable. Data can sometimes be destroyed after overwriting. Management should determine the most effective method of disposal based on the type of information. Policies and procedures should address making data non-recoverable. The institution should base its disposal policies on the sensitivity of the information. Policies, procedures, and training should inform employees about what actions should be taken to securely dispose of computer-based media and protect the data from the risks of reconstruction. Management should log the disposal of sensitive media. Logs should record the party responsible for disposal, as well as the date, media type, hardware serial number, and method of disposal. In cases when such devices are rented, rather than owned, by the institution, media sanitization should be addressed contractually so that sensitive information is disposed of properly before returning equipment at the end of the rental period.

[40] See also Information Security Standards, section III.C.4., requiring each financial institution to develop, implement, and maintain, as part of its information security program, appropriate measures to properly dispose of "customer information" and "consumer information."

II.C.13(d) *Transit of Physical Media*

Management should implement policies for maintaining the security of physical media (including backup tapes) containing sensitive information while in transit, including to off-site storage, or when shared with third parties. Policies should include the following:

- Contractual requirements that incorporate necessary risk-based controls.
- Restrictions on the carriers used.
- Procedures to verify the identity of couriers.
- Requirements for appropriate packaging to protect the media from damage.
- Use of adequate encryption of sensitive information recorded on media that is being physically transported.
- Tracking of shipments to provide early indications of loss or damage.
- Security reviews or independent security reports of receiving companies.
- Use of nondisclosure agreements for couriers and third parties.

II.C.13(e) *Rogue or Shadow IT*

Management should have policies explaining that employees should not and are not authorized to use unsanctioned or unapproved IT resources (e.g., online storage services, unapproved mobile device applications, and unapproved devices). Security awareness or information security training should include procedures for identifying and reporting shadow IT.

II.C.14 Supply Chain

The typical institution purchases a wide variety of hardware and software, which often is manufactured or developed internationally. In a supply chain attack, a threat source incorporates unidentified and harmful features into the purchased items before delivery. During the risk identification process, management should identify factors that may increase risk from supply chain attacks and respond with appropriate risk mitigations. An effective information security program seeks to limit the potential for harm through techniques tailored to specific acquisitions and services. Examples of techniques to mitigate the risk from such attacks include the following:

- Only making purchases through reputable sellers who demonstrate an ability to control their own supply chains.
- Purchasing hardware and software through third parties to shield the institution’s identity.
- Reviewing hardware for anomalies.
- Using automated software testing and code reviews for software.
- Regularly reviewing the reliability of software and hardware items purchased through activity monitoring and evaluations by user groups.

II.C.15 Logical Security

Action Summary

Management should have an effective process to administer logical security access rights for the network, operating systems, applications, databases, and network devices, which should include the following:

- Assigning users and devices the access required to perform required functions.
- Updating access rights based on personnel or system changes.
- Reviewing users' access rights at an appropriate frequency based on the risk to the application or system.
- Designing appropriate acceptable-use policies and requiring users to agree to them.
- Controlling privileged access.
- Changing or disabling default user accounts and passwords.

System devices, programs, and data are system resources. Because users may access these resources through the institution's network, management should identify and restrict logical access to all system resources to the minimum required for legitimate and approved work activities, according to the principle of least privilege. Access beyond the minimum required for work to be performed exposes the institution's systems and information to a potential loss of confidentiality, integrity, and availability. The institution's logical security policy and procedures should address access rights and how those rights are to be administered. Management and system administrators should regularly evaluate information system access.

Logical user access rights administration consists of three processes:

- Enrolling new users to the system.
- Authorizing modifications to user access and deletions.
- Monitoring access rights granted to each user, including periodic review and validation of access rights.

The enrollment process establishes the user's identity and anticipated business needs for information and systems. Management should identify and evaluate all users, including new employees, IT outsourcing relationships, and contractors. The assignment of access rights is typically performed by the employee's manager and the application or data owners responsible for each accessed resource, with documented approval. The assignment of rights may also be established by the employee's role or group membership, which confers certain user access rights.

Management should have an authorization process to enable the employee's manager and the application or data owners to modify or delete existing user access rights to information and systems. The authorization process should include controls to verify that proper authorizations were granted or removed. Modifications to access rights should occur when an individual's business needs change. Job changes can result in an expansion, reduction, or deletion of needed access rights. Job changes that could trigger a modification or deletion of access rights include transfers, mandatory leave, resignations, and terminations. The institution should promptly review, and modify as needed, access rights for all users who experience job changes, particularly those with privileged access, remote access privileges, and access to customer information.

As part of the user access rights monitoring process, management should perform regular reviews to validate user access. Reviews should test whether access rights continue to be appropriate or whether they should be modified or deleted. Management should review access rights on a schedule commensurate with risk.

Logical user access rights administration also constrains user activities through an acceptable use policy that details permitted system uses, user activities, and the consequences of noncompliance. Management should maintain an acceptable use policy, and employees should be required to acknowledge and agree in writing to the policy. When implemented correctly, an acceptable use policy is a key control for user awareness and administrative policing of system activities. Elements of an acceptable use policy can include the following:

- Specific access devices that can be used to access the network.
- Hardware and software changes the user can make to his or her access device.
- Purpose and scope of network activity.
- Permitted network services.
- Information that can or cannot be transmitted, and authorized transmission methods.
- Bans on attempts to break into accounts, crack passwords, or disrupt service.
- Responsibilities for secure operation.
- Consequences of noncompliance.

Authorization for privileged access should be tightly controlled. Privileged access refers to the ability to override system or application controls, and may include system administrator access. All individuals who are granted privileged access should have the appropriate training commensurate with the risk and complexity of the systems and information they access. Prudent practices for controlling privileged access include the following:

- Identifying each privilege associated with each system resource.
- Implementing a process to allocate privileges on a need-to-use or an event-by-event basis.
- Documenting the granting and extent of privileged access.
- Assigning privileges to a unique user ID apart from the one used for normal business use.
- Prohibiting shared privileged user accounts.
- Logging and independent monitoring of the use of privileged access.
- Reviewing, by an independent party, privileged access rights and allocations at appropriate intervals.

Access rights to new software and hardware present a different problem. Typically, hardware and software are shipped with default users and at least one default user has privileged access. Lists of default accounts and passwords are readily available and can enable anyone with access to the system to obtain privileged access. These passwords should be changed, and the accounts should be disabled. Alternately, if these accounts are not disabled, access should be monitored closely.

II.C.15(a) *Operating System Access*

Access to the operating system and system utilities provide users with the authority to make fundamental changes to the system. System utilities are programs that perform repetitive functions, such as creating, deleting, changing, or copying files. System utilities also could include numerous types of system management software that can supplement operating system functionality by supporting common system tasks, such as security, system monitoring, or transaction processing.

Unauthorized access to the operating system and system utilities could result in significant financial and operational losses. System and security administrators should restrict and monitor privileged access to operating systems and system utilities. Many operating systems have integrated or third-party access control software, which is often essential to effective access control and can be used to integrate the security management of the operating system and applications. To prevent unauthorized access to or inappropriate activity on the operating system and system utilities, management should do the following:

- Implement effective user access to appropriately restrict system access for both users and applications and, depending on the sensitivity, extend protection at the program, file, record, or field level.
- Limit the number of employees with access to operating systems and grant only the minimum level of access required to perform job responsibilities.
- Restrict and log access to and activity on operating system parameters, system utilities (especially those with data-altering capabilities), and sensitive system resources (including files, programs, and processes), and supplement with additional security software, as necessary.
- Restrict operating system access to specific terminals in physically secure and monitored locations.
- Secure or remove external drives and portable media from system consoles, terminals, or personal computers (PC) running terminal emulations, residing outside of physically secure locations.
- Prohibit remote access to operating system and system utilities, where feasible, and, at a minimum, require strong authentication and encrypted sessions before allowing such remote access.
- Filter and review logs for potential security events and provide adequate reports and alerts.
- Independently monitor operating system access by user, terminal, date, and time of access.

II.C.15(b) *Application Access*

Sensitive or mission-critical applications should incorporate appropriate access controls that restrict which functions are available to users and other applications. These access controls allow authorized users and other applications to interface with related databases. Some security software programs integrate access control between the operating system and some applications.

Such software is useful when applications do not have their own access controls or when the institution uses security software instead of the application's native access controls. Management should understand the functionality and vulnerabilities of the application access control solutions and consider those issues in the risk management process.

Management should implement effective application access controls by doing the following:

- Implementing a robust authentication[41] method consistent with the criticality and sensitivity of the application.
- Easing the administrative burden of managing application access rights by using group profiles. Managing access rights individually can lead to inconsistent or inappropriate access levels.
- Periodically reviewing and approving the application access assigned to users for appropriateness.
- Communicating and enforcing the responsibilities of programmers, security administrators, and application owners for maintaining effective application access control.
- Setting time-of-day or terminal limitations for some applications or for more sensitive functions within an application.
- Logging access and events, defining alerts for significant events, and developing processes to monitor and respond to anomalies and alerts.

II.C.15(c) *Remote Access*

Management should develop policies to ensure that remote access by employees, whether using institution or personally owned devices, is provided in a safe and sound manner. Such policies and procedures should define how the institution provides remote access and the controls necessary to offer remote access securely. Management should employ the following measures:

- Disable remote communications if no business need exists.
- Tightly control remote access through management approvals and subsequent audits.
- Implement robust controls over configurations at both ends of the remote connection to prevent potential malicious use.
- Log and monitor all remote access communications.
- Secure remote access devices.
- Restrict remote access during specific times.
- Limit the applications available for remote access.
- Use robust authentication methods for access and encryption to secure communications.

There are several methods to provide remote access to employees. A prevalent form of remote access is through a VPN, which provides employees with a remote connection to the institution's network through a secure channel. The VPN connection uses public telecommunication infrastructure, such as the Internet, to provide remote offices or individual users with secure

[41] Stronger authentication and layered security methods, such as the use of tokens, public-key infrastructure-based systems, or out-of-band verification coupled with a robust identity and access management process, can reduce the potential for unauthorized access.

access to their organization's network. VPN provides an encrypted isolated “tunnel” or connection between a remote user’s computer and the internal network.

Because VPN connections provide access to sensitive internal networks, the connections require additional authentication from the remote user. Use of physical token devices is a common method that can provide one-time passwords to strongly authenticate remote users.

While VPNs effectively connect the remote computer to the internal network, other alternatives provide virtual desktop capability. In these cases, the remote computer connects to a special purpose software system (sometimes a website), authenticates the user, and establishes a secure connection to an internal network server. That server establishes a local internal network desktop session and connects it to the screen, keyboard, mouse, and speakers of the remote computer. This is an actual remote control environment, where the remote user’s actions have the same effect as if connected to an actual internal network desktop. The remote control configuration may permit file transfer between the remote and internal computers. If the remote access method allows users to store sensitive institution information, management should consider limiting this access to institution-owned devices.

Other methods of remote access are available, including remote control software and third-party services, file transfer software (e.g., FTP), conferencing/session sharing tools, and other remote desktop software. Management should conduct a risk assessment and implement appropriate controls before adopting any remote access solution.

If the institution allows employees to use authorized remote access methods with institution-owned devices, management should implement the following mitigating controls:

- Prevent users from installing software on the devices.
- Prohibit users from having administrative privileges on the devices.
- Use firewalls, host-based IDS, and packet content filtering to identify, monitor, and limit remote access activities.

II.C.15(d) *Use of Remote Devices*

Management may choose to allow employees to connect remotely to the institution’s network using either an institution-owned or a personally owned device (often referred to as BYOD or “bring your own device”). Institution-owned devices are easier to secure because the institution controls the devices’ configuration and often can implement remote wiping if the devices are lost or stolen. It may be more difficult to implement remote wiping or a similar measure on an employee’s personally owned device. BYOD is becoming more popular, however, with institutions and employees because it reduces costs to the institution and enables employees to carry one device instead of two.

For all remote devices, management should do the following to control employee remote access to the institution’s network:

- Disallow remote access unless a compelling business justification exists.

- Require management approval of employee remote access.
- Regularly review remote access approvals and rescind those that no longer have a compelling business justification.
- Restrict remote access to authorized network areas and applications by using VLANs, permissions, and other techniques.
- Log remote access communications (including date, time, user, user location, duration, and activity), analyze logs in a timely manner, and follow up on anomalies.
- Implement robust authentication methods for remote access.
- Use encryption to protect communications between the access device and the institution.
- Use application white-listing.[42]

For institution-owned devices, the institution should have the ability to manage the remote devices. The following controls should be implemented:

- Securely configure remote access devices.
- Protect remote access devices against malware.
- Patch, update, and maintain all software on remote access devices.
- Encrypt sensitive data residing on the access device.
- Implement secure containers with internal boundaries to store sensitive information, in a way that is not accessible to the device without permission.
- Periodically audit the access device configurations and patch levels.
- Remotely disable or wipe the device in the event of theft or loss.
- Use geolocation of the device to support device recovery efforts.

For personally owned devices, the institution may not have the ability to configure the devices; therefore, management should have an effective method or solution to ensure that such devices meet defined institution security standards, such as operating system version, patch levels, and anti-malware solutions, before such devices are allowed to log on to the network.

II.C.16 Customer Remote Access to Financial Services

Action Summary

Management should do the following:

- Develop and maintain policies and procedures to securely offer and strengthen the resilience of remote financial services, if the institution offers such services.
- Plan for actions that adversely affect the availability of remote banking services to customers.
- Coordinate appropriate responses with the institution’s ISPs and third-party service providers.
- Regularly test the institution’s response plans.

[42] Application white-listing is the maintenance and use of a list of applications and their components (e.g., libraries and configuration files) that are authorized to be present or active on a system according to a well-defined baseline.

Institutions increasingly offer services to customers through remotely accessible technology, such as the Internet and mobile financial services. If the institution offers such services, management should implement appropriate authentication techniques[43] commensurate with the risk from remote banking activities. Beyond authentication, remote access controls should include additional layered security controls and may include some combination of the following:

- Application time-outs with mandatory re-authentication.
- Fraud detection and monitoring systems that include consideration of customer history and behavior to alert management, and enable a timely and effective institution response.
- Dual customer authorization through different access devices.
- Out-of-band[44] verification for transactions.
- Positive pay,[45] debit blocks, and other techniques to appropriately limit the transactional use of the account.
- Supplementary controls over certain account activities, such as transaction value limits, restrictions on devices for adding payment recipients, limits on the number of transactions allowed per day, and allowable payment windows (e.g., days and times).
- Reputation-based tools to block connections to the institution's servers based on device or network indicators known or suspected to be associated with fraudulent activities.
- Device authentication with appropriate enrollment and de-enrollment processes.
- Policies for addressing customer devices identified as potentially compromised and identifying customers who may be facilitating fraud.
- Controls over changes to account maintenance activities (e.g., address or password changes) performed by customers either online or through customer service channels.
- Supplementary controls for system administrators who are granted privileges to set up or change system configurations of business accounts.[46]
- Customer education to increase awareness of the fraud risk and effective techniques customers can use to mitigate the risk.

Institution customers may also use e-mail or other electronic means to transmit instructions. All instructions received through such channels should be authenticated and validated in accordance with institution policies.

An area of heightened concern when financial institutions offer remote financial services is the potential for malicious activity against the institution's mobile or online services. Malicious actors may restrict availability to those services through denial of service (DOS) attacks that target the institution's ISPs, third-party service providers, infrastructure, or applications.

[43] Techniques include multiple factor authentication, device authentication, location consistency, and additional authentication for sensitive functions.

[44] Out-of-band refers to activity outside of the primary means of interfacing with the customer. For example, if a user is performing activity online, he or she may be authenticated through a one-time password sent via text message.

[45] Positive pay is a technique that can reduce check fraud by requesting businesses to send electronic files of information to the financial institution on all checks the business has issued.

[46] Refer to the FFIEC's "Supplement to Authentication in an Internet Banking Environment."

Additionally, attacks on organizations that share infrastructure with the institution, including domain name services, may adversely affect the availability of remote services. Management should develop and maintain policies and procedures to identify, measure, mitigate, monitor, and report on significant security incidents to ensure the resilience of remote financial services. Planning and coordination by the institution and its third-party service providers may improve the resilience of services in the face of those attacks. To prevent or minimize exposure to these incidents, management should do the following:

- Monitor threat alerts.
- Monitor service availability and diagnose causes of reduced availability.
- Monitor applications and network traffic for indicators of nefarious activity.
- Ensure traffic filtering by the institution's ISP or upstream ISP,[47] third-party service providers, and internal resources.
- Design and implement applications to withstand application-level DOS.
- Utilize distributed architecture.
- Limit traffic (e.g., allow valid traffic and block known bad traffic by port or IP address).
- Add bandwidth.
- Enable access to services through alternative channels.

The institution should develop and test an incident response plan in conjunction with the institution's ISPs and third-party service providers to mitigate the interruption of mobile or remote financial services. Refer to the "Incident Response" section of this booklet for more information.

Customers may be provided with a website disclosure with the institution's customer acceptable-use policy. Depending on the nature of the website, the institution may require customers to demonstrate knowledge of and agreement to abide by the terms of the acceptable use policy. That evidence can be paper-based or electronic.

Refer to appendix E[48] of the *IT Handbook's* "Retail Payment Systems" booklet for more information about mobile financial services.

II.C.16(a) *Customer Awareness*

The institution's customer awareness and education efforts should consider both retail and commercial account holders and include the following elements:

- An explanation of protections provided, and not provided, to account holders relative to electronic funds transfers under Regulation E, and a related explanation of the applicability of Regulation E to the types of accounts accessible online.

[47] An upstream ISP is usually a large ISP that provides Internet access to a local ISP.

[48] See the *IT Handbook's* "Retail Payment Systems" booklet, appendix E, "Mobile Financial Services."

- An explanation that while the institution may contact a customer regarding his or her account or suspicious activities related to his or her account, the institution should never ask the customer to provide his or her log-in credentials over the phone or via e-mail.
- A list of recommended controls and prudent practices that the customer should implement when using the institution's remote financial services.
- A suggestion that commercial online customers perform a related risk assessment and controls evaluation periodically.
- Recommendations of technical and business controls to commercial customers that can be implemented to mitigate the risks from fraud schemes such as Business Email Compromise.[49]
- A method to contact the institution if customers notice suspicious account activity.

II.C.17 Application Security

Action Summary

Management should use applications that have been developed following secure development practices and that meet a prudent level of security. Management should develop security control requirements for all applications, whether the institution acquires or develops them. Information security personnel should be involved in monitoring the application development process to verify that secure development practices are followed, security controls are implemented, and information security needs are met.

Institutions and their customers use a wide variety of applications. Such applications include core banking applications, web applications, and installable applications (e.g., downloadable mobile applications).

A secure software development life cycle ensures that Internet- and client-facing applications have the necessary security controls. The institution should ensure that all applications are securely developed. To verify the controls have been developed and implemented appropriately, management should perform appropriate tests (e.g., penetration tests, vulnerability assessments, and application security tests) before launching or making significant changes to external-facing applications. Issues noted from tests should be remediated before launching applications or moving changes into production. At institutions that employ third parties to develop applications, management should ensure that the third parties meet the same controls.

Applications should provide the ability for management to do the following:

- Implement a prudent set of security controls (e.g., password and audit policies), audit trails of security and access changes, and user activity logs for all applications.
- Establish user and group profiles for applications if not part of a centralized identity access management system.

[49] See Federal Bureau of Investigation, Alert I-012215-PSA.

- Change and disable default application accounts upon installation.
- Review and install patches for applications in a timely manner.
- Implement validation controls for data entry[50] and data processing.[51]
- Integrate additional authentication and encryption controls, as necessary, to ensure integrity and confidentiality of data and non-repudiation of transactions.
- Protect web or Internet-facing applications through additional controls, including web application firewalls, regular scanning for new or recurring vulnerabilities, mitigation or remediation of common security weaknesses, and network segregation to limit inappropriate access or connections to the application or other areas of the network.
- Mitigate risks from potential flaws in applications allowing remote access by customers and others through network, host, and application layer architecture considerations.
- Obtain attestation or evidence from third-party developers that the application acquired by the institution meets the necessary security requirements and that noted vulnerabilities or flaws are remediated in a timely manner.
- Perform ongoing risk assessments to consider the adequacy of application-level controls in light of changing threat, network, and host environments.
- Implement minimum controls recommended by the third-party service provider and consider supplemental controls as appropriate.
- Review available audit reports, and consider and implement appropriate control recommendations
- Collect data to build metrics and reporting of configuration management compliance, vulnerability management, and other measurable items as determined by management.

Whether the institution acquires or develops applications, management should establish security control requirements for new systems, system revisions, or new system acquisitions. Management should define the security control requirements based on its risk assessment process and evaluate the value of the information at risk and the potential impact of unauthorized access or damage within existing software development and acquisition processes. Management should have a process to determine risks posed by the system and necessary security requirements. Management may also refer to published, widely recognized industry standards as a starting point for establishing the institution's security requirements.

Information security personnel should be involved from the outset in the application development process to determine whether security controls are designed, tested, and implemented and information security needs are being met. Monitoring the development environment can help ensure that the implemented controls are functioning properly. Institutions that purchase applications typically rely on third-party service providers to develop applications with appropriate security built-in; management, however, should perform its own verification to

[50] Data entry validation controls include access controls over entry and changes to data, error checks, review of suspicious or unusual data, and dual entry or additional review and authorization for highly sensitive transactions or data.

[51] Data processing controls include batch control totals, hash totals of data for comparison after processing, identification of any changes made to data outside the application (e.g., data-altering utilities), and job control checks to ensure programs run in correct sequence.

determine whether the application meets the institution's security requirements. Management should analyze the environment where the application will reside. As the environment changes, the security requirements and assurance needs for the application may also change. Management should leverage available resources[52] to assist in risk identification and improve the institution's application security practices.

II.C.18 Database Security

Action Summary

Management should implement effective controls for databases and restrict access appropriately.

Databases are collections of information organized to be easily accessed, managed, and updated. Databases can be developed in-house or purchased from third parties and have their own controls and protective mechanisms configured to provide varying levels of protection. Along with many other security features, encryption helps to protect the stored information from theft or unauthorized viewing. Management should implement or enable controls commensurate with the sensitivity of the data stored in or accessed by the database.

Database users may be people (e.g., employees, customers, and contractors) or other applications. Users have different levels of access and authorization. Some users may have extensive privileges, including the ability to change the database configuration and access controls. Other users may have restrictions in what they can view, manipulate, or store. When a person is the database user, authorizations can be tailored to that person, greatly limiting the amount of information that could be exposed in a security incident. When an application is the database user, the access granted to the application can be more extensive than a person would require. Accordingly, an attack on a database through an application could expose a larger and more damaging collection of data. For application accounts, management should strengthen authentication and monitoring requirements to minimize the potential for unauthorized use.

Management should appropriately control user access and apply the principle of least privilege in assigning authorizations. The use and overall configuration of a database's security features should be part of a well-designed, layered security program.

II.C.19 Encryption

Action Summary

Management should implement the type and level of encryption commensurate with the sensitivity of the information.

[52] Resources include software tools, industry resources, specific certifications, and education courses.

Encryption is used to secure communications and data storage, particularly authentication credentials and the transmission of sensitive information. Encryption can be used throughout a technological environment, including the operating systems, middleware, applications, file systems, and communications protocols.

Encryption can be used as a preventive control, a detective control, or both. As a preventive control, encryption acts to protect data from disclosure to unauthorized parties. As a detective control, encryption is used to allow management to discover unauthorized changes to data. When prevention and detection are joined, encryption can be an important control in ensuring confidentiality, integrity, and availability.

Institution management should employ encryption strength sufficient to protect information from disclosure. Encryption methods should be reviewed periodically to ensure that the types and methods of encryption are still secure as technology and threats evolve. Decisions regarding what data to encrypt and at what points to encrypt the data are typically based on the risk of disclosure and the costs of encryption. The need to encrypt data is determined by the institution's data classification and risk assessment.

Passwords should be hashed or encrypted in storage. Passwords that are hashed also should be salted.[53] Files containing encrypted or hashed passwords used by systems to authenticate users should be readable only with elevated (or administrator) privileges.

Key management[54] is crucial to the effective use of encryption. Effective key management systems rely on an agreed set of standards, procedures, and secure methods that address the following:[55]

- Generating keys for different cryptographic systems and different applications.
- Generating and obtaining public keys.
- Distributing keys to intended users, including how keys should be activated when received.
- Storing keys, including how authorized users obtain access to keys.
- Changing or updating keys, including rules on when and how keys should be changed.
- Addressing compromised keys.
- Archiving, revoking, and specifying how keys should be withdrawn or deactivated.
- Recovering keys that are lost or corrupted as part of business continuity management.
- Logging the auditing of key management-related activities.
- Instituting defined activation and deactivation dates, and limiting the usage period of keys.

[53] In password protection, salt is a random string of data used to modify a password hash.

[54] Key management is the management of cryptographic keys. This includes dealing with the generation, exchange, storage, use, and replacement of keys.

[55] Refer to ISO/IEC 11770-1:2010, "Key Management—Part 1: Framework"; ISO/IEC 11770-2:2008, "Key Management—Part 2: Mechanisms Using Symmetric Techniques"; and ISO/IEC 11770-3:2015, "Key Management—Part 3: Mechanisms Using Asymmetric Techniques."

II.C.20 Oversight of Third-Party Service Providers

Action Summary

Management should oversee outsourced operations through the following:

- Appropriate due diligence in third-party research, selection, and relationship management.
- Contractual assurances for security responsibilities, controls, and reporting.
- Nondisclosure agreements regarding the institution's systems and data.
- Independent review of the third party's security through appropriate reports from audits and tests.
- Coordination of incident response policies and contractual notification requirements.
- Verification that information and cybersecurity risks are appropriately identified, measured, mitigated, monitored, and reported.

Management should conduct appropriate due diligence in selecting and monitoring third-party service providers. Management should be responsible for ensuring that such third parties use suitable information security controls when providing services to the institution. When indicated by the institution's risk assessment, management should monitor third-party service providers to confirm that they are maintaining appropriate controls. If the third-party service provider stores, transmits, processes, or disposes of customer information, management should require third-party service providers by contract to implement appropriate measures designed to meet the Information Security Standards.

Management should evaluate information security considerations of potential third-party service providers during initial due diligence. Refer to the *IT Handbook's* "Outsourcing Technology Services" booklet for more information.

Management should verify that third-party service providers implement and maintain controls sufficient to appropriately mitigate risks. The institution's contracts should do the following:

- Include minimum control and reporting standards.
- Provide for the right to require changes to standards as external and internal environments change.
- Specify that the institution or an independent auditor has access to the service provider to perform evaluations of the service provider's performance against the Information Security Standards.

Refer to the "Third-Party Reviews of Technology Service Providers" section of the *IT Handbook's* "Audit" booklet for more information.

Additionally, as part of the oversight of third-party service providers, management should determine whether cyber risks are identified, measured, mitigated, monitored, and reported by such third parties as third-party cyber threats can have an impact on the institution. Information security reporting by the institution should incorporate an assessment of these third-party risks to facilitate a comprehensive understanding of the institution's exposure to third-party cyber threats.

II.C.20(a) *Outsourced Cloud Computing*

As with other forms of outsourcing, information security implications are key in the cloud computing model. Management may need to revise information security policies, standards, and procedures to incorporate the activities related to a cloud computing service provider. Refer to the FFIEC's "Outsourced Cloud Computing" statement for more information.[56]

II.C.20(b) *Managed Security Service Providers*

Management may rely on third parties to provide security services; management, however, remains responsible for ensuring the security of the institution's systems and information by overseeing the effectiveness of the services provided by the managed security services provider. Additional information is available in appendix D of the *IT Handbook's* "Outsourcing Technology Services" booklet.

II.C.21 Business Continuity Considerations

Action Summary

Management should do the following:

- Identify personnel who will have critical information security roles during a disaster, and train personnel in those roles.
- Define information security needs for backup sites and alternate communication networks.
- Establish and maintain policies that address the concepts of information security incident response and resilience, and test information security incident scenarios.

Business continuity plans should be reviewed as an integral part of the security process. Strategies should consider the different risk environments and the degree of risk mitigation necessary to protect the institution if continuity plans must be implemented. Management should train personnel regarding their security roles during a disaster. Additionally, management should update technologies and plans for backup sites and communications networks. These security considerations should be integrated with the testing of the business continuity plan.

Information security events may trigger activation of the business continuity plan. Therefore, the institution's plan should include steps that explicitly address information security incident response and resilience. Resilience testing should incorporate information security event scenarios identified by the institution.

Refer to the *IT Handbook's* "Business Continuity Planning" booklet for more information.

[56] See FFIEC, "Outsourced Cloud Computing," July 10, 2012.

II.C.22 Log Management

Network and host activities typically are recorded on the host and sent across the network to a central logging repository. The data that arrive at the repository are in the format of the software that recorded the activity. The logging repository may process the data and can enable timely and effective log analysis. Management should have effective log retention policies that address the significance of maintaining logs for incident response and analysis needs.

Log files are critical to the successful investigation and prosecution of security incidents and can potentially contain sensitive information. Intruders often attempt to conceal unauthorized access by editing or deleting log files. Therefore, institutions should strictly control and monitor access to log files whether on the host or in a centralized logging repository. Considerations for securing the integrity of log files include the following:

- Encrypting log files that contain sensitive data or that are transmitted over the network.
- Ensuring adequate storage capacity to avoid gaps in data gathering.
- Securing backup and disposal of log files.
- Logging the data to a separate, isolated computer.
- Logging the data to read-only media.
- Setting logging parameters to disallow any modification to previously written data.
- Restricting access to log files to a limited number of authorized users.

Additionally, logging practices should be reviewed periodically by an independent party to ensure appropriate log management.

Logs are voluminous and challenging to read. They come from a variety of systems and can be difficult to manage and correlate. Security information and event management (SIEM) systems can provide a method for management to collect, aggregate, analyze, and correlate information from discrete systems and applications. Management can use SIEM systems to discern trends and identify potential information security incidents. SIEM systems can be used to gather information from the following:

- Network and security devices and systems.[57]
- Identity and access management applications.
- Vulnerability management and policy compliance tools.
- Operating system, database, and application logs.
- Physical and environmental monitoring systems.
- External threat data.

Regardless of the method of log management, management should develop processes to collect, aggregate, analyze, and correlate security information. Policies should define retention periods for security and operational logs. Institutions maintain event logs to understand an incident or cyber event after it occurs. Monitoring event logs for anomalies and relating that information

[57] These can include intrusion detection and prevention systems, DLP solutions, and firewalls.

with other sources of information broadens the institution’s ability to understand trends, react to threats, and improve reports to management and the board.

II.D Risk Monitoring and Reporting

Risk monitoring is a process by which the institution tracks information about its inherent risk profile and identifies gaps in the effectiveness of risk mitigation activities. Risk monitoring should address changing threat conditions in both the institution and the greater financial industry. Threats change frequently, particularly in terms of the threat’s capabilities and intentions, as well as the vulnerabilities they may exploit. Vulnerabilities in software are continually announced, and other vulnerabilities may emerge as the institution’s systems are modified or updated. External requirements, including the use of new third-party service providers, also may change the institution’s inherent risk profile.

Risk reporting is a process that produces information systems reports that address threats, capabilities, vulnerabilities, and inherent risk changes. Risk reporting should describe any information security events that the institution faces and the effectiveness of management’s response and resilience to those events. The reporting process should provide a method of disseminating those reports to appropriate members of management. The contents of the reports should prompt action, if necessary, in a timely manner to maintain appropriate levels of risk.

II.D.1 Metrics

A mature and effective information security program uses metrics to improve the program’s effectiveness and efficiency. Management should develop metrics that demonstrate the extent to which the security program is implemented and whether the program is effective. Metrics are used to measure security policy implementation, conformance with the information security program, the adequacy of security services delivery, and the impact of security events on business processes. The measurement of security characteristics can allow management to increase control and drive improvements to the security process. Metrics generally are formed to measure conformance to the standards and procedures that are used to implement policies.

Management should utilize metrics to quantify and report risks of the information security program. Metrics should be gathered from external sources and internal data. The scope of metrics should be comprehensive and commensurate with the complexity of the institution’s operations. Reports should incorporate metrics tailored for different audiences and stakeholders. These metrics and other monitoring reports of the information security program should feed into ITRM reporting.

III Security Operations

Action Summary

Management should design policies and procedures to effectively manage security operations with the following characteristics:

- Broadly scoped to address all ongoing security-related functions.
- Guided by defined processes.
- Integrated with lines of business and third parties.
- Appropriately staffed and supplied with technology for continual incident detection and response activities.

Security operations involve a wide range of activities. Those activities may be centralized in a security operations center, distributed within the information security department and business lines, or outsourced in whole or in part. Security operations activities can include the following:

- Security software and device management (e.g., maintaining the signatures on signature-based devices and firewall rules).
- Forensics (e.g., analysis of potentially compromised systems).
- Threat identification and assessment.
- Vulnerability identification (e.g., operation or supervision of vulnerability scans, self-assessments, penetration tests, and analysis of audit results).
- Vulnerability cataloging and remediation tracking.
- Physical security management (e.g., CCTV, guards, and badge systems).
- Law enforcement interface (e.g., data retention and lawful intercepts).
- Third-party integration (e.g., managed security services and incident detection services).
- Network, host, and application activity monitoring.
- Analysis of threat intelligence from external sources.
- Engagement with information sharing groups.
- Incident detection and management.
- Enforcement of access controls.

Management should establish defined processes and appropriate governance to facilitate the performance of security operations. Policies should address the timing and extent of the security operations activities, reporting, escalation triggers, and response actions. Many institutions use an issue tracking system[58] to record and manage requests and events. An issue tracking system can be a source of evidence, contain a variety of security information, and serve as a valuable tool to assist management when taking actions to strengthen the information security environment.

[58] An issue tracking system (also ITS, trouble ticket system, ticketing management system, support ticket system, request management system, or incident ticket system) is a computer software package that manages and maintains lists of security issues.

Management should coordinate security operation activities with the institution's lines of business and with third-party service providers. Regardless of how extensive the coordination is, the goal should be to maintain a sufficient security operation capability across the entire environment.

Sufficient technology and staff should be available to support continual incident detection and response activities. Some institutions may rely on or supplement their activities with third parties to gain the necessary scope and depth of coverage. Refer to the *IT Handbook's* "Outsourcing Technology Services" booklet for more information.

III.A Threat Identification and Assessment

Action Summary

Management should do the following:

- Identify and assess threats.
- Use threat knowledge to drive risk assessment and response.
- Design policies to allow immediate and consequential threats to be dealt with expeditiously.

Threat identification and assessment involves discovering knowledge about threat sources and vulnerabilities and analyzing the potential for exploitation. This is much more focused than the risk identification process described in the "Risk Identification" section of this booklet. Information gained from threat identification and assessment should be used in risk assessment and response to drive protective and detective strategies and tactics. Strategies involve the information security program's policies, standards, and procedures, and the implementing technologies. Examples of tactics include threat signatures used for incident identification and management of threat behaviors. NIST notes that types of threat sources include the following:

- Hostile cyber or physical attacks.
- Human errors of omission or commission.
- Structural failures of organization-controlled resources (e.g., hardware, software, and environmental controls).
- Natural and man-made disasters, accidents, and failures beyond the control of the organization.[59]

Management should develop procedures for obtaining, monitoring, assessing, and responding to evolving threat and vulnerability information. The identification of threats involves the sources of threats, their capabilities, and their objectives. Information about threats generally comes from government (e.g., US-CERT), information-sharing organizations (e.g., FS-ISAC), industry sources, the institution, and third parties. Third-party information may be from organizations that specifically track and report on threats or from third-party reports of past activity. Some of those

[59] NIST SP 800-30, revision 1, "Information Security: Guide for Conducting Risk Assessments," September 2012.

reports compile knowledge from incidents reported by many organizations worldwide. Different types of information supporting an assessment may be available through the following:

- Incident data from reports published by security providers and others.
- Attack data from sources including FS-ISAC and managed security service providers.
- Threat data through reports available either free or for a fee.

The availability of threat information is often ad hoc, although some providers present threat information within a defined framework that readily lends itself to analytical operations. By using a threat taxonomy, the institution may greatly reduce the complexity of threat assessment and enable efficient understanding of reasonable risk mitigations. Specific factors in the threat assessment may include a description, context for operation, capabilities and intent, and, from the threat-source perspectives, benefits and negative consequences associated with an attack.

Knowledge of threat sources is especially important to help identify vulnerabilities. Vulnerabilities can occur in many areas, such as the system design, the system operation, security procedures, business line controls, and the implementation of the system and controls. Self-assessments, audits, scans, penetration tests, and reviews of SIEM reports can identify vulnerabilities. Additionally, external individuals or groups can identify vulnerabilities.

Tools for analyzing vulnerabilities in a layered security environment include attack trees, event trees, and kill chains. These tools attempt to model an attacker’s actions to enable identification of the most effective and efficient remediation options.

Once a threat is identified and potential vulnerabilities are assessed, the significance of the threat should trigger a response. The response should be commensurate with the risk posed by the threat and should include remediation options. Management should design policies to allow for immediate and consequential threats to be dealt with expeditiously, while less significant threats are addressed as part of a broader risk management process. When management receives vulnerability information from external individuals or groups, management should have appropriate processes and procedures to evaluate the credibility of the information to appropriately address it.

III.B Threat Monitoring

Threat monitoring policies should provide for continual and ad hoc monitoring of threat intelligence communications and systems, effective incident detection and response, and the use of monitoring reports in subsequent legal procedures. Management should establish the responsibility and authority of security personnel and system administrators for monitoring. Additionally, management should review and approve the tools used and the conditions for use.

Threat monitoring should address indicators of vulnerabilities, attacks, compromised systems, and suspicious users, such as those who do not comply with or seek to evade security policies. Monitoring should address incoming and outgoing network traffic, seeking to identify malicious activity and data exfiltration. Additionally, the monitoring process should be established and documented to independently monitor administrators and other users with higher privileges.

III.C Incident Identification and Assessment

Action Summary

Management should have a process to enable the following:

- Identify indicators of compromise.
- Analyze the event associated with the indicators.
- Classify the event.
- Escalate the event consistent with the classification.
- Report internally and externally as appropriate.

Incident identification involves indicators and analysis. External indicators may arise through contact with customers, law enforcement, card organizations (e.g., credit or payment cards), other financial institutions, media, or others. Internal indicators may arise when internal users contact the help desk, IT operations follows up on anomalies, or security operations follows up on anomalies identified through security devices and network and systems activity. Indicators may also arise through the use of “hunt teams,” or dedicated analysts who actively search for indicators of compromise. Examples of technology-based intrusion identification systems and tools include the following:

- Threat intelligence data feeds (e.g., STIX/TAXII).[60]
- Intrusion detection and prevention systems for networks and hosts.
- End-point visibility tools (tools that can identify the function of end points and which end points contain or have access to sensitive information).
- DLP tools.
- Log correlation and analysis tools.
- File integrity tools.
- Malware detection tools.
- Network behavior analysis systems.
- “Big data” tools and analytics that aggregate and allow pre-formed and ad hoc analysis.

Technology-based indicators of compromise generally are anomalies in host state, host activity, and network traffic. A few examples are unexpected (1) processes, (2) changes to files, (3) packet source or destination, (4) protocols, (5) ports, (6) encryption, (7) log-ins, and (8) packet content. Other indicators include alerts triggered by black lists in anti-virus and network-monitoring products.

Management should have a process for identifying indicators of compromise and rapidly reporting those indicators for investigation. The report should instigate an analysis that seeks to

[60] There are efforts to automate and structure operational cybersecurity information-sharing techniques across the globe. Of these, STIX (the Structured Threat Information eXpression) and TAXII (the Trusted Automated eXchange of Indicator Information) are two of the technical specifications that allow an automated exchange of threat source data using standardized language.

confirm whether a compromise took place and how that compromise should be classified. Investigation may require additional information from outside and inside the institution, such as a forensic review. Management should perform due diligence to identify external assistance in advance of incidents to ensure available resources. Classification of a compromise may require information on the specific hosts affected, data lost, and business processes affected. Information developed in the analysis may be useful to guide response activities.

Analysis should result in a classification of the event, implementation of escalation procedures, and reporting. Analysis should be guided by the following:

- Classification policies should be sufficiently clear to enable timely classification of incidents by level of severity, enabling the use of response teams and responses depending on the type and severity of events.
- Escalation, response, and reporting should be commensurate with the level of severity.
- Escalation policies should address when different personnel within the organization will be contacted and the responsibility those personnel have in incident analysis and response.
- Escalation policies should include when to request or obtain external assistance, from both third parties and the federal government.
- Reporting policies should address internal and external reporting, including coordination with third parties and reporting to external organizations (e.g., FS-ISAC).

Additionally, a policy should address who is empowered to declare an incident. A defined process should guide responses to incidents. The institution should develop procedures to test the incident escalation, response, and reporting processes.

The sharing of attack data through organizations, such as FS-ISAC, also has the potential to benefit the industry at large by enabling other institutions to better assess and respond to current attacks. Management should consider whether to include such information sharing as a part of its strategy to protect the institution.

Management should determine whether the institution’s or its managed security service provider’s analysts are sufficiently trained to appropriately analyze network, host, and application activity and to use the monitoring and analysis tools made available to them. Additionally, security analysts should coordinate and collaborate with others in the institution with knowledge and authority for specific types of malicious activity, such as fraud.

III.D Incident Response

Management should have an incident response program.[61] The goal of incident response is to minimize damage to the institution and its customers. The institution’s program should have defined protocols to declare and respond to an identified incident. More specifically, the incident response program should include, as appropriate, containing the incident, coordinating with law

[61] See also “Interagency Guidance on Response Programs for Unauthorized Access to Customer Information and Customer Notice,” supplementing the Information Security Standards.

enforcement and third parties, restoring systems, preserving data and evidence, providing assistance to customers, and otherwise facilitating operational resilience of the institution.

The response involves a combination of people and technologies. The quality of incident response is attributable to the institution's culture, policies, procedures, and training. Incident response is also a function of the relationships the institution formed before the incident with law enforcement, incident response consultants and attorneys, information-sharing entities (e.g., FS-ISAC), and others. Management should prepare for potential incidents by developing an incident response plan that is comprehensive, coordinated, and integrated with existing institution policies, procedures, and training. To validate the effectiveness of the institution's incident response program, management should periodically test it through different test types, including scenario planning and tabletop testing, and perform the tests with appropriate internal and external parties.

Preparation determines the success of any intrusion response. Such preparation involves defining the policies and procedures that guide the response; assigning responsibilities to individuals; providing appropriate training; formalizing information flows; and selecting, installing, and understanding the tools used in the response effort. Additionally, management should define thresholds for reporting significant security incidents, and consider developing processes for when the institution should notify its regulators of incidents that may affect the institution's operations, reputation, or sensitive customer information. These incidents may include those that could affect the financial system. Primary considerations for incident response include the following:

- How to balance concerns regarding confidentiality, integrity, and availability for devices and data. This consideration is a key driver for a containment strategy and may involve legal and liability considerations. Management may decide that some systems must be disconnected or shut down at the first sign of intrusion, while others must be left on line.
- When and under what circumstances to invoke the incident response activities, and how to ensure that the proper personnel are notified and available.
- When to involve outside experts and how to ensure the proper expertise will be available when needed. This consideration addresses both containment and restoration.
- Protocols to define when and under what circumstances to notify and involve regulators, customers, and law enforcement, including names and contact information for each group.
- Which personnel have authority to perform specific actions in the containment of the intrusion and restoration of the system. This consideration affects the internal communications strategy, the commitment of personnel, and procedures that escalate involvement and decisions within the organization.
- How, when, and what to communicate outside of the institution, whether to law enforcement, regulatory agencies, information-sharing organizations, customers, third-party service providers, potential victims, or others.
- How to document and maintain the evidence, the decisions made, and the actions taken.
- What criteria must be met before compromised services, equipment, and software are returned to the network.
- How to learn from the intrusion and use lessons learned to improve the institution's security.
- How and when to prepare and file a Suspicious Activities Report.

Successful implementation of any response policy or procedure requires the assignment of responsibilities, training, and testing. Some institutions formalize the response program with the creation of a security incident response team (SIRT). The SIRT typically is tasked with performing, coordinating, and supporting responses to security incidents and intrusions. Because of the wide range of technical and nontechnical issues posed by an intrusion, typical SIRT membership includes individuals with a wide range of backgrounds and expertise from different areas within the institution. Those areas include management, legal, and public relations, as well as IT staff. Other organizations may outsource some of the SIRT functions (e.g., forensic examinations). When SIRT functions are outsourced, management should require the third-party service provider to follow the institution’s policies and maintain the confidentiality of data.

Institutions should assess the adequacy of their preparation through testing. There are a variety of testing methods; therefore, management should consider the most applicable tests for its IT environment. Institutions can also participate with outside entities that provide testing activities (e.g., FS-ISAC).

While containment strategies between institutions can vary, they typically include the following broad elements:

- Isolation of compromised systems or enhanced monitoring of intruder activities.
- Search for additional compromised systems.
- Collection and preservation of evidence.
- Communication with affected parties and often the primary regulator, information-sharing organizations (e.g., FS-ISAC), or law enforcement.

Restoration and follow-up strategies should address the following:

- Elimination of an intruder’s means of access.
- Restoration of systems, programs, and data to a known good state.
- Initiation of customer notification and assistance activities consistent with laws, regulations, and interagency guidance.
- Monitoring to detect similar or further incidents.

Management should periodically review the actions taken in response to intrusions to identify improvements and implement those improvements through changes in policy, standards, procedures, training, and practices.

IV Information Security Program Effectiveness

The information security program should be subject to periodic review to ensure continual improvement in the program’s effectiveness. The review should address the program in the context of the environment in which the program now operates, both within the institution and outside. Lessons learned from experience, audit findings, and other indicators of opportunities for improvement should be identified and the program changed as appropriate.

IV.A Assurance and Testing

Action Summary

Management should ascertain that the information security program is operating securely, as expected, and reaching intended goals by doing the following:

- Testing and evaluating through self-assessments, tests, and audits with appropriate coverage, depth, and independence.
- Aligning personnel skills and program needs.
- Establishing and implementing a reporting process that includes the assembly and distribution of assurance reports that are timely, complete, transparent, and relevant to management decisions.

Assurance relates to the confidence that the information security program is mitigating risk as expected. Assurance targets two parts of the process: (1) the IT system's design and (2) the IT system's operation. The institution should carefully distinguish between the two because the former relates to risk decisions that change the security controls and the latter relates to the operation of the controls. Flaws in control design typically are corrected by a redesign, and flaws in operation typically are corrected through a compliance program.

The institution should have a documented testing and evaluation plan that addresses the integration of security controls, level of assurance desired, and strategies and activities performed in obtaining that assurance. The plan should identify specific components of the system to address, methods by which the components are to be addressed, timing and frequency of the tests and evaluations, and criteria used to ascertain whether the test and evaluation results are acceptable and provide assurance.[62]

IV.A.1 Key Testing Factors

Management should consider the following key factors when developing and implementing independent tests:

- **Scope.** The tests and methods utilized, in the aggregate, should be sufficient to validate the effectiveness of the security process in identifying and appropriately controlling the risk from information security-related events.
- **Personnel.** Technical testing is only as good as the personnel performing and supervising the test. Management should review qualifications of testing personnel to verify testers' capabilities are adequate to support the test objectives.
- **Notifications.** Management should consider whom to inform within the institution about the timing and nature of the tests. The need for protection of institution systems and the potential for disruptive false alarms should be balanced against the need to test personnel reactions to unexpected activities.

[62] See also Information Security Standards, section III.C.3, requiring each financial institution to test the key controls, systems, and procedures of its information security program using independent third parties or staff independent of those that develop or maintain the program.

- **Confidentiality, integrity, and availability.** Management should carefully control information security tests to limit the risks to confidentiality, integrity, and system availability. Because testing may uncover sensitive customer information, management should use appropriate safeguards to protect such information. Management should ensure that employee and contract personnel who perform the tests or have access to the test results have passed appropriate background checks and that contract personnel are appropriately bonded. Because certain tests may pose more risk to system availability than other tests, management should have personnel who perform those tests maintain logs of testing actions. Those logs are helpful if the systems react unexpectedly.
- **Confidentiality of test plans and data.** Because knowledge of test planning and results may facilitate a security breach, the institution should carefully limit the distribution of testing information. Management should restrict test plans and data only to those individuals involved in the testing. Results should be made available in a usable form only to those responsible for following up on tests. Additionally, management should require contractors to sign nondisclosure agreements and to return information they obtained in their testing to the institution.
- **Frequency.** The institution's ITRM process should determine the frequency of independent testing. Factors that may increase testing frequency include changes to network configurations, changes to or additions of systems and applications, significant changes in potential attacker profiles and techniques, and results of other testing. For instance, management should have a testing process for security and usability over the life cycle of testing (during development, before placing a new or modified system into production, and periodic testing of the production system or application).
- **Proxy testing.** Proxy testing refers to testing that is conducted on like systems and with like interfaces, rather than the actual system, to avoid disruptions on a system that may be too critical for a comprehensive continuity test. Proxy tests are conducted using the same hardware and operating software, are sometimes used as a replacement for actual tests, and should provide similar results. Independent testing of a proxy system is generally not effective in validating the effectiveness of a security process. Proxy testing, by its nature, does not test the operational system's policies and procedures or its integration with other systems. It also does not test the reaction of personnel to unusual events. Proxy testing may be the best choice, however, when management is unable to test the operational system without creating excessive risk.

IV.A.2 Types of Tests and Evaluations

Information security management may use several tools to gain confidence that the information security program is operating as expected and reaching the intended goals. The primary tools include self-assessments, penetration tests, vulnerability assessments, and audits. The coverage and depth of the various tools directly relates to the confidence gained in the information security program.

IV.A.2(a) *Self-Assessments*

Periodic self-assessments typically should be performed by the organizational unit being assessed. Self-assessments capture subjective opinions on the achievement of objectives.

Although they may provide valuable information related to perceived changes in the level of risk and effectiveness of controls, they are affected by the breadth and depth of the assessor's knowledge, the completeness and reliability of information used to complete the assessment, and the assessor's biases. Self-assessment frequency should be a function of the level of assurance needed by the institution, determined by the risk management process. Results from self-assessments can be informative to the overall test and evaluation process. Management should use the results to help strengthen the organizational unit's information security.

IV.A.2(b) *Penetration Tests*

A penetration test subjects a system to real-world attacks selected and conducted by the testers. A penetration test targets systems and users to identify weaknesses in business processes and technical controls. The test mimics a threat source's search for and exploitation of vulnerabilities to demonstrate a potential for loss. Some tests focus on only a subset of the institution's systems and may not accurately simulate a determined threat actor. There are many types of penetration tests (e.g., network, client-side, web application, and social engineering), and management should determine the level and types of tests employed to ensure effective and comprehensive coverage.

The frequency and scope of a penetration test should be a function of the level of assurance needed by the institution and determined by the risk assessment process. The test can be performed internally by independent groups, internally by the organizational unit, or by an independent third party. Management should determine the level of independence required of the test.

IV.A.2(c) *Vulnerability Assessments*

A vulnerability assessment is a process that defines, identifies, and classifies the vulnerabilities in a computer, network, or communications infrastructure. Technical vulnerabilities can be identified through the use of scanners and other tools. Scanners search for known vulnerabilities (e.g., Mitre's CVE) or for known vulnerability classes (e.g., Structured Query Language [SQL] injection and cross-site scripting). They also can search for compliance with approved configurations. Scanners identify vulnerabilities by inspecting network traffic or hosts. When inspecting hosts, they may require agents to be placed on the hosts with high-level access. If host agents are required, the security over the use of credentials in the scan should be a prime consideration for management.

Similar to penetration testing, the frequency of the performance of vulnerability assessments should be determined by the risk management process. Scanners and other tools can be run continuously, generating metrics that are reported and acted upon continuously. Alternatively, they can be run periodically. Vulnerability assessments can be performed internally or by external testers, but they are often run as part of internal testing processes.

IV.A.2(d) *Audits*

Independent internal departments or third parties typically perform audits. Audits should review every aspect of the information security program, the environment in which the program runs, and outputs of the program. Audits should assess the reasonableness and appropriateness of, and compliance with, policies, standards, and procedures; report on information security activity and control deficiencies to decision makers; identify root causes and recommendations to address deficiencies; and test the effectiveness of controls within the program. Internal audit should track the results and the remediation of control deficiencies reported in audits and additional technical reviews, such as penetration tests and vulnerability assessments.

Refer to the *IT Handbook's* "Audit" booklet for more information.

IV.A.3 Independence of Tests and Audits

Institutions frequently use independent organizations to test aspects of their information security programs. Independent tests have the potential to reduce bias, increase capabilities, and increase knowledge about threats and technologies. Independence gives credibility to the test results. To be considered independent, testing personnel should not be responsible for the design, installation, maintenance, and operation of the tested system, or the policies and procedures that guide its operation. The reports generated from the tests should be prepared by individuals who similarly are independent.

IV.A.4 Assurance Reporting

Reporting of self-assessments, penetration tests, vulnerability assessments, and audits supports management decision making. Those decisions may support a range of ITRM activities, including the prioritization and funding of resource allocations and improvement to existing information security policies and procedures.

Management should provide reports that are timely, complete, transparent, and relevant to management decisions. The reports should prioritize risk and findings in the order of importance, suggest options for remediation, and highlight repeat issues. Additionally, reports should address root causes. The reporting should be to individuals with authority and responsibility to act on the reports and to those accountable for the outcomes, as well as those responsible for advising or influencing risk decisions. Reporting should trigger appropriate, timely, and reliable escalation and response procedures. Summary reports should be made available to the board as appropriate.

Appendix A: Examination Procedures

Examination Objective

Determine the quality and effectiveness of the institution's information security. Examiners should use these procedures to measure the adequacy of the institution's culture, governance, information security program, security operations, and assurance processes. In addition, controls should be evaluated as additional evidence of program quality and effectiveness. Controls also should be evaluated for conformance with contracts, indicators of legal liability, and conformance with regulatory policy and guidance. Failure of management to implement appropriate controls may expose the institution to potential loss from fines, penalties, and customer litigation.

These examination procedures (commonly referred to as the work program) are intended to help examiners determine the effectiveness of the institution's information security process. Examiners may choose, however, to use only particular components of the work program based on the size, complexity, and nature of the institution's business. Examiners should also use these procedures to measure the adequacy of the institution's cybersecurity risk management processes.

Objective 1: Determine the appropriate scope and objectives for the examination.

1. Review past reports for outstanding issues or previous problems. Consider the following:

    a. Regulatory reports of examination.
    b. Internal and external audit reports.
    c. Independent security tests.
    d. Regulatory, audit, and security reports on service providers.

2. Review management's response to issues raised at, or since, the last examination. Consider the following:

    a. Adequacy and timing of corrective action.
    b. Resolution of root causes rather than just specific issues.
    c. Existence of any outstanding issues.

3. Interview management and review responses to pre-examination information requests to identify changes to technology infrastructure or new products and services that might increase the institution's risk. Consider the following:

    a. Products or services delivered to either internal or external users.
    b. Network topology or diagram including changes to configuration or components and all internal and external connections.
    c. Hardware and software inventories.
    d. Loss, addition, or change in duties of key personnel.
    e. Technology service providers and software vendor listings.

f. Communication lines with other business units (e.g., loan review, credit risk management, line of business quality assurance, and internal audit).
g. Credit or operating losses primarily attributable (or thought to be attributable) to IT (e.g., system problems, fraud occurring due to poor controls, and improperly implemented changes to systems).
h. Changes to internal business processes.
i. Internal reorganizations.

4. Determine the complexity of the institution's information security environment.

   a. Determine the degree of reliance on service providers for information processing and technology support, including security operation management.
   b. Identify unique products and services and any required third-party access requirements.
   c. Determine the extent of network connectivity internally and externally and the boundaries and functions of security domains.
   d. Identify the systems that have recently undergone significant change, such as new hardware, software, configuration, and connectivity. Correlate the changed systems with the business processes they support, the extent of customer data available to those processes, and the effect of those changes on institution operations.

Objective 2: Determine whether management promotes effective governance of the information security program through a strong information security culture, defined information security responsibilities and accountability, and adequate resources to support the program.

1. Determine whether the institution has a culture that contributes to the effectiveness of the information security program.

   a. Determine whether the institution's board and management understand and support information security and provide appropriate resources for the implementation of an effective security program.
   b. Determine whether the information security program is integrated with the institution's lines of business, support functions, and management of third parties.
   c. Review for indicators of an effective information security culture (e.g., method of introducing new business initiatives and manner in which the institution holds lines of business and employees accountable for promoting information security).

2. Determine whether the board, or a committee of the board, is responsible for overseeing the development, implementation, and maintenance of the institution's information security program.

3. Determine whether the board holds management accountable for the following:

   a. Central oversight and coordination.
   b. Assignment of responsibility.
   c. Support of the information security program.

d. Effectiveness of the information security program.

4. Determine whether the board approves a written information security program and receives a report on the effectiveness of the information security program at least annually. Determine whether the report to the board describes the overall status of the information security program and discusses material matters related to the program such as the following:

   a. Risk assessment process, including threat identification and assessment.
   b. Risk management and control decisions.
   c. Service provider arrangements.
   d. Results of security operations activities and summaries of assurance reports.
   e. Security breaches or violations and management's responses.
   f. Recommendations for changes or updates to the information security program.

5. Determine whether management responsibilities are appropriate and include the following:

   a. Implementation of the information security program by clearly communicating responsibilities and holding appropriate individuals accountable for carrying out these responsibilities.
   b. Establishment of appropriate policies, standards, and procedures to support the information security program.
   c. Participation in assessing the effect of security threats or incidents on the institution and its business lines and processes.
   d. Delineation of clear lines of responsibility and communication of accountability for information security.
   e. Adherence to risk thresholds established by the board relating to information security threats or incidents, including those relating to cybersecurity.
   f. Oversight of risk mitigation activities that support the information security program.
   g. Establishment of appropriate segregation of duties.
   h. Coordination of both information and physical security.
   i. Integration of security controls throughout the institution.
   j. Protection of data consistently throughout the institution.
   k. Definition of the information security responsibilities of third parties.
   l. Facilitation of annual information security and awareness training and ongoing security-related communications to employees.

6. Determine whether management has designated one or more individuals as an information security officer and determine appropriateness of the reporting line.

7. Determine whether security officers and employees know, understand, and are accountable for fulfilling their security responsibilities.

8. Determine the adequacy of audit coverage and reporting of the information security program by reviewing appropriate audit reports and board or audit committee minutes. (For further questions, refer to the *IT Handbook's* "Audit" booklet examination procedures.)[63]

9. Determine whether the board provides adequate funding to develop and implement a successful information security function. Review whether the institution has the following:

   a. Appropriate staff with the necessary skills to meet the institution's technical and managerial needs.
   b. Personnel with knowledge of technology standards, practices, and risk methodologies.
   c. Training to prepare staff for their short- and long-term security responsibilities.
   d. Oversight of third parties when they supplement an institution's technical and managerial capabilities.

10. Determine whether management has adequately incorporated information security into its overall ITRM process. (For further questions, refer to the *IT Handbook's* "Management" booklet examination procedures.)[64]

Objective 3: Determine whether management of the information security program is appropriate and supports the institution's ITRM process, integrates with lines of business and support functions, and integrates third-party service provider activities with the information security program.

1. Determine whether the institution has an effective information security program that supports the ITRM process. Review whether the program includes the following:

   a. Identification of threats and risks.
   b. Measurement of risks.
   c. Implementation of risk mitigation.
   d. Monitoring and reporting of risks.
   e. Methods to assess the program's effectiveness.

2. Determine whether management appropriately integrates the information security program across the institution's lines of business and support functions. Review whether management has the following:

   a. Security policies, standards, and procedures that are designed to support and to align with the policies in the lines of business.
   b. Incident response programs that include all affected lines of business and support units.
   c. Common awareness and enforcement mechanisms between lines of business and information security.
   d. Visibility to assess the likelihood of threats and potential damage to the institution.
   e. The ability to identify and implement controls over the root causes of an incident.

[63] See the *IT Handbook's* "Audit" booklet examination procedures.

[64] See the *IT Handbook's* "Management" booklet examination procedures.

3. If the institution outsources activities to a third-party service provider, determine whether management integrates those activities with the information security program. Verify that the third-party management program evidences expectations that align with the institution's information security program.

Objective 4: As part of the information security program, determine whether management has established risk identification processes.

1. Determine whether management effectively identifies threats and vulnerabilities continuously.

2. Determine whether the risk identification process produces manageable groupings of information security threats, including cybersecurity threats. Review whether management has the following:

   a. A threat assessment to help focus the risk identification efforts.
   b. A method or taxonomy for categorizing threats, sources, and vulnerabilities.
   c. A process to determine the institution's information security risk profile.
   d. A validation of the risk identification process through audits, self-assessments, penetration tests, and vulnerability assessments.
   e. A validation though audits, self-assessments, penetration tests, and vulnerability assessments that risk decisions are informed by appropriate identification and analysis of threats and other potential causes of loss.

3. Determine whether management has a means to collect data on potential threats to identify information security risks. Determine whether management uses threat modeling (e.g., development of attack trees) to assist in identifying and quantifying risk and in better understanding the nature, frequency, and sophistication of threats.

4. Determine whether management has continuous, established routines to identify and assess vulnerabilities. Determine whether management has processes to receive vulnerability information disclosed by external individuals or groups, such as security or vulnerability researchers.

5. Determine whether management adjusts the information security program for institutional changes and changes in legislation, regulation, regulatory policy, guidance, and industry practices. Review whether management has processes to do the following:

   a. Maintain awareness of new legal and regulatory requirements or changes to industry practices.
   b. Update the information security program to reflect changes.
   c. Report changes of the information security program to the board.

Objective 5: Determine whether management measures the risk to guide its recommendations for and use of mitigating controls.

1. Determine whether management uses tools to perform threat analysis and analyzes information security events to help do the following:

    a. Map threats and vulnerabilities.
    b. Incorporate legal and regulatory requirements.
    c. Improve consistency in risk measurement.
    d. Highlight potential areas for mitigation.
    e. Allow comparisons among different threats, events, and potential mitigating controls.

Objective 6: Determine whether management effectively implements controls to mitigate identified risk.

1. Determine whether policies, standards, and procedures are of sufficient scope and depth to guide information security-related decisions. Review whether policies, standards, and procedures have the following characteristics:

    a. Are appropriately implemented and enforced.
    b. Delineate areas of responsibility.
    c. Are communicated in a clear and understandable manner.
    d. Are reviewed and agreed to by employees.
    e. Are appropriately flexible to address changes in the environment.

2. Determine whether the information security policy is annually reviewed and approved by the board.

3. Determine whether the institution continually assesses the capability of technology needed to sustain an appropriate level of information security based on the size, complexity, and risk appetite of the institution.

4. Determine whether management implements an integrated control system characterized by the use of different control types that mitigates identified risks. Review whether management does the following:

    a. Implements a layered control system using different controls at different points in a transaction process.
    b. Uses controls of different classifications, including preventive, detective, and corrective.
    c. Verifies that compensating controls are used appropriately to compensate for weaknesses with the system or process.

5. Determine whether management implements controls that appropriately align security with the nature of the institution's operations and strategic direction. Specifically, review whether management does the following:

a. Implements controls based on the institution’s risk assessment to mitigate risk from information security threats and vulnerabilities, such as interconnectivity risk.
b. Evaluates whether the institution has the necessary resources, personnel training, and testing to maximize the effectiveness of the controls.
c. Reviews and improves or updates the security controls, where necessary.

6. Determine whether management effectively maintains an inventory(ies) of hardware, software, information, and connections. Review whether management does the following:

   a. Identifies assets that require protection, such as those that store, transmit, or process sensitive customer information, or trade secrets.
   b. Classifies assets appropriately.
   c. Uses the classification to determine the sensitivity and criticality of assets.
   d. Uses the classification to implement controls required to safeguard the institution’s assets.
   e. Updates the inventory(ies) appropriately.

7. Determine whether management comprehensively and effectively identifies, measures, mitigates, monitors, and reports interconnectivity risk. Review whether management does the following:

   a. Identifies connections with third parties.
   b. Identifies access points and connection types that pose risk.
   c. Identifies connections between and access across low-risk and high-risk systems.
   d. Measures the risk associated with connections with third parties with remote access.
   e. Implements and assesses the adequacy of appropriate controls to ensure the security of connections.
   f. Monitors and reports on the institution’s interconnectivity risk.

8. Determine whether management effectively mitigates risks posed by users. Review whether management does the following:

   a. Develops and maintains a culture that fosters responsible and controlled access for users.
   b. Establishes and effectively administers appropriate security screening in IT hiring practices.
   c. Establishes and appropriately administers a user access program for physical and logical access.
   d. Employs appropriate segregation of duties.
   e. Obtains agreements from employees, contractors, and service providers covering confidentiality, nondisclosure, and authorized use.
   f. Provides training to support awareness and policy compliance.

9. Determine whether management applies appropriate physical security controls to protect its premises and more sensitive areas, such as its data center(s).

10. Determine whether management secures access to its computer networks through multiple layers of access controls. Review whether management does the following:

    a. Establishes zones (e.g., trusted and untrusted) according to risk with appropriate access requirements within and between each zone.
    b. Maintains accurate network diagrams and data flow charts.
    c. Implements appropriate controls over wired and wireless networks.

11. Determine whether management has a process to introduce changes to the environment (e.g., configuration management of IT systems and applications, hardening of systems and applications, use of standard builds, and patch management) in a controlled manner. Determine whether management does the following:

    a. Maintains procedures to guide the process of introducing changes to the environment.
    b. Defines change requirements.
    c. Restricts changes to authorized users.
    d. Reviews the potential impact changes have on security controls.
    e. Identifies all system components affected by the changes.
    f. Develops test scripts and implementation plans.
    g. Performs necessary tests of all changes to the environment (e.g., systems testing, integration testing, functional testing, user acceptance testing, and security testing).
    h. Defines rollback procedures in the event of unintended or negative consequences with the introduced changes.
    i. Verifies the application or system owner has authorized changes in advance.
    j. Maintains strict version control of all software updates.
    k. Validates that new hardware complies with institution policies and guidelines.
    l. Verifies network devices are properly configured and function appropriately within the environment
    m. Maintains an audit trail of all changes.

12. Determine whether appropriate processes exist for configuration management (managing and controlling configurations of systems, applications, and other technology).

13. Determine whether management has processes to harden applications and systems (e.g., installing minimum services, installing necessary patches, configuring appropriate security settings, enforcing principle of least privilege, changing default passwords, and enabling logging).

14. Determine whether management uses standard builds, allowing one documented configuration to be applied to multiple computers in a controlled manner, to create hardware and software inventories, update or patch systems, restore systems, investigate anomalies, and audit configurations.

15. Determine whether management has a process to update and patch operating systems, network devices, and software applications, including internally developed software provided

to customers, for newly discovered vulnerabilities. Review whether patch management processes include the following:

a. An effective monitoring process that identifies the availability of software patches.
b. A process to evaluate the patches against the threat and network environment.
c. A prioritization process to determine which patches to apply across classes of computers and applications.
d. A process for obtaining, testing, and securely installing the patches.
e. An exception process, with appropriate documentation, for patches that an institution decides to delay or not apply.
f. A process to ensure that all patches installed in the production environment are also installed in the disaster recovery environment.
g. A documentation process to ensure the institution's information assets and technology inventory and disaster recovery plans are updated as appropriate when patches are applied.
h. Actions to ensure that patches do not compromise the security of the institution's systems.

16. Determine whether management plans for the life cycles of the institution's systems, eventual end of life, and any corresponding business impacts. Review whether the institution's life cycle management includes the following:

a. Maintaining inventories of systems and applications.
b. Adhering to an approved end-of-life or sunset policy for older systems.
c. Tracking changes made to the systems and applications, availability of updates, and the planned end of support by the vendor.
d. Planning for the update or replacement of systems nearing obsolescence.
e. Outlining procedures for the secure destruction or wiping of hard drives being returned to vendors or donated to prevent the inadvertent disclosure of sensitive information.

17. Determine whether management has implemented defense-in-depth to protect, detect, and respond to malware.

18. Determine whether management maintains policies and effectively controls and protects access to and transmission of information to avoid loss or damage. Review whether management does the following:

a. Requires secure storage of all types of sensitive information, whether on computer systems, portable devices, physical media, or hard-copy documents.
b. Establishes controls to limit access to data.
c. Requires appropriate controls over data stored in a cloud environment.
d. Implements appropriate controls over the electronic transmission of information or, if appropriate safeguards are unavailable, restricts the type of information that can be transmitted.
e. Has appropriate disposal procedures for both paper-based and electronic information.

f. Maintains the security of physical media, including backup tapes, containing sensitive information while in transit, including to off-site storage, or when shared with third parties.
g. Has policies restricting the use of unsanctioned or unapproved IT resources (e.g., online storage services, unapproved mobile device applications, and unapproved devices).

19. Determine whether management identifies factors that may increase risk from supply chain attacks and responds with appropriate risk mitigation. Review whether management implements the following as appropriate:

    a. Purchases are made only through reputable sellers.
    b. Purchases are made through a third party to shield the institution's identity.
    c. Hardware is reviewed for anomalies.
    d. Software is reviewed through both automated software testing and code reviews.
    e. Reliability of the items purchased is regularly reviewed post-implementation.

20. Determine whether management has an effective process to administer logical security access rights for the network, operating systems, applications, databases, and network devices. Review whether management has the following:

    a. An enrollment process to add new users to the system.
    b. An authorization process to add, delete, or modify authorized user access to operating systems, applications, directories, files, and specific types of information.
    c. A monitoring process to oversee and manage the access rights granted to each user on the system.
    d. A process to control privileged access.
    e. A process to change or disable default user accounts and passwords.

21. As part of management's process to secure the operating system and all system components, determine whether management does the following:

    a. Limits the number of employees with access to operating system and system utilities and grants only the minimum level of access required to perform job responsibilities.
    b. Restricts and logs access to and activity on operating system parameters, system utilities (especially those with data-altering capabilities), and sensitive system resources (including files, programs, and processes), and supplements with additional security software, as necessary.
    c. Restricts operating system access to specific terminals in physically secure and monitored locations.
    d. Secures or removes external drives and portable media from system consoles, terminals, or PCs running terminal emulations, residing outside of physically secure locations.
    e. Prohibits remote access to operating system and system utilities, where feasible, and, at a minimum, requires strong authentication and encrypted sessions before allowing such remote access.
    f. Filters and reviews logs for potential security events and provides adequate reports and alerts.

g. Independently monitors operating system access by user, terminal, date, and time of access.

22. Determine whether management controls access to applications. Review whether management does the following:

    a. Implements a robust authentication method consistent with the criticality and sensitivity of the application.
    b. Manages application access rights by using group profiles.
    c. Periodically reviews and approves the application access assigned to users for appropriateness.
    d. Communicates and enforces the responsibilities of programmers, security administrators, and application owners in maintaining effective application access control.
    e. Sets time-of-day or terminal limitations for some applications or for more sensitive functions within an application.
    f. Logs access and events, defines alerts for significant events, and develops processes to monitor and respond to anomalies and alerts.

23. Determine whether management has policies and procedures to ensure that remote access by employees, whether using institution or personally owned devices, is provided in a safe and sound manner. Review whether management does the following:

    a. Provides remote access in a safe and sound manner.
    b. Implements the controls necessary to offer remote access securely (e.g., disables unnecessary remote access, obtains approvals for and performs audits of remote access, maintains robust configurations, enables logging and monitoring, secures devices, restricts remote access during specific times, controls applications, enables strong authentication, and uses encryption).

24. Determine whether management effectively controls employees' use of remote devices. Review whether management does the following:

    a. Implements controls over institution owned and personally owned devices used by employees to access the network (e.g., disallows remote access without business justification, requires management approval, reviews remote access approvals, restricts access to authorized network areas, logs remote access, implements robust authentication, uses encryption, and uses application white-listing).
    b. Implements controls over remote devices provided by the institution (e.g., securely configures remote access devices, protects devices against malware, patches and updates software, encrypts sensitive data, implements secure containers, audits device access, uses remote disable and wipe capabilities, and uses geolocation).
    c. Uses an effective method to ensure personally owned devices meet defined institution security standards (e.g., such as operating system version, patch levels, and anti-malware solutions).

25. Determine whether management effectively provides secure customer access to financial services and plans for potential interruptions in service. Review whether management does the following:

    a. Develops and maintains policies and procedures to securely offer and ensure the resilience of remote financial services (e.g., using appropriate authentication, layered security controls, and fraud detection monitoring). (For additional questions, refer to the "Mobile Financial Services" examination procedures.)[65]
    b. Plans and coordinates with ISPs and third parties to minimize exposure to incidents and continue services when faced with an incident (e.g., monitors threat alerts, service availability, applications, and network traffic for indicators of nefarious activity, and ensures traffic filtering).
    c. Develops and tests a response plan in conjunction with the institution's ISPs and third-party service providers to mitigate the interruption of mobile or remote financial services.

26. Determine whether management develops customer awareness and education efforts that address both retail (consumer) and commercial account holders.

27. Determine whether management uses applications that were developed by following secure development practices and that meet a prudent level of security. Determine whether management develops security control requirements for applications, whether they are developed in-house or externally. Determine whether information security personnel are involved in monitoring the application development process to verify secure development practices. Review whether applications in use provide the following capabilities:

    a. Provide a prudent level of security (e.g., password and audit policies), audit trails of security and access changes, and user activity logs.
    b. Have user and group profiles to manage user access for applications if they are not part of a centralized identity access management system.
    c. Provide the ability to change and disable default application accounts upon installation.
    d. Allow administrators to review and install patches for applications in a timely manner.
    e. Use validation controls for data entry and data processing.
    f. Integrate additional authentication and encryption controls, as necessary.
    g. Protect web or Internet-facing applications through additional controls, including web application firewalls, regular scanning for new or recurring vulnerabilities, mitigation or remediation of common security weaknesses, and network segregation.

28. With respect to developed software, determine whether institution management does the following:

    a. Reviews mitigation of potential flaws in applications.
    b. Obtains attestation or evidence from third-party developers that the applications acquired by the institution meet the necessary security requirements and that noted vulnerabilities or flaws are remediated in a timely manner.

[65] Refer to appendix E of the *IT Handbook's* "Retail Payment Systems" booklet.

c. Performs ongoing risk assessments to consider the adequacy of application-level controls in light of changing threat, network, and host environments.
d. Implements minimum controls recommended by third-party service providers and considers supplemental controls as appropriate.
e. Reviews available audit reports, and considers and implements appropriate control recommendations.
f. Collects data to build metrics and reporting of configuration management compliance, and vulnerability management.

29. For database security, determine whether management implemented or enabled controls commensurate with the sensitivity of the data stored in or accessed by the database(s). Determine whether management appropriately restricts access and applies the rule of least privilege in assigning authorizations.

30. Determine how and where management uses encryption and if the type and strength are sufficient to protect information appropriately. Additionally, determine whether management has effective controls over encryption key management.

31. Determine whether management appropriately oversees the effectiveness of information security controls over outsourced operations and is accountable for the mitigation of risks involved with the use of third-party service providers. Review the due diligence involved, security controls to mitigate risk, and monitoring capabilities over the institution's third parties. Review the institution's policies, standards, and procedures related to the use of the following:

    a. Third-party service providers that facilitate operational activities (e.g., core processing, mobile financial services, cloud storage and computing, and managed security services).
    b. Due diligence in research and selection of third-party service providers.
    c. Contractual assurances from third-party service providers for security responsibilities, controls, and reporting.
    d. Nondisclosure agreements with third-party service providers with access to the institution's systems and data (including before, during, and following termination of the contract).
    e. Independent review of the third-party service provider's security through appropriate reports from audits and tests.
    f. Coordination of incident response policies and contractual notification requirements.
    g. Verification that information and cybersecurity risks are appropriately identified, measured, mitigated, monitored, and reported.

32. If the institution outsources cloud computing or storage to a third-party service provider, refer to the FFIEC's "Outsourced Cloud Computing" statement.[66]

[66] See the FFIEC's "Outsourced Cloud Computing" statement.

33. If the institution outsources the management of security services to a third-party service provider, refer to the information available in appendix D of the *IT Handbook's* "Outsourcing Technology Services" booklet and the related examination procedures.[67]

34. Determine whether management effectively manages the following information security considerations related to business continuity planning. Review management's ability to do the following:

    a. Identify personnel with key information security roles during a disaster and training of personnel in those roles.
    b. Define information security needs for backup sites and alternate communication networks.
    c. Develop policies that address the concepts of information security incident response and resilience and test information security incident scenarios.

35. Determine whether management has an effective log management process that involves a central logging repository, timely transmission of log files, and effective log analysis. Review whether management has the following:

    a. Log retention policies that meet incident response and analysis needs.
    b. Processes for the security and integrity of log files (e.g., encryption of log files, adequate storage capacity, secure backup and disposal of logs, logging to a separate computer, use of read-only media, controlled log parameters, and restricted access to log files).
    c. Independent review of logging practices.
    d. Processes to effectively collect, aggregate, analyze, and correlate security event information from discrete systems and applications.

Objective 7: Determine whether management has effective risk monitoring and reporting processes.

1. Determine whether the institution has risk monitoring and reporting processes that address changing threat conditions in both the institution and the greater financial industry. Determine whether these processes address information security events faced by the institution, the effectiveness of management's response, and the institution's resilience to those events. Review whether the reporting process includes a method of disseminating those reports to appropriate members of management.

2. Determine whether the risk monitoring and reporting process is regular and prompts action, when necessary, in a timely manner.

3. Determine whether program monitoring and reporting instigate appropriate changes that are effective in maintaining an acceptable level of risk.

[67] Refer to the *IT Handbook's* "Outsourcing Technology Services" booklet for the MSSP Examination Procedures.

4. Determine whether management develops and effectively uses metrics as part of the risk monitoring and reporting processes for the information security program. Review whether management does the following:

    a. Uses metrics that are timely, comprehensive, and actionable to improve the program's effectiveness and efficiency.
    b. Develops metrics that demonstrate the extent to which the information security program is implemented and whether the program is effective.
    c. Uses metrics to measure security policy implementation, the adequacy of security services delivery, and the impact of security events on business processes.
    d. Establishes metrics to measure conformance to the standards and procedures that are used to implement policies.
    e. Uses metrics to quantify and report risks in the information security program.

Objective 8: Determine whether management has security operations that encompass necessary security-related functions, are guided by defined processes, are integrated with lines of business and activities outsourced to third-party service providers, and have adequate resources (e.g., staff and technology).

1. Determine whether the institution's security operations activities include the following:

    a. Security software and device management (e.g., maintaining the signatures on signature-based devices and firewall rules).
    b. Forensics (e.g., analysis of potentially compromised systems).
    c. Vulnerability identification (e.g., operation or supervision of vulnerability scans, self-assessments, penetration tests, and analysis of audit results).
    d. Vulnerability cataloging and remediation tracking.
    e. Physical security management (e.g., CCTV, guards, and badge systems).
    f. Law enforcement interface (e.g., data retention and lawful intercepts).
    g. Third-party integration (e.g., managed security services and incident detection services).
    h. Monitoring of network, host, and application activity.
    i. Threat identification and assessment.
    j. Incident detection and management.
    k. Enforcement of access controls.

2. Determine whether management establishes defined processes and appropriate governance to facilitate the performance of security operations. Determine whether management coordinates security operations activities with the institution's lines of business and with the institution's third-party service providers.

3. Determine whether management has effective threat identification and assessment processes, including the following:

    a. Maintaining procedures for obtaining, monitoring, assessing, and responding to evolving threat and vulnerability information.

b. Identifying and assessing threats (e.g., threat information is often ad hoc, although some providers present threat information within a defined framework that readily lends itself to analytical operations).
c. Using tools to assist in the analysis of vulnerabilities (e.g., design of system, operation of the system, security procedures, business line controls, and implementation of the system and controls).
d. Using threat knowledge to drive risk assessment and response.
e. Designing policies to allow immediate and consequential threats to be dealt with expeditiously.
f. Developing appropriate processes to evaluate and respond to vulnerability information from external groups or individuals.

4. Determine whether management has effective threat monitoring processes, including the following:

   a. Defining threat monitoring policies that provide for both continual and ad hoc monitoring of communications and systems, effective incident detection and response, and the use of monitoring reports in subsequent legal proceedings.
   b. Establishing responsibility and accountability for security personnel and system administrators for monitoring.
   c. Appropriately reviewing and providing approval of the monitoring tools used.
   d. Monitoring of indicators, including vulnerabilities, attacks, compromised systems, and suspicious users.
   e. Monitoring both incoming and outgoing network traffic to identify malicious activity and data exfiltration.
   f. Establishing and documenting a process to independently monitor administrators and other users with higher privileges.

5. Determine whether management has effective incident identification and assessment processes to do the following:

   a. Identify indicators of compromise.
   b. Analyze the event associated with the indicators.
   c. Classify the event.
   d. Enable the use of response teams and responses depending on the type of event.
   e. Escalate the event consistent with the classification.
   f. Report internally and externally as appropriate.
   g. Identify personnel empowered to declare an incident.
   h. Develop procedures to test the incident escalation, response, and reporting processes.

6. Determine whether management has effective incident response processes, including the following:

   a. Protocols defined in the incident response policy to declare and respond to an incident once identified.

b. Procedures to minimize damage through the containment of the incident, restoration of systems, preservation of data and evidence, and notification, as appropriate, to customers and others as needed.
c. Appropriate balance of adequate people and technologies in the response.
d. A plan that is comprehensive, coordinated, integrated, and periodically tested with appropriate internal and external parties.
e. Policies and procedures to guide the response, assigning responsibilities to individuals; providing appropriate training; formalizing information flows; and selecting, installing, and understanding the tools used in the response effort.
f. Thresholds for reporting significant security incidents and processes to notify, as appropriate, the institution's regulators of those incidents that may affect the institution or the financial system.
g. Assignment of responsibilities, training, and testing.
h. Containment strategies.
i. Restoration and follow-up strategies.

Objective 9: Determine whether management has an effective information security program.

1. Determine whether the information security program is subject to periodic review and whether management provides for continual improvement in the program's effectiveness. Verify whether that review does the following:

    a. Addresses the program in its current environment.
    b. Demonstrates that lessons learned from experience, audit findings, and other opportunities for improvement are identified and applied.

Objective 10: Determine whether assurance activities provide sufficient confidence that the security program is operating as expected and reaching intended goals.

1. Review whether management ascertains assurance through the following:

    a. Testing and evaluations through a combination of self-assessments, penetration tests, vulnerability assessments, and audits with appropriate coverage, depth, and independence.
    b. Alignment of personnel skills and program needs.
    c. Reporting that is timely, complete, transparent, and relevant to management decisions.

2. Determine whether management considers the following key testing factors when developing and implementing independent tests:

    a. Scope.
    b. Personnel.
    c. Notifications.
    d. Confidentiality, integrity, and availability of the institution's information.
    e. Confidentiality of test plans and data.
    f. Frequency.

    g. Proxy testing.

3. Determine whether management uses the following types of tests and evaluations to determine the effectiveness of the information security program. Verify whether management ensures the following are done:

    a. Periodic self-assessments performed by the organizational unit being assessed.
    b. Penetration tests that subject a system to real-world attacks and identify weaknesses.
    c. Vulnerability assessments that define, identify, and classify the security holes found in the system.
    d. Audits performed by independent internal departments or third parties.

4. Determine whether management uses independent organizations to test aspects of its information security programs.

5. Determine whether management uses reporting of the results of self-assessments, penetration tests, vulnerability assessments, and audits to support management decision making.

6. Determine whether the annual information security report is timely and contains adequate information.

Objective 11: Discuss corrective action and communicate findings.

1. Review preliminary conclusions with the examiner-in-charge regarding the following:

    a. Violations of laws or regulations.
    b. Significant issues warranting inclusion as matters requiring attention or recommendations in the report of examination.
    c. The proposed Uniform Rating System for Information Technology management component rating and the potential impact of the conclusion on the composite or other component IT ratings.
    d. Potential impact of conclusions on the institution’s risk assessment.

2. Discuss findings with management and obtain proposed corrective action for significant deficiencies.

3. Document conclusions in a memo to the examiner-in-charge that provides report-ready comments for all relevant sections of the report of examination and guidance to future examiners.

4. Organize work papers to ensure clear support for significant findings by examination objective.

Appendix B: Glossary

Acceptable use policy: A document that establishes an agreement between users and the enterprise and defines for all parties the ranges of use that are approved before users can gain access to a network or the Internet.

Access: The ability to physically or logically enter or make use of an IT system or area (secured or unsecured). The process of interacting with a system.

Administrator privileges: Computer system access to resources that are unavailable to most users. Administrator privileges permit execution of actions that would otherwise be restricted.

Air-gapped environment: Security measure that isolates a secure network from unsecure networks physically, electrically, and electromagnetically.

Anomalous activity: Activity that deviates from normal. The result of the process of comparing definitions of what activity is considered normal against observed events to identify significant deviations.

Antivirus/anti-malware software: A program that monitors a computer or network to identify all types of malware and prevent or contain malware incidents.

Asset: In computer security, a major application, a general-support system, a high-impact program, a physical plant, a mission-critical system, personnel, equipment, or a logically related group of systems.

Attack signature: A specific sequence of events indicative of an unauthorized access attempt.

Authentication: The process of verifying the identity of an individual user, machine, software component, or any other entity.

Availability: Whether or how often a system is available for use by its intended users. Because downtime is usually costly, availability is an integral component of security.

Baseline configuration: A set of specifications for a system, or configuration item within a system, that has been formally reviewed and agreed on at a given point in time and that can be changed only through change control procedures. The baseline configuration is used as a basis for future builds, releases, or changes.

Black holing: A method typically used by ISPs to stop a distributed denial-of-service (DDoS) attack on one of its customers. This approach to blocking DDoS attacks makes the site in question completely inaccessible to all traffic, both malicious attack traffic and legitimate user traffic.

Border router: A device located at the organization's boundary to an external network.

Change management: The broad processes for managing organizational change. Change management encompasses planning, oversight or governance, project management, testing, and implementation.

Checksum: A mathematical value that is assigned to a file and used to “test” the file at a later date to verify that the data contained in the file has not been maliciously or erroneously changed.

Classification: Categorization (e.g., “confidential,” “sensitive,” or “public”) of the information processed by the service provider on behalf of the receiver company.

Cloud computing: Generally a migration from owned resources to shared resources in which client users receive IT services on demand from third-party service providers via the Internet “cloud.” In cloud environments, a client or customer relocates its resources—such as data, applications, and services—to computing facilities outside the corporate firewall, which the end user then accesses via the Internet.

Cloud storage: A model of data storage in which the digital data is stored in logical pools, the physical storage spans multiple servers (and often locations), and the physical environment is typically owned and managed by a hosting company.

Compensating control: A management, operational, and/or technical control (e.g., safeguard or countermeasure) employed by an organization in lieu of a recommended security control in the low, moderate, or high baselines that provides equivalent or comparable protection for an information system.

Computer security: Technological and managerial procedures applied to computer systems to ensure the availability, integrity, and confidentiality of information managed by the computer system.

Confidentiality: Assuring information will be kept secret, with access limited to appropriate persons.

Configuration management: The management of security features and assurances through control of changes made to a system’s hardware, software, firmware, documentation, testing, test fixtures, and test documentation throughout the development and operational life of the system.

Consumer information: For purposes of the Information Security Standards, “consumer information” means any record about an individual, whether in paper, electronic, or other form, that is a consumer report or is derived from a consumer report that is maintained by or on behalf of a financial institution for a business purpose, such as information that an institution obtains about a loan applicant or a prospective employee from a consumer report.

Control: The means of managing risk, including policies, procedures, guidelines, practices, or organizational structures, which can be of an administrative, technical, management, or legal nature.

Control requirements: Process used to document and/or track internal processes to determine that those established procedures and/or physical security policies are being followed.

Control self-assessment: A technique used to internally assess the effectiveness of risk management and control processes.

Corrective control: A mitigating technique designed to lessen the impact to the institution when adverse events occur.

Crisis management: The process of managing an institution's operations in response to an emergency or event that threatens business continuity. An institution's ability to communicate with employees, customers, and the media, using various communications devices and methods, is a key component of crisis management.

Critical system (infrastructure): The systems and assets, whether physical or virtual, that are so vital that the incapacity or destruction of them may have a debilitating impact.

Customer: For purposes of the Information Security Standards, "customer" means a consumer with whom a financial institution has a continuing relationship under which the institution provides one or more financial products or services to the consumer that are to be used primarily for personal, family, or household purposes. In the case of a credit union, a customer relationship will exist between a credit union and certain consumers that are not the credit union's members.

Customer information: A term used in the Information Security Standards to mean any record containing non-public personal information about a customer, whether in paper, electronic, or other form, that is maintained by or on behalf of a financial institution.

Customer information systems: For purposes of the Information Security Standards, "customer information systems" means any methods used to access, collect, store, use, transmit, protect, or dispose of customer information.

Cyber attack: An attempt to damage, disrupt, or gain unauthorized access to a computer, computer system, or electronic communications network. An attack, via cyberspace, targeting an institution for the purpose of disrupting, disabling, destroying, or maliciously controlling a computing environment/infrastructure; destroying the integrity of the data; or stealing controlled information.

Cyber event: A cybersecurity change or occurrence that may have an impact on organizational operations (including mission, capabilities, or reputation).

Cyber incident: Actions taken through the use of computer networks that result in an actual or potentially adverse effect on an information system or the information residing therein.

Cyber resilience: The ability of a system or domain to withstand cyber attacks or failures and, in such events, to reestablish itself quickly.

Cyber threat: An internal or external circumstance, event, action, occurrence, or person with the potential to exploit technology-based vulnerabilities and to adversely affect (create adverse consequences for) organizational operations, organizational assets (including information and information systems), individuals, other organizations, or society.

Cybersecurity: The process of protecting consumer and bank information by preventing, detecting, and responding to attacks.

Data classification program: A program that categorizes data to convey required safeguards for information confidentiality, integrity, and availability, and establishes required controls based on value and level of sensitivity.

Data corruption: Errors in computer data that occur during writing, reading, storage, transmission, or processing, which introduce unintended changes to the original data.

Data integrity: The property that data have not been destroyed or corrupted in an unauthorized manner; maintaining and assuring the accuracy and consistency of data over their entire life cycle.

Data loss prevention (DLP) program: A comprehensive approach (covering people, processes, and systems) of implementing policies and controls designed specifically to discover, monitor, and protect confidential data while it is stored, used, or in transit over the network and at the perimeter.

Database: A collection of data that is stored on any type of computer storage medium and may be used for more than one purpose.

Defense-in-depth: Information security strategy integrating people, technology, and operations capabilities to establish variable barriers across multiple layers and dimensions of the organization.

Demilitarized zone (DMZ): A computer or small subnetwork that sits between a trusted internal network, such as a corporate private LAN, and an untrusted external network, such as the public Internet.

Detection device: A device designed to recognize an event and alert management when events occur.

Detective control: A mitigating technique designed to recognize an event and alert management when events occur.

Device: A generic term for any machine or component that attaches to a computer or connects to a network.

Distributed denial of service (DDoS): A type of attack that makes a computer resource or resources unavailable to its intended users. Although the means to carry out, motives for, and targets of a DDoS attack may vary, it generally consists of the concerted efforts of a group that intends to affect an institution's reputation by preventing an Internet site, service, or application from functioning efficiently.

Due diligence for service provider selection: Technical, functional, and financial review to verify a third-party service provider's ability to deliver the requirements specified in its proposal. The intent is to verify that the service provider has a well-developed plan and adequate resources and experience to ensure acceptable service, controls, systems backup, availability, and continuity of service to its clients.

End-of-life: All software products have life cycles. End-of-life refers to the date when a software development company no longer provides automatic fixes, updates, or online technical assistance for the product.

End-point security: Refers to a methodology of protecting the corporate network when accessed with remote devices, such as laptops, or other wireless and mobile devices. Each device with a remote connection to the network creates a potential entry (or exit) point for security threats.

End-to-end process flow: Document that details the flow of the processes, considering automated and manual control points, hardware, databases, network protocols, and real-time versus periodic processing characteristics.

Enterprise-wide: Across an entire organization, rather than a single business department or function.

Exploit: A technique or code that uses a vulnerability to provide system access to the attacker. An exploit is an intentional attack to affect an operating system or application program.

External connections: An information system or component of an information system that is outside of the authorization boundary established by the organization and for which the organization typically has no direct control over the application of required security controls or the assessment of security control effectiveness.

File transfer protocol (FTP): A standard high-level protocol for transferring files from one computer to another, usually implemented as an application-level program.

Financial Services Information Sharing and Analysis Center (FS-ISAC): A nonprofit, information-sharing forum established by financial services industry participants to facilitate the public and private sectors' sharing of physical and cybersecurity threat and vulnerability information.

Firewall: A hardware or software link in a network that relays only data packets clearly intended and authorized to reach the other side.

Frame relay: A high-performance wide area network protocol that operates at the physical and data link layers of the Open Systems Interconnection reference model. Frame relay is an example of a packet-switched technology. Packet-switched networks enable end stations to dynamically share the network medium and the available bandwidth.

Governance: In computer security, governance means setting clear expectations for the conduct (behaviors and actions) of the entity being governed and directing, controlling, and strongly influencing the entity to achieve these expectations. Governance includes specifying a framework for decision making, with assigned decision rights and accountability, intended to consistently produce desired behaviors and actions.

Gramm–Leach–Bliley Act: The act, also known as the Financial Services Modernization Act of 1999 (Pub.L. 106-102, 113 Stat. 1338, enacted November 12, 1999), required the federal banking agencies to establish information security standards for financial institutions.

Hardening: The process of securing a computer's administrative functions or inactivating those features not needed for the computer's intended business purpose.

Hardware: The physical elements of a computer system; the computer equipment as opposed to the programs or information stored in a machine.

Hash: A fixed-length cryptographic output of variables, such as a message, being operated on by a formula or cryptographic algorithm.

Hijacking: An attacker's use of an authenticated user's communication session to communicate with system components.

Homing beacons: Devices that send messages to the institution when they connect to a network and that enable recovery of the device.

Host: A computer that is accessed by a user from a remote location.

Incident management: The process of identifying, analyzing, and correcting disruptions to operations and preventing future recurrences. The goal of incident management is to limit the disruption and restore operations as quickly as possible.

Incident response plan: A plan that defines the action steps, involved resources, and communication strategy upon identification of a threat or potential threat event, such as a breach in security protocol, power or telecommunications outage, severe weather, or workplace violence.

Information security: The process by which an organization protects the creation, collection, storage, use, transmission, and disposal of information.

Information systems: Electronic systems and physical components used to access, store, transmit, protect, and eventually dispose of information. Information systems can include networks (computer systems, connections to business partners and the Internet, and the interconnections between internal and external systems). Other examples are backup tapes, mobile devices, and other media.

Information technology (IT): Any services or equipment, or interconnected system(s) or subsystem(s) of equipment that compose the institution's IT architecture or infrastructure. IT can include computers; ancillary equipment (including imaging peripherals, input, output, and storage devices necessary for security and surveillance); peripheral equipment designed to be controlled by the central processing unit of a computer; software; firmware and similar procedures; services (including cloud computing and help-desk services or other professional services that support any point of the life cycle of the equipment or service); and related resources.

Infrastructure: Describes what has been implemented by IT architecture and often includes support facilities such as power, cooling, ventilation, server and data redundancy and resilience, and telecommunications lines. Specific architecture types may exist for the following: enterprise, data (information), technology, security, and application.

Integrity: Assurance that information is trustworthy and accurate; ensuring that information will not be accidentally or maliciously altered or destroyed (see "Data integrity").

Interconnectivity: The state or quality of being connected together. The interaction of a financial institution's internal and external systems and applications and the entities with which they are linked.

Interdependencies: When two or more departments, processes, functions, or third-party service providers support one another in some fashion.

Internal "trusted" zone: A channel in which the end points are known and data integrity is protected in transit. Depending on the communications protocol used, data privacy may be protected in transit. Examples include SSLIP security and a secure physical connection.

International Organization for Standardization (ISO): An independent, non-governmental, international organization that brings together experts to share knowledge and develop voluntary, consensus-based, market-relevant international standards.

Internet: The global system of interconnected computer networks that use the Internet protocol suite (TCP/IP) to link billions of devices worldwide.

Internet service provider (ISP): A company that provides its customers with access to the Internet (e.g., AT&T, Verizon, and CenturyLink).

Intrusion detection: Techniques that attempt to detect unauthorized entry or access into a computer or network by observation of actions, security logs, or audit data; detection of break-ins or attempts, either manually or via software expert systems that operate on logs or other information available on the network.

Intrusion detection system (IDS): Software or hardware product that detects and logs inappropriate, incorrect, or anomalous activity. It gathers and analyzes information from various areas within a computer or a network to identify possible security breaches, which include both intrusions (attacks from outside the organizations) and misuse (attacks from within the organizations). IDS are typically characterized based on the source of the data they monitor: host or network. A host-based IDS uses system log files and other electronic audit data to identify suspicious activity. A network-based IDS uses a sensor to monitor packets on the network to which it is attached.

Intrusion prevention system (IPS): A system that can detect an intrusive activity and can also attempt to stop the activity, ideally before it reaches its target.

IT system inventory: A list containing information about the information resources owned or operated by an organization.

Life-cycle process: The multistep process that starts with the initiation, analysis, design, and implementation, and continues through the maintenance and disposal of the system.

Log: A record of information or events in an organized system, usually sequenced in the order in which the events occurred.

Logical access: Ability to interact with computer resources granted using identification, authentication, and authorization.

Logical access controls: The policies, procedures, organizational structure, and electronic access controls designed to restrict access to computer software and data files.

Malware: Software designed to secretly access a computer system without the owner's informed consent. The expression is a general term (short for malicious software) used to mean a variety of forms of hostile, intrusive, or annoying software or program code. Malware includes computer viruses, worms, Trojan horses, spyware, dishonest adware, ransomware, crimeware, most rootkits, and other malicious and unwanted software or programs.

Media: Physical objects that store data, such as paper, hard disk drives, tapes, and compact disks.

Metric: A quantitative measurement.

Middleware: Software that connects two or more software components or applications. It is another term for an application programmer interface or API, and it allows programmers to access lower- or higher-level services by providing an intermediary layer that includes function calls to the services.

Mobile device: A portable computing and communications device with information-storage capability. Examples include notebook and laptop computers, cellular telephones and smart phones, tablets, digital cameras, and audio recording devices.

Multi-factor authentication: The process of using two or more factors to achieve authentication. Factors include something you know (e.g., password or personal identification number); something you have (e.g., cryptographic identification device or token); and something you are (e.g., biometric).

National Institute of Standards and Technology (NIST): An agency of the U.S. Department of Commerce that works to develop and apply technology, measurements, and standards. NIST developed a voluntary cybersecurity framework based on existing standards, guidelines, and practices for reducing cyber risks to critical infrastructures.

Network: Two or more computer systems grouped together to share information, software, and hardware.

Network activity baseline: A base for determining typical utilization patterns so that significant deviations can be detected.

Network administrator: The individual responsible for the installation, management, and control of a network.

Network diagram: A description of any kind of locality in terms of its physical layout. In the context of communication networks, a topology describes pictorially the configuration or arrangement of a network, including its nodes and connecting communication lines.

Network security: The protection of computer networks and their services from unauthorized entry, modification, destruction, or disclosure, and provision of assurance that the network performs its critical functions correctly and that there are no harmful side effects. Network security includes providing for data integrity.

Non-public personal information: For purposes of the Information Security Standards, non-public personal information means (i) "personally identifiable financial information"; and (ii) any list, description, or other grouping of consumers (and publicly available information pertaining to them) that is derived using any "personally identifiable financial information" that is not publicly available.

Non-repudiation: Ensuring that a transferred message has been sent and received by the parties claiming to have sent and received the message. Non-repudiation is a way to guarantee that the sender of a message cannot later deny having sent the message and that the recipient cannot deny having received the message.

Operating system: A system that supports and manages software applications. Operating systems allocate system resources, provide access and security controls, maintain file systems, and manage communications between end users and hardware devices.

Out-of-band: Activity outside of the primary means of interfacing with the customer. For example, if a user is performing activity online, he or she may be authenticated through a one-time password sent via text message.

Outsourcing: The practice of contracting with another entity to perform services that might otherwise be conducted in-house; a contractual relationship with a third party to provide services, systems, or support.

Packet: The data unit that is routed from source to destination in a packet-switched network.

Patch: Software code that replaces or updates other code. Patches frequently are used to correct security flaws.

Penetration test: The process of using approved, qualified personnel to conduct real-world attacks against a system to identify and correct security weaknesses before they are discovered and exploited by others.

Personally identifiable financial information: For purposes of the Information Security Standards, personally identifiable financial information means information (i) a consumer provides to a financial institution to obtain a financial product or service; (ii) about a consumer resulting from any transaction involving a financial product or service between the financial institution and a consumer; or (iii) that a financial institution otherwise obtains about a consumer in connection with providing a financial product or service, such as account balance information, payment history, overdraft history, and credit or debit card purchase information; or the fact that an individual is one of the financial institution's customers.

Phishing: A digital form of social engineering that uses authentic-looking—but bogus—e-mail to request information from users or direct them to fake websites that request information.

Policy: A document that records a high-level principle or an agreed-upon course of action; overall intention and direction as formally expressed by management.

Port: Either an end point to a logical connection or a physical connection to a computer.

Positive pay: A technique that can reduce check fraud by requesting businesses to send electronic files of information to the financial institution on all checks the business has issued.

Preventive control: A mitigating technique designed to prevent an event from occurring.

Principle of least privilege: The security objective of granting users only the access needed to perform official duties.

Privilege: The level of trust with which a system object is imbued.

Privileged access: Individuals with the ability to override system or application controls.

Protocol: A format for transmitting data between devices.

Real-time network monitoring: Immediate response to a penetration attempt that is detected and diagnosed in time to prevent access.

Remote access: The ability to obtain access to a computer or network from a remote location.

Remote deletions: Use of a technology to remove data from a portable device without touching the device.

Removable media: Portable electronic storage media, such as magnetic, optical, and solid-state devices that can be inserted into and removed from a computing device and that are used to store text, video, audio, and image information. Such devices have no independent processing capabilities. Examples include hard disks, floppy disks, zip drives, compact disks, thumb drives, pen drives, and similar storage devices.

Resource: Any enterprise asset that can help the organization achieve its objectives.

Retention requirement: Requirement established by a company or by regulation for the length of time and/or for the amount of information that should be retained.

Risk analysis: The process of identifying risks, determining their probability and impact, and identifying areas needing safeguards.

Risk assessment: A prioritization of potential business disruptions based on severity and likelihood of occurrence. The risk assessment includes an analysis of threats based on the impact to the institution, its customers, and financial markets, rather than the nature of the threat.

Rogue wireless access: An unauthorized wireless node on a network.

Routing: The process of moving information from its source to the destination.

Sandbox: A restricted, controlled execution environment that prevents potentially malicious software, such as mobile code, from accessing any system resources except those for which the software is authorized.

Scenario analysis: The process of analyzing possible future events by considering alternative possible outcomes.

Secure shell: Network protocol that uses cryptography to secure communication, remote command line log-in, and remote command execution between two networked computers.

Secure Sockets Layer (SSL): A protocol that is used to transmit private documents through the Internet.

Security architecture: A detailed description of all aspects of the system that relate to security, along with a set of principles to guide the design. A security architecture describes how the system is put together to satisfy the security requirements.

Security audit: An independent review and examination of system records and activities to test for adequacy of system controls, ensure compliance with established policy and operational procedures, and recommend any indicated changes in control, policy, and procedures.

Security breach: A security event that results in unauthorized access of data, applications, services, networks, or devices by bypassing underlying security mechanisms.

Security event: An event that potentially compromises the confidentiality, integrity, availability, or accountability of an information system.

Security log: A record that contains log-in and logout activity and other security-related events and that is used to track security-related information on a computer system.

Security posture: The security status of an enterprise's networks, information, and systems based on information security and assurance resources (e.g., people, hardware, software, and policies) and capabilities in place to manage the defense of the enterprise and to react as the situation changes.

Security violation: An instance in which a user or other person circumvents or defeats the controls of a system to obtain unauthorized access to information or system resources.

Sensitive customer information: A customer's name, address, or telephone number, in conjunction with the customer's social security number, driver's license number, account number, credit or debit card number, or personal identification number or password that would permit access to the customer's account. Sensitive customer information also includes any combination of components of customer information that would allow someone to log into or access the customer's account, such as user name and password or password and account number.

Server: A computer or other device that manages a network service. An example is a print server, which is a device that manages network printing.

Service level agreement (SLA): Formal documents between an institution and its third-party service provider that outline an institution's predetermined requirements for a service and establish incentives to meet, or penalties for failure to meet, the requirements. SLAs should specify and clarify performance expectations, establish accountability, and detail remedies or consequences if performance or service quality standards are not met.

Service provider: For purposes of the Information Security Standards, service provider means any person or entity that maintains, processes, or otherwise is permitted access to customer information or consumer information through its provision of services directly to a financial institution.

Shadow IT: A term used to describe IT systems or applications used inside institutions without explicit approval.

Sniffing: The passive interception of data transmissions.

Social engineering: A general term for trying to trick people into revealing confidential information or performing certain actions.

Spear phishing: An attack targeting a specific user or group of users, and attempts to deceive the user into performing an action that launches an attack, such as opening a document or clicking a link. Spear phishers rely on knowing some personal piece of information about their target, such as an event, interest, travel plans, or current issues. Sometimes this information is gathered by hacking into the targeted network.

Spoofing: A form of masquerading in which a trusted IP address is used instead of the true IP address as a means of gaining access to a computer system.

SQL Injection Attack: An exploit of target software that constructs structured query language (SQL) statements based on user input. An attacker crafts input strings so that when the target software constructs SQL statements based on the input, the resulting SQL statement performs actions other than those the application intended. SQL injection enables an attacker to talk directly to the database, thus bypassing the application completely. Successful injection can cause information disclosure as well as the ability to add or modify data in the database.

Stateful inspection: A firewall inspection technique that examines the claimed purpose of a communication for validity. For example, a communication claiming to respond to a request is compared to a table of outstanding requests.

System administration: The process of maintaining, configuring, and operating computer systems.

System resources: Capabilities that can be accessed by a user or program either on the user's machine or across the network. Capabilities can be services, such as file or print services, or devices, such as routers.

Third-party relationship: Any business arrangement between a financial institution and another entity, by contract or otherwise.

Third-party service provider: Any third party to whom a financial institution outsources activities that the institution itself is authorized to perform, including a technology service provider.

Threat intelligence: The acquisition and analysis of information to identify, track, and predict cyber capabilities, intentions, and activities that offer courses of action to enhance decision making.

Trojan horse: Malicious code hidden in software that has an apparently beneficial or harmless use.

Tunnel: The path that encapsulated packets follow in an Internet VPN.

U.S. Computer Emergency Readiness Team (US-CERT): US-CERT is part of the U.S. Department of Homeland Security's National Cybersecurity and Communications Integration Center in the Office of Cybersecurity and Communications. US-CERT is a partnership between the Department of Homeland Security and the public and private sectors, established to protect the nation's Internet infrastructure. US-CERT coordinates defense against and responses to cyber attacks across the nation.

User identification: The process, control, or information by which a user identifies himself or herself to the system as a valid user (as opposed to authentication).

Utility: A program used to configure or maintain systems, or to make changes to stored or transmitted data.

Virtual local area network (VLAN): Logical segmentation of a LAN into different broadcast domains.

Virtual machine: A software emulation of a physical computing environment.

Virtual private network (VPN): A computer network that uses public telecommunication infrastructure, such as the Internet, to provide remote offices or individual users with secure access to their organization's network.

Virus: Malicious code that replicates itself within a computer.

Vulnerability: A hardware, firmware, or software flaw that leaves an information system open to potential exploitation; a weakness in automated system security procedures, administrative controls, physical layout, internal controls, etc., that could be exploited to gain unauthorized access to information or to disrupt critical processing.

Vulnerability assessment: Systematic examination of systems to identify, quantify, and prioritize the security deficiencies of the systems.

Worm: A self-replicating malware computer program. It uses a computer network to send copies of itself to other nodes (computers on the network), possibly without any user intervention. This occurs primarily because of security vulnerabilities on the target computers.

Zero-day attack: An attack on a piece of software that has a vulnerability for which there is no known patch.

User's Guide

Overview

In light of the increasing volume and sophistication of cyber threats, the Federal Financial Institutions Examination Council[1] (FFIEC) developed the Cybersecurity Assessment Tool (Assessment), on behalf of its members, to help institutions identify their risks and determine their cybersecurity maturity.

The content of the Assessment is consistent with the principles of the *FFIEC Information Technology Examination Handbook (IT Handbook)* and the National Institute of Standards and Technology (NIST) Cybersecurity Framework,[2] as well as industry accepted cybersecurity practices. The Assessment provides institutions with a repeatable and measureable process to inform management of their institution's risks and cybersecurity preparedness.

The Assessment consists of two parts: Inherent Risk Profile and Cybersecurity Maturity. The Inherent Risk Profile identifies the institution's inherent risk before implementing controls. The Cybersecurity Maturity includes domains, assessment factors, components, and individual declarative statements across five maturity levels to identify specific controls and practices that are in place. While management can determine the institution's maturity level in each domain, the Assessment is not designed to identify an overall cybersecurity maturity level.

To complete the Assessment, management first assesses the institution's inherent risk profile based on five categories:

- Technologies and Connection Types
- Delivery Channels
- Online/Mobile Products and Technology Services
- Organizational Characteristics
- External Threats

Management then evaluates the institution's Cybersecurity Maturity level for each of five domains:

- Cyber Risk Management and Oversight
- Threat Intelligence and Collaboration
- Cybersecurity Controls
- External Dependency Management
- Cyber Incident Management and Resilience

[1] The FFIEC comprises the principals of the following: The Board of Governors of the Federal Reserve System, Federal Deposit Insurance Corporation, National Credit Union Administration, Office of the Comptroller of the Currency, Consumer Financial Protection Bureau, and State Liaison Committee.

[2] A mapping is available in Appendix B: Mapping Cybersecurity Assessment Tool to the NIST Cybersecurity Framework. NIST reviewed and provided input on the mapping to ensure consistency with Framework principles and to highlight the complementary nature of the two resources.

By reviewing both the institution's inherent risk profile and maturity levels across the domains, management can determine whether its maturity levels are appropriate in relation to its risk. If not, the institution may take action either to reduce the level of risk or to increase the levels of maturity. This process is intended to complement, not replace, an institution's risk management process and cybersecurity program.

Background

The Assessment is based on the cybersecurity assessment that the FFIEC members piloted in 2014, which was designed to evaluate community institutions' preparedness to mitigate cyber risks. NIST defines cybersecurity as "the process of protecting information by preventing, detecting, and responding to attacks." As part of cybersecurity, institutions should consider managing internal and external threats and vulnerabilities to protect infrastructure and information assets. The definition builds on information security as defined in FFIEC guidance.

Cyber incidents can have financial, operational, legal, and reputational impact. Recent high-profile cyber attacks demonstrate that cyber incidents can significantly affect capital and earnings. Costs may include forensic investigations, public relations campaigns, legal fees, consumer credit monitoring, and technology changes. As such, cybersecurity needs to be integrated throughout an institution as part of enterprise-wide governance processes, information security, business continuity, and third-party risk management. For example, an institution's cybersecurity policies may be incorporated within the information security program. In addition, cybersecurity roles and processes referred to in the Assessment may be separate roles within the security group (or outsourced) or may be part of broader roles across the institution.

Completing the Assessment

The Assessment is designed to provide a measurable and repeatable process to assess an institution's level of cybersecurity risk and preparedness. Part one of this Assessment is the Inherent Risk Profile, which identifies an institution's inherent risk relevant to cyber risks. Part two is the Cybersecurity Maturity, which determines an institution's current state of cybersecurity preparedness represented by maturity levels across five domains. For this Assessment to be an effective risk management tool, an institution may want to complete it periodically and as significant operational and technological changes occur.

Cyber risk programs build upon and align existing information security, business continuity, and disaster recovery programs. The Assessment is intended to be used primarily on an enterprise-wide basis and when introducing new products and services as follows:

- **Enterprise-wide.** Management may review the Inherent Risk Profile and the declarative statements to understand which policies, procedures, processes, and controls are in place enterprise-wide and where gaps may exist. Following this review, management can determine appropriate maturity levels for the institution in each domain or the target state for Cybersecurity Maturity. Management can then develop action plans for achieving the target state.
- **New products, services, or initiatives.** Using the Assessment before launching a new product, service, or initiative can help management understand how these might affect the institution's inherent risk profile and resulting desired maturity levels.

Part One: Inherent Risk Profile

Part one of the Assessment identifies the institution’s inherent risk. The Inherent Risk Profile identifies activities, services, and products organized in the following categories:

- **Technologies and Connection Types.** Certain types of connections and technologies may pose a higher inherent risk depending on the complexity and maturity, connections, and nature of the specific technology products or services. This category includes the number of Internet service provider (ISP) and third-party connections, whether systems are hosted internally or outsourced, the number of unsecured connections, the use of wireless access, volume of network devices, end-of-life systems, extent of cloud services, and use of personal devices.
- **Delivery Channels.** Various delivery channels for products and services may pose a higher inherent risk depending on the nature of the specific product or service offered. Inherent risk increases as the variety and number of delivery channels increases. This category addresses whether products and services are available through online and mobile delivery channels and the extent of automated teller machine (ATM) operations.
- **Online/Mobile Products and Technology Services.** Different products and technology services offered by institutions may pose a higher inherent risk depending on the nature of the specific product or service offered. This category includes various payment services, such as debit and credit cards, person-to-person payments, originating automated clearing house (ACH), retail wire transfers, wholesale payments, merchant remote deposit capture, treasury services and clients and trust services, global remittances, correspondent banking, and merchant acquiring activities. This category also includes consideration of whether the institution provides technology services to other organizations.
- **Organizational Characteristics**. This category considers organizational characteristics, such as mergers and acquisitions, number of direct employees and cybersecurity contractors, changes in security staffing, the number of users with privileged access, changes in information technology (IT) environment, locations of business presence, and locations of operations and data centers.
- **External Threats.** The volume and type of attacks (attempted or successful) affect an institution’s inherent risk exposure. This category considers the volume and sophistication of the attacks targeting the institution.

Risk Levels

Risk Levels incorporate the type, volume, and complexity of the institution’s operations and threats directed at the institution. Inherent risk does not include mitigating controls.

Select the most appropriate inherent risk level for each activity, service, or product within each category. The levels range from Least Inherent Risk to Most Inherent Risk (Figure 1) and incorporate a wide range of descriptions. The risk levels provide parameters for determining the inherent risk for each category. These parameters are not intended to be rigid but rather instructive to assist with assessing a risk level within each activity, service, or product. For situations where the risk level falls between two levels, management should select the higher risk level.

Figure 1: Inherent Risk Profile Layout

Risk Levels

Activity, Service, or Product

Category: Technologies and Connection Types	**Risk Levels**				
	Least	**Minimal**	**Moderate**	**Significant**	**Most**
Total number of Internet service provider (ISP) connections (including branch connections)	No connections	Minimal complexity (1–20 connections)	Moderate complexity (21–100 connections)	Significant complexity (101–200 connections)	Substantial complexity (>200 connections)
Unsecured external connections, number of connections not users (e.g., file transfer protocol (FTP), Telnet, rlogin)	None	Few instances of unsecured connections (1–5)	Several instances of unsecured connections (6–10)	Significant instances of unsecured connections (11–25)	Substantial instances of unsecured connections (>25)
Wireless network access	No wireless access	Separate access points for guest wireless and corporate wireless	Guest and corporate wireless network access are logically separated; limited number of users and access points (1–250 users; 1–25 access points)	Wireless corporate network access; significant number of users and access points (251–1,000 users; 26–100 access points)	Wireless corporate network access; all employees have access; substantial number of access points (>1,000 users; >100 access points)

Determine Inherent Risk Profile

Management can determine the institution’s overall Inherent Risk Profile based on the number of applicable statements in each risk level for all activities (Figure 2). For example, when a majority of activities, products, or services fall within the Moderate Risk Level, management may determine that the institution has a Moderate Inherent Risk Profile. Each category may, however, pose a different level of inherent risk. Therefore, in addition to evaluating the number of instances that an institution selects for a specific risk level, management may also consider evaluating whether the specific category poses additional risk.

Figure 2: Inherent Risk Summary

	Risk Levels				
	Least	**Minimal**	**Moderate**	**Significant**	**Most**
Number of Statements Selected in Each Risk Level					
Based on Individual Risk Levels Selected, Assign an Inherent Risk Profile	**Least**	**Minimal**	**Moderate**	**Significant**	**Most**

The following includes definitions of risk levels.

- **Least Inherent Risk.** An institution with a Least Inherent Risk Profile generally has very limited use of technology. It has few computers, applications, systems, and no connections. The variety of products and services are limited. The institution has a small geographic footprint and few employees.
- **Minimal Inherent Risk.** An institution with a Minimal Inherent Risk Profile generally has limited complexity in terms of the technology it uses. It offers a limited variety of less risky products and services. The institution’s mission-critical systems are outsourced. The institution primarily uses established technologies. It maintains a few types of connections to customers and third parties with limited complexity.
- **Moderate Inherent Risk.** An institution with a Moderate Inherent Risk Profile generally uses technology that may be somewhat complex in terms of volume and sophistication. The

institution may outsource mission-critical systems and applications and may support elements internally. There is a greater variety of products and services offered through diverse channels.

- **Significant Inherent Risk**. An institution with a Significant Inherent Risk Profile generally uses complex technology in terms of scope and sophistication. The institution offers high-risk products and services that may include emerging technologies. The institution may host a significant number of applications internally. The institution allows either a large number of personal devices or a large variety of device types. The institution maintains a substantial number of connections to customers and third parties. A variety of payment services are offered directly rather than through a third party and may reflect a significant level of transaction volume.
- **Most Inherent Risk.** An institution with a Most Inherent Risk Profile uses extremely complex technologies to deliver myriad products and services. Many of the products and services are at the highest level of risk, including those offered to other organizations. New and emerging technologies are utilized across multiple delivery channels. The institution may outsource some mission-critical systems or applications, but many are hosted internally. The institution maintains a large number of connection types to transfer data with customers and third parties.

Part Two: Cybersecurity Maturity

After determining the Inherent Risk Profile, the institution transitions to the Cybersecurity Maturity part of the Assessment to determine the institution's maturity level within each of the following five domains:

- **Domain 1:** Cyber Risk Management and Oversight
- **Domain 2:** Threat Intelligence and Collaboration
- **Domain 3:** Cybersecurity Controls
- **Domain 4:** External Dependency Management
- **Domain 5:** Cyber Incident Management and Resilience

Domains, Assessment Factors, Components, and Declarative Statements

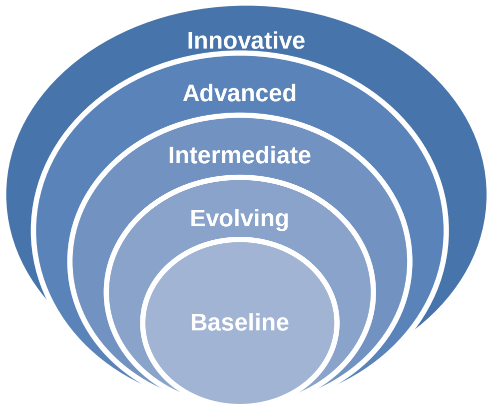
Within each domain are assessment factors and contributing components. Under each component, there are declarative statements describing an activity that supports the assessment factor at that level of maturity. Table 1 provides definitions for each domain and the underlying assessment factors.

Table 1: Domains and Assessment Factors Defined

Domains and Assessment Factors Defined	
Domain 1 **Cyber Risk Management and Oversight** Cyber risk management and oversight addresses the board of directors' (board's) oversight and management's development and implementation of an effective enterprise-wide cybersecurity program with comprehensive policies and procedures for establishing appropriate accountability and oversight.	
Assessment Factors	**Governance** includes oversight, strategies, policies, and IT asset management to implement an effective governance of the cybersecurity program. **Risk Management** includes a risk management program, risk assessment process, and audit function to effectively manage risk and assess the effectiveness of key controls. **Resources** include staffing, tools, and budgeting processes to ensure the institution's staff or external resources have knowledge and experience commensurate with the institution's risk profile. **Training and Culture** includes the employee training and customer awareness programs contributing to an organizational culture that emphasizes the mitigation of cybersecurity threats.
Domain 2 **Threat Intelligence and Collaboration** Threat intelligence and collaboration includes processes to effectively discover, analyze, and understand cyber threats, with the capability to share information internally and with appropriate third parties.	
Assessment Factors	**Threat Intelligence** refers to the acquisition and analysis of information to identify, track, and predict cyber capabilities, intentions, and activities that offer courses of action to enhance decision making. **Monitoring and Analyzing** refers to how an institution monitors threat sources and what analysis may be performed to identify threats that are specific to the institution or to resolve conflicts in the different threat intelligence streams. **Information Sharing** encompasses establishing relationships with peers and information-sharing forums and how threat information is communicated to those groups as well as internal stakeholders.
Domain 3 **Cybersecurity Controls** Cybersecurity controls are the practices and processes used to protect assets, infrastructure, and information by strengthening the institution's defensive posture through continuous, automated protection and monitoring.	
Assessment Factors	**Preventative Controls** deter and prevent cyber attacks and include infrastructure management, access management, device and end-point security, and secure coding. **Detective Controls** include threat and vulnerability detection, anomalous activity detection, and event detection, may alert the institution to network and system irregularities that indicate an incident has or may occur. **Corrective Controls** are utilized to resolve system and software vulnerabilities through patch management and remediation of issues identified during vulnerability scans and penetration testing.
Domain 4 **External Dependency Management** External dependency management involves establishing and maintaining a comprehensive program to oversee and manage external connections and third-party relationships with access to the institution's technology assets and information.	
Assessment Factors	**Connections** incorporate the identification, monitoring, and management of external connections and data flows to third parties. **Relationship Management** includes due diligence, contracts, and ongoing monitoring to help ensure controls complement the institution's cybersecurity program.

Domain 5	
Cyber Incident Management and Resilience Cyber incident management includes establishing, identifying, and analyzing cyber events; prioritizing the institution's containment or mitigation; and escalating information to appropriate stakeholders. Cyber resilience encompasses both planning and testing to maintain and recover ongoing operations during and following a cyber incident.	
Assessment Factors	**Incident Resilience Planning & Strategy** incorporates resilience planning and testing into existing business continuity and disaster recovery plans to minimize service disruptions and the destruction or corruption of data. **Detection, Response, & Mitigation** refers to the steps management takes to identify, prioritize, respond to, and mitigate the effects of internal and external threats and vulnerabilities. **Escalation & Reporting** ensures key stakeholders are informed about the impact of cyber incidents, and regulators, law enforcement, and customers are notified as required.

Figure 3: Cybersecurity Maturity Levels



Each maturity level includes a set of declarative statements that describe how the behaviors, practices, and processes of an institution can consistently produce the desired outcomes.

The Assessment starts at the Baseline maturity level and progresses to the highest maturity, the Innovative level (Figure 3). Table 2 provides definitions for each of the maturity levels, which are cumulative.

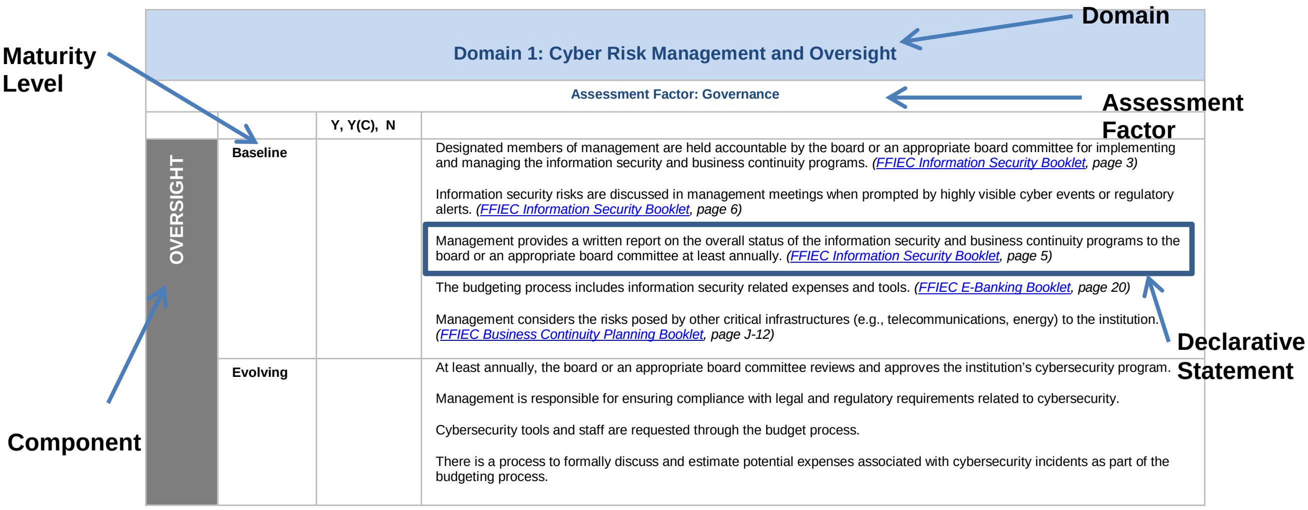
Table 2: Maturity Levels Defined

Maturity Levels Defined	
Baseline	Baseline maturity is characterized by minimum expectations required by law and regulations or recommended in supervisory guidance. This level includes compliance-driven objectives. Management has reviewed and evaluated guidance.
Evolving	Evolving maturity is characterized by additional formality of documented procedures and policies that are not already required. Risk-driven objectives are in place. Accountability for cybersecurity is formally assigned and broadened beyond protection of customer information to incorporate information assets and systems.
Intermediate	Intermediate maturity is characterized by detailed, formal processes. Controls are validated and consistent. Risk-management practices and analysis are integrated into business strategies.
Advanced	Advanced maturity is characterized by cybersecurity practices and analytics that are integrated across lines of business. Majority of risk-management processes are automated and include continuous process improvement. Accountability for risk decisions by frontline businesses is formally assigned.
Innovative	Innovative maturity is characterized by driving innovation in people, processes, and technology for the institution and the industry to manage cyber risks. This may entail developing new controls, new tools, or creating new information-sharing groups. Real-time, predictive analytics are tied to automated responses.

Completing the Cybersecurity Maturity

Each domain and maturity level has a set of declarative statements organized by assessment factor. To assist the institution's ability to follow common themes across maturity levels, statements are categorized by components. The components are groups of similar declarative statements to make the Assessment easier to use (Figure 4).

Figure 4: Cybersecurity Maturity



Management determines which declarative statements best fit the current practices of the institution. ***All declarative statements in each maturity level, and previous levels, must be attained and sustained to achieve that domain's maturity level.*** Attained and sustained requires affirmative answers to either "Yes" or "Yes with Compensating Controls"[3] for each of the declarative questions within a maturity level. While management can determine the institution's maturity level in each domain, the Assessment is not designed to identify an overall cybersecurity maturity level.

Management may determine that a declarative statement has been sufficiently sustained based on proven results. Certain declarative statements may not apply to all institutions if the product, service, or technology is not offered or used. Declarative statements that may not be applicable to all institutions are clearly designated and would not affect the determination of the specific maturity level.

Interpreting and Analyzing Assessment Results

Management can review the institution's Inherent Risk Profile in relation to its Cybersecurity Maturity results for each domain to understand whether they are aligned.

Table 3 depicts the relationship between an institution's Inherent Risk Profile and its domain Maturity Levels, as there is no single expected level for an institution. In general, as inherent risk

[3] Compensating control - A management, operational, and/or technical control (e.g., safeguard or countermeasure) employed by an organization in lieu of a recommended security control in the low, moderate, or high baselines that provides equivalent or comparable protection for an information system.

rises, an institution's maturity levels should increase. An institution's inherent risk profile and maturity levels will change over time as threats, vulnerabilities, and operational environments change. Thus, management should consider reevaluating its inherent risk profile and cybersecurity maturity periodically and when planned changes can affect its inherent risk profile (e.g., launching new products or services, new connections).

Table 3: Risk/Maturity Relationship

		Inherent Risk Levels				
		Least	**Minimal**	**Moderate**	**Significant**	**Most**
Cybersecurity Maturity Level for Each Domain	**Innovative**					
	Advanced					
	Intermediate					
	Evolving					
	Baseline					

If management determines that the institution's maturity levels are not appropriate in relation to the inherent risk profile, management should consider reducing inherent risk or developing a strategy to improve the maturity levels. This process includes

- determining target maturity levels.
- conducting a gap analysis.
- prioritizing and planning actions.
- implementing changes.
- reevaluating over time.
- communicating the results.

Management can set target maturity levels for each domain or across domains based on the institution's business objectives and risk appetite. Management can conduct a gap analysis between the current and target maturity levels and initiate improvements based on the gaps. Each declarative statement can represent a range of strategies and processes that have enterprise-wide impact. For example, declarative statements not yet attained provide insights for policies, processes, procedures, and controls that may improve risk management in relation to a specific risk or the institution's overall cybersecurity preparedness.

Using the maturity levels in each domain, management can identify potential actions that would increase the institution's overall cybersecurity preparedness. Management can review declarative statements at maturity levels beyond what the institution has achieved to determine the actions needed to reach the next level and implement changes to address gaps. Management's periodic reevaluations of the inherent risk profile and maturity levels may further assist the institution in maintaining an appropriate level of cybersecurity preparedness. In addition, management may also seek an independent validation, such as by the internal audit function, of the institution's Assessment process and findings.

The Assessment results should be communicated to the chief executive officer (CEO) and board. More information and questions to consider are contained in the "Overview for Chief Executive Officers and Boards of Directors."

Resources

In addition to the "Overview for Chief Executive Officers and Boards of Directors," the FFIEC has released the following documents to assist institutions with the Cybersecurity Assessment Tool.

- Appendix A: Mapping Baseline Statements to FFIEC IT Examination Handbook
- Appendix B: Mapping Cybersecurity Assessment Tool to NIST Cybersecurity Framework
- Appendix C: Glossary

Inherent Risk Profile

Category: Technologies and Connection Types	Risk Levels				
	Least	Minimal	Moderate	Significant	Most
Total number of Internet service provider (ISP) connections (including branch connections)	No connections	Minimal complexity (1–20 connections)	Moderate complexity (21–100 connections)	Significant complexity (101–200 connections)	Substantial complexity (>200 connections)
Unsecured external connections, number of connections not users (e.g., file transfer protocol (FTP), Telnet, rlogin)	None	Few instances of unsecured connections (1–5)	Several instances of unsecured connections (6–10)	Significant instances of unsecured connections (11–25)	Substantial instances of unsecured connections (>25)
Wireless network access	No wireless access	Separate access points for guest wireless and corporate wireless	Guest and corporate wireless network access are logically separated; limited number of users and access points (1–250 users; 1–25 access points)	Wireless corporate network access; significant number of users and access points (251–1,000 users; 26–100 access points)	Wireless corporate network access; all employees have access; substantial number of access points (>1,000 users; >100 access points)
Personal devices allowed to connect to the corporate network	None	Only one device type available; available to <5% of employees (staff, executives, managers); e-mail access only	Multiple device types used; available to <10% of employees (staff, executives, managers) and board; e-mail access only	Multiple device types used; available to <25% of authorized employees (staff, executives, managers) and board; e-mail and some applications accessed	Any device type used; available to >25% of employees (staff, executives, managers) and board; all applications accessed
Third parties, including number of organizations and number of individuals from vendors and subcontractors, with access to internal systems (e.g., virtual private network, modem, intranet, direct connection)	No third parties and no individuals from third parties with access to systems	Limited number of third parties (1–5) and limited number of individuals from third parties (<50) with access; low complexity in how they access systems	Moderate number of third parties (6–10) and moderate number of individuals from third parties (50–500) with access; some complexity in how they access systems	Significant number of third parties (11–25) and significant number of individuals from third parties (501–1,500) with access; high level of complexity in terms of how they access systems	Substantial number of third parties (>25) and substantial number of individuals from third parties (>1,500) with access; high complexity in how they access systems

Category: Technologies and Connection Types	Risk Levels				
	Least	**Minimal**	**Moderate**	**Significant**	**Most**
Wholesale customers with dedicated connections	None	Few dedicated connections (between 1–5)	Several dedicated connections (between 6–10)	Significant number of dedicated connections (between 11–25)	Substantial number of dedicated connections (>25)
Internally hosted and developed or modified vendor applications supporting critical activities	No applications	Few applications (between 1–5)	Several applications (between 6–10)	Significant number of applications (between 11–25)	Substantial number of applications and complexity (>25)
Internally hosted, vendor-developed applications supporting critical activities	Limited applications (0–5)	Few applications (6–30)	Several applications (31–75)	Significant number of applications (76–200)	Substantial number of applications and complexity (>200)
User-developed technologies and user computing that support critical activities (includes Microsoft Excel spreadsheets and Access databases or other user-developed tools)	No user-developed technologies	1–100 technologies	101–500 technologies	501–2,500 technologies	>2,500 technologies
End-of-life (EOL) systems	No systems (hardware or software) that are past EOL or at risk of nearing EOL within 2 years	Few systems that are at risk of EOL and none that support critical operations	Several systems that will reach EOL within 2 years and some that support critical operations	A large number of systems that support critical operations at EOL or are at risk of reaching EOL in 2 years	Majority of critical operations dependent on systems that have reached EOL or will reach EOL within the next 2 years or an unknown number of systems that have reached EOL
Open Source Software (OSS)	No OSS	Limited OSS and none that support critical operations	Several OSS that support critical operations	Large number of OSS that support critical operations	Majority of operations dependent on OSS
Network devices (e.g., servers, routers, and firewalls; include physical and virtual)	Limited or no network devices (<250)	Few devices (250–1,500)	Several devices (1,501–25,000)	Significant number of devices (25,001–50,000)	Substantial number of devices (>50,000)
Third-party service providers storing and/or processing information that support critical activities (Do not have access to internal systems, but the institution relies on their services)	No third parties that support critical activities	1–25 third parties that support critical activities	26–100 third parties that support critical activities	101–200 third parties that support critical activities; 1 or more are foreign-based	>200 third parties that support critical activities; 1 or more are foreign-based

Category: Technologies and Connection Types	Risk Levels				
	Least	Minimal	Moderate	Significant	Most
Cloud computing services hosted externally to support critical activities	No cloud providers	Few cloud providers; private cloud only (1–3)	Several cloud providers (4–7)	Significant number of cloud providers (8–10); cloud-provider locations used include international; use of public cloud	Substantial number of cloud providers (>10); cloud-provider locations used include international; use of public cloud

Category: Delivery Channels	Risk Levels				
	Least	Minimal	Moderate	Significant	Most
Online presence (customer)	No Web-facing applications or social media presence	Serves as an informational Web site or social media page (e.g., provides branch and ATM locations and marketing materials)	Serves as a delivery channel for retail online banking; may communicate to customers through social media	Serves as a delivery channel for wholesale customers; may include retail account origination	Internet applications serve as a channel to wholesale customers to manage large value assets
Mobile presence	None	SMS text alerts or notices only; browser-based access	Mobile banking application for retail customers (e.g., bill payment, mobile check capture, internal transfers only)	Mobile banking application includes external transfers (e.g., for corporate clients, recurring external transactions)	Full functionality, including originating new transactions (e.g., ACH, wire)
Automated Teller Machines (ATM) (Operation)	No ATM services	ATM services offered but no owned machines	ATM services managed by a third party; ATMs at local and regional branches; cash reload services outsourced	ATM services managed internally; ATMs at U.S. branches and retail locations; cash reload services outsourced	ATM services managed internally; ATM services provided to other financial institutions; ATMs at domestic and international branches and retail locations; cash reload services managed internally

Category: Online/Mobile Products and Technology Services	Risk Levels				
	Least	**Minimal**	**Moderate**	**Significant**	**Most**
Issue debit or credit cards	Do not issue debit or credit cards	Issue debit and/or credit cards through a third party; <10,000 cards outstanding	Issue debit or credit cards through a third party; between 10,000–50,000 cards outstanding	Issue debit or credit cards directly; between 50,000–100,000 cards outstanding	Issue debit or credit cards directly; >100,000 cards outstanding; issue cards on behalf of other financial institutions
Prepaid cards	Do not issue prepaid cards	Issue prepaid cards through a third party; <5,000 cards outstanding	Issue prepaid cards through a third party; 5,000–10,000 cards outstanding	Issue prepaid cards through a third party; 10,001–20,000 cards outstanding	Issue prepaid cards internally, through a third party, or on behalf of other financial institutions; >20,000 cards outstanding
Emerging payments technologies (e.g., digital wallets, mobile wallets)	Do not accept or use emerging payments technologies	Indirect acceptance or use of emerging payments technologies (customer use may affect deposit or credit account)	Direct acceptance or use of emerging payments technologies; partner or co-brand with non-bank providers; limited transaction volume	Direct acceptance or use of emerging payments technologies; small transaction volume; no foreign payments	Direct acceptance of emerging payments technologies; moderate transaction volume and/or foreign payments
Person-to-person payments (P2P)	Not offered	Customers allowed to originate payments; used by <1,000 customers or monthly transaction volume is <50,000	Customers allowed to originate payments; used by 1,000–5,000 customers or monthly transaction volume is between 50,000–100,000	Customers allowed to originate payments; used by 5,001–10,000 customers or monthly transaction volume is between 100,001–1 million	Customers allowed to request payment or to originate payment; used by >10,000 customers or monthly transaction volume >1 million
Originating ACH payments	No ACH origination	Originate ACH credits; daily volume <3% of total assets	Originate ACH debits and credits; daily volume is 3%–5% of total assets	Sponsor third-party payment processor; originate ACH debits and credits with daily volume 6%–25% of total assets	Sponsor nested third-party payment processors; originate debits and credits with daily volume that is >25% of total assets
Originating wholesale payments (e.g., CHIPS)	Do not originate wholesale payments	Daily originated wholesale payment volume <3% of total assets	Daily originated wholesale payment volume 3%–5% of total assets	Daily originated wholesale payment volume 6%–25% of total assets	Daily originated wholesale payment volume >25% of total assets

Category: Online/Mobile Products and Technology Services	Risk Levels				
	Least	**Minimal**	**Moderate**	**Significant**	**Most**
Wire transfers	Not offered	In person wire requests only; domestic wires only; daily wire volume <3% of total assets	In person, phone, and fax wire requests; domestic daily wire volume 3%–5% of total assets; international daily wire volume <3% of total assets	Multiple request channels (e.g., online, text, e-mail, fax, and phone); daily domestic wire volume 6%–25% of total assets; daily international wire volume 3%–10% of total assets	Multiple request channels (e.g., online, text, e-mail, fax, and phone); daily domestic wire volume >25% of total assets; daily international wire volume >10% of total assets
Merchant remote deposit capture (RDC)	Do not offer Merchant RDC	<100 merchant clients; daily volume of transactions is <3% of total assets	100–500 merchant clients; daily volume of transactions is 3%–5% of total assets	501–1,000 merchant clients; daily volume of transactions is 6%–25% of total assets	>1,000 merchant clients; daily volume of transactions is >25% of total assets
Global remittances	Do not offer global remittances	Gross daily transaction volume is <3% of total assets	Gross daily transaction volume is 3%–5% of total assets	Gross daily transaction volume is 6%–25% of total assets	Gross daily transaction volume is >25% of total assets
Treasury services and clients	No treasury management services are offered	Limited services offered; number of clients is <1,000	Services offered include lockbox, ACH origination, and remote deposit capture; number of clients is between 1,000–10,000	Services offered include accounts receivable solutions and liquidity management; number of clients is between 10,001–20,000	Multiple services offered including currency services, online investing, and investment sweep accounts; number of clients is >20,000
Trust services	Trust services are not offered	Trust services are offered through a third-party provider; assets under management total <$500 million	Trust services provided directly; portfolio of assets under management total $500 million–$999 million	Trust services provided directly; assets under management total $1 billion–$10 billion	Trust services provided directly; assets under management total >$10 billion
Act as a correspondent bank (Interbank transfers)	Do not act as a correspondent bank	Act as a correspondent bank for <100 institutions	Act as a correspondent bank for 100–250 institutions	Act as a correspondent bank for 251–500 institutions	Act as a correspondent bank for >500 institutions

Category: Online/Mobile Products and Technology Services	Risk Levels				
	Least	Minimal	Moderate	Significant	Most
Merchant acquirer (sponsor merchants or card processor activity into the payment system)	Do not act as a merchant acquirer	Act as a merchant acquirer; <1,000 merchants	Act as a merchant acquirer; outsource card payment processing; 1,000–10,000 merchants	Act as a merchant acquirer and card payment processor; 10,001–100,000 merchants	Act as a merchant acquirer and card payment processor; >100,000 merchants
Host IT services for other organizations (either through joint systems or administrative support)	Do not provide IT services for other organizations	Host or provide IT services for affiliated organizations	Host or provide IT services for up to 25 unaffiliated organizations	Host or provide IT services for 26–50 unaffiliated organizations	Host or provide IT services for >50 unaffiliated organizations

Category: Organizational Characteristics	Risk Levels				
	Least	Minimal	Moderate	Significant	Most
Mergers and acquisitions (including divestitures and joint ventures)	None planned	Open to initiating discussions or actively seeking a merger or acquisition	In discussions with at least 1 party	A sale or acquisition has been publicly announced within the past year, in negotiations with 1 or more parties	Multiple ongoing integrations of acquisitions are in process
Direct employees (including information technology and cybersecurity contractors)	Number of employees totals <50	Number of employees totals 50–2,000	Number of employees totals 2,001–10,000	Number of employees totals 10,001–50,000	Number of employees is >50,000
Changes in IT and information security staffing	Key positions filled; low or no turnover of personnel	Staff vacancies exist for non-critical roles	Some turnover in key or senior positions	Frequent turnover in key staff or senior positions	Vacancies in senior or key positions for long periods; high level of employee turnover in IT or information security
Privileged access (Administrators–network, database, applications, systems, etc.)	Limited number of administrators; limited or no external administrators	Level of turnover in administrators does not affect operations or activities; may utilize some external administrators	Level of turnover in administrators affects operations; number of administrators for individual systems or applications exceeds what is necessary	High reliance on external administrators; number of administrators is not sufficient to support level or pace of change	High employee turnover in network administrators; many or most administrators are external (contractors or vendors); experience in network administration is limited

Category: Organizational Characteristics	Risk Levels				
	Least	**Minimal**	**Moderate**	**Significant**	**Most**
Changes in IT environment (e.g., network, infrastructure, critical applications, technologies supporting new products or services)	Stable IT environment	Infrequent or minimal changes in the IT environment	Frequent adoption of new technologies	Volume of significant changes is high	Substantial change in outsourced provider(s) of critical IT services; large and complex changes to the environment occur frequently
Locations of branches/business presence	1 state	1 region	1 country	1–20 countries	>20 countries
Locations of operations/data centers	1 state	1 region	1 country	1–10 countries	>10 countries

Category: External Threats	Risk Levels				
	Least	**Minimal**	**Moderate**	**Significant**	**Most**
Attempted cyber attacks	No attempted attacks or reconnaissance	Few attempts monthly (<100); may have had generic phishing campaigns received by employees and customers	Several attempts monthly (100– 500); phishing campaigns targeting employees or customers at the institution or third parties supporting critical activities; may have experienced an attempted Distributed Denial of Service (DDoS) attack within the last year	Significant number of attempts monthly (501–100,000); spear phishing campaigns targeting high net worth customers and employees at the institution or third parties supporting critical activities; Institution specifically is named in threat reports; may have experienced multiple attempted DDoS attacks within the last year	Substantial number of attempts monthly (>100,000); persistent attempts to attack senior management and/or network administrators; frequently targeted for DDoS attacks

Cybersecurity Maturity

Domain 1: Cyber Risk Management and Oversight			
Assessment Factor: Governance			
		Y, Y(C), N	
OVERSIGHT	**Baseline**		Designated members of management are held accountable by the board or an appropriate board committee for implementing and managing the information security and business continuity programs. *(FFIEC Information Security Booklet, page 3)* Information security risks are discussed in management meetings when prompted by highly visible cyber events or regulatory alerts. *(FFIEC Information Security Booklet, page 6)* Management provides a written report on the overall status of the information security and business continuity programs to the board or an appropriate board committee at least annually. *(FFIEC Information Security Booklet, page 5)* The budgeting process includes information security related expenses and tools. *(FFIEC E-Banking Booklet, page 20)* Management considers the risks posed by other critical infrastructures (e.g., telecommunications, energy) to the institution. *(FFIEC Business Continuity Planning Booklet, page J-12)*
	Evolving		At least annually, the board or an appropriate board committee reviews and approves the institution's cybersecurity program. Management is responsible for ensuring compliance with legal and regulatory requirements related to cybersecurity. Cybersecurity tools and staff are requested through the budget process. There is a process to formally discuss and estimate potential expenses associated with cybersecurity incidents as part of the budgeting process.
	Intermediate		The board or an appropriate board committee has cybersecurity expertise or engages experts to assist with oversight responsibilities. The standard board meeting package includes reports and metrics that go beyond events and incidents to address threat intelligence trends and the institution's security posture. The institution has a cyber risk appetite statement approved by the board or an appropriate board committee. Cyber risks that exceed the risk appetite are escalated to management. The board or an appropriate board committee ensures management's

			annual cybersecurity self-assessment evaluates the institution's ability to meet its cyber risk management standards. The board or an appropriate board committee reviews and approves management's prioritization and resource allocation decisions based on the results of the cyber assessments. The board or an appropriate board committee ensures management takes appropriate actions to address changing cyber risks or significant cybersecurity issues. The budget process for requesting additional cybersecurity staff and tools is integrated into business units' budget processes.
	Advanced		The board or board committee approved cyber risk appetite statement is part of the enterprise-wide risk appetite statement. Management has a formal process to continuously improve cybersecurity oversight. The budget process for requesting additional cybersecurity staff and tools maps current resources and tools to the cybersecurity strategy. Management and the board or an appropriate board committee hold business units accountable for effectively managing all cyber risks associated with their activities. Management identifies root cause(s) when cyber attacks result in material loss. The board or an appropriate board committee ensures that management's actions consider the cyber risks that the institution poses to the financial sector.
	Innovative		The board or an appropriate board committee discusses ways for management to develop cybersecurity improvements that may be adopted sector-wide. The board or an appropriate board committee verifies that management's actions consider the cyber risks that the institution poses to other critical infrastructures (e.g., telecommunications, energy).

STRATEGY/ POLICIES			
	Baseline		The institution has an information security strategy that integrates technology, policies, procedures, and training to mitigate risk. *(FFIEC Information Security Booklet, page 3)* The institution has policies commensurate with its risk and complexity that address the concepts of information technology risk management. *(FFIEC Information Security Booklet, page, 16)* The institution has policies commensurate with its risk and complexity that address the concepts of threat information sharing. *(FFIEC E-Banking Booklet, page 28)* The institution has board-approved policies commensurate with its risk and complexity that address information security. *(FFIEC Information Security Booklet, page 16)* The institution has policies commensurate with its risk and complexity that address the concepts of external dependency or third-party management. *(FFIEC Outsourcing Booklet, page 2)* The institution has policies commensurate with its risk and complexity that address the concepts of incident response and resilience. (*FFIEC Information Security Booklet, page 83)* All elements of the information security program are coordinated enterprise-wide. *(FFIEC Information Security Booklet, page 7)*
	Evolving		The institution augmented its information security strategy to incorporate cybersecurity and resilience. The institution has a formal cybersecurity program that is based on technology and security industry standards or benchmarks. A formal process is in place to update policies as the institution's inherent risk profile changes.
	Intermediate		The institution has a comprehensive set of policies commensurate with its risk and complexity that address the concepts of threat intelligence. Management periodically reviews the cybersecurity strategy to address evolving cyber threats and changes to the institution's inherent risk profile. The cybersecurity strategy is incorporated into, or conceptually fits within, the institution's enterprise-wide risk management strategy. Management links strategic cybersecurity objectives to tactical goals. A formal process is in place to cross-reference and simultaneously update all policies related to cyber risks across business lines.

	Advanced		The cybersecurity strategy outlines the institution's future state of cybersecurity with short-term and long-term perspectives. Industry-recognized cybersecurity standards are used as sources during the analysis of cybersecurity program gaps. The cybersecurity strategy identifies and communicates the institution's role as a component of critical infrastructure in the financial services industry. The risk appetite is informed by the institution's role in critical infrastructure. Management is continuously improving the existing cybersecurity program to adapt as the desired cybersecurity target state changes.
	Innovative		The cybersecurity strategy identifies and communicates the institution's role as it relates to other critical infrastructures.
IT ASSET MANAGEMENT	**Baseline**		An inventory of organizational assets (e.g., hardware, software, data, and systems hosted externally) is maintained. *(FFIEC Information Security Booklet, page 9)* Organizational assets (e.g., hardware, systems, data, and applications) are prioritized for protection based on the data classification and business value. *(FFIEC Information Security Booklet, page 12)* Management assigns accountability for maintaining an inventory of organizational assets. *(FFIEC Information Security Booklet, page 9)* A change management process is in place to request and approve changes to systems configurations, hardware, software, applications, and security tools. *(FFIEC Information Security Booklet, page 56)*
	Evolving		The asset inventory, including identification of critical assets, is updated at least annually to address new, relocated, re-purposed, and sunset assets. The institution has a documented asset life-cycle process that considers whether assets to be acquired have appropriate security safeguards. The institution proactively manages system EOL (e.g., replacement) to limit security risks. Changes are formally approved by an individual or committee with appropriate authority and with separation of duties.
	Intermediate		Baseline configurations cannot be altered without a formal change request, documented approval, and an assessment of security implications. A formal IT change management process requires cybersecurity risk to be evaluated during the analysis, approval, testing, and reporting of changes.

	Advanced		Supply chain risk is reviewed before the acquisition of mission-critical information systems including system components. Automated tools enable tracking, updating, asset prioritizing, and custom reporting of the asset inventory. Automated processes are in place to detect and block unauthorized changes to software and hardware. The change management system uses thresholds to determine when a risk assessment of the impact of the change is required.
	Innovative		A formal change management function governs decentralized or highly distributed change requests and identifies and measures security risks that may cause increased exposure to cyber attack. Comprehensive automated enterprise tools are implemented to detect and block unauthorized changes to software and hardware.
Assessment Factor: Risk Management			
RISK MANAGEMENT PROGRAM	**Baseline**		An information security and business continuity risk management function(s) exists within the institution. *(FFIEC Information Security Booklet, page 68)*
	Evolving		The risk management program incorporates cyber risk identification, measurement, mitigation, monitoring, and reporting. Management reviews and uses the results of audits to improve existing cybersecurity policies, procedures, and controls. Management monitors moderate and high residual risk issues from the cybersecurity risk assessment until items are addressed.
	Intermediate		The cybersecurity function has a clear reporting line that does not present a conflict of interest. The risk management program specifically addresses cyber risks beyond the boundaries of the technological impacts (e.g., financial, strategic, regulatory, compliance). Benchmarks or target performance metrics have been established for showing improvements or regressions of the security posture over time. Management uses the results of independent audits and reviews to improve cybersecurity. There is a process to analyze and assign potential losses and related expenses, by cost center, associated with cybersecurity incidents.

	Advanced		Cybersecurity metrics are used to facilitate strategic decision-making and funding in areas of need. Independent risk management sets and monitors cyber-related risk limits for business units. Independent risk management staff escalates to management and the board or an appropriate board committee significant discrepancies from business unit's assessments of cyber-related risk. A process is in place to analyze the financial impact cyber incidents have on the institution's capital. The cyber risk data aggregation and real-time reporting capabilities support the institution's ongoing reporting needs, particularly during cyber incidents.
	Innovative		The risk management function identifies and analyzes commonalities in cyber events that occur both at the institution and across other sectors to enable more predictive risk management. A process is in place to analyze the financial impact that a cyber incident at the institution may have across the financial sector.
RISK ASSESSMENT	**Baseline**		A risk assessment focused on safeguarding customer information identifies reasonable and foreseeable internal and external threats, the likelihood and potential damage of threats, and the sufficiency of policies, procedures, and customer information systems. *(FFIEC Information Security Booklet, page 8)* The risk assessment identifies internet-based systems and high-risk transactions that warrant additional authentication controls. *(FFIEC Information Security Booklet, page 12)* The risk assessment is updated to address new technologies, products, services, and connections before deployment. *(FFIEC Information Security Booklet, page 13)*
	Evolving		Risk assessments are used to identify the cybersecurity risks stemming from new products, services, or relationships. The focus of the risk assessment has expanded beyond customer information to address all information assets. The risk assessment considers the risk of using EOL software and hardware components.
	Intermediate		The risk assessment is adjusted to consider widely known risks or risk management practices.

	Advanced		An enterprise-wide risk management function incorporates cyber threat analysis and specific risk exposure as part of the enterprise risk assessment.
	Innovative		The risk assessment is updated in real time as changes to the risk profile occur, new applicable standards are released or updated, and new exposures are anticipated. The institution uses information from risk assessments to predict threats and drive real-time responses. Advanced or automated analytics offer predictive information and real-time risk metrics.
AUDIT	**Baseline**		Independent audit or review evaluates policies, procedures, and controls across the institution for significant risks and control issues associated with the institution's operations, including risks in new products, emerging technologies, and information systems. *(FFIEC Audit Booklet, page 4)* The independent audit function validates controls related to the storage or transmission of confidential data. *(FFIEC Audit Booklet, page 1)* Logging practices are independently reviewed periodically to ensure appropriate log management (e.g., access controls, retention, and maintenance). *(FFIEC Operations Booklet, page 29)* Issues and corrective actions from internal audits and independent testing/assessments are formally tracked to ensure procedures and control lapses are resolved in a timely manner. *(FFIEC Information Security Booklet, page 6)*
	Evolving		The independent audit function validates that the risk management function is commensurate with the institution's risk and complexity. The independent audit function validates that the institution's threat information sharing is commensurate with the institution's risk and complexity. The independent audit function validates that the institution's cybersecurity controls function is commensurate with the institution's risk and complexity. The independent audit function validates that the institution's third-party relationship management is commensurate with the institution's risk and complexity. The independent audit function validates that the institution's incident response program and resilience are commensurate with the institution's risk and complexity.

	Intermediate		A formal process is in place for the independent audit function to update its procedures based on changes to the institution's inherent risk profile. The independent audit function validates that the institution's threat intelligence and collaboration are commensurate with the institution's risk and complexity. The independent audit function regularly reviews management's cyber risk appetite statement. Independent audits or reviews are used to identify gaps in existing security capabilities and expertise.
	Advanced		A formal process is in place for the independent audit function to update its procedures based on changes to the evolving threat landscape across the sector. The independent audit function regularly reviews the institution's cyber risk appetite statement in comparison to assessment results and incorporates gaps into the audit strategy. Independent audits or reviews are used to identify cybersecurity weaknesses, root causes, and the potential impact to business units.
	Innovative		A formal process is in place for the independent audit function to update its procedures based on changes to the evolving threat landscape across other sectors the institution depends upon. The independent audit function uses sophisticated data mining tools to perform continuous monitoring of cybersecurity processes or controls.
Assessment Factor: Resources			
STAFFING	**Baseline**		Information security roles and responsibilities have been identified. *(FFIEC Information Security Booklet, page 7)* Processes are in place to identify additional expertise needed to improve information security defenses. *(FFIEC Information Security Work Program, Objective I: 2-8)*

	Evolving		A formal process is used to identify cybersecurity tools and expertise that may be needed. Management with appropriate knowledge and experience leads the institution's cybersecurity efforts. Staff with cybersecurity responsibilities have the requisite qualifications to perform the necessary tasks of the position. Employment candidates, contractors, and third parties are subject to background verification proportional to the confidentiality of the data accessed, business requirements, and acceptable risk.
	Intermediate		The institution has a program for talent recruitment, retention, and succession planning for the cybersecurity and resilience staffs.
	Advanced		The institution benchmarks its cybersecurity staffing against peers to identify whether its recruitment, retention, and succession planning are commensurate. Dedicated cybersecurity staff develops, or contributes to developing, integrated enterprise-level security and cyber defense strategies.
	Innovative		The institution actively partners with industry associations and academia to inform curricula based on future cybersecurity staffing needs of the industry.
Assessment Factor: Training and Culture			
TRAINING	**Baseline**		Annual information security training is provided. *(FFIEC Information Security Booklet, page 66)* Annual information security training includes incident response, current cyber threats (e.g., phishing, spear phishing, social engineering, and mobile security), and emerging issues. *(FFIEC Information Security Booklet, page 66)* Situational awareness materials are made available to employees when prompted by highly visible cyber events or by regulatory alerts. *(FFIEC Information Security Booklet, page 7)* Customer awareness materials are readily available (e.g., DHS' Cybersecurity Awareness Month materials). *(FFIEC E-Banking Work Program, Objective 6-3)*

	Evolving		The institution has a program for continuing cybersecurity training and skill development for cybersecurity staff. Management is provided cybersecurity training relevant to their job responsibilities. Employees with privileged account permissions receive additional cybersecurity training commensurate with their levels of responsibility. Business units are provided cybersecurity training relevant to their particular business risks. The institution validates the effectiveness of training (e.g., social engineering or phishing tests).
	Intermediate		Management incorporates lessons learned from social engineering and phishing exercises to improve the employee awareness programs. Cybersecurity awareness information is provided to retail customers and commercial clients at least annually. Business units are provided cybersecurity training relevant to their particular business risks, over and above what is required of the institution as a whole. The institution routinely updates its training to security staff to adapt to new threats.
	Advanced		Independent directors are provided with cybersecurity training that addresses how complex products, services, and lines of business affect the institution's cyber risk.
	Innovative		Key performance indicators are used to determine whether training and awareness programs positively influence behavior.
CULTURE	**Baseline**		Management holds employees accountable for complying with the information security program. *(FFIEC Information Security Booklet, page 7)*
	Evolving		The institution has formal standards of conduct that hold all employees accountable for complying with cybersecurity policies and procedures. Cyber risks are actively discussed at business unit meetings. Employees have a clear understanding of how to identify and escalate potential cybersecurity issues.

	Intermediate		Management ensures performance plans are tied to compliance with cybersecurity policies and standards in order to hold employees accountable. The risk culture requires formal consideration of cyber risks in all business decisions. Cyber risk reporting is presented and discussed at the independent risk management meetings.
	Advanced		Management ensures continuous improvement of cyber risk cultural awareness.
	Innovative		The institution leads efforts to promote cybersecurity culture across the sector and to other sectors that they depend upon.

Domain 2: Threat Intelligence and Collaboration

Assessment Factor: Threat Intelligence

		Y, Y(C), N	
THREAT INTELLIGENCE AND INFORMATION	**Baseline**		The institution belongs or subscribes to a threat and vulnerability information sharing source(s) that provides information on threats (e.g., Financial Services Information Sharing and Analysis Center [FS-ISAC], U.S. Computer Emergency Readiness Team [US-CERT]). *(FFIEC E-Banking Work Program, page 28)* Threat information is used to monitor threats and vulnerabilities. *(FFIEC Information Security Booklet, page 83)* Threat information is used to enhance internal risk management and controls. *(FFIEC Information Security Booklet, page 4)*
	Evolving		Threat information received by the institution includes analysis of tactics, patterns, and risk mitigation recommendations.
	Intermediate		A formal threat intelligence program is implemented and includes subscription to threat feeds from external providers and internal sources. Protocols are implemented for collecting information from industry peers and government. A read-only, central repository of cyber threat intelligence is maintained.
	Advanced		A cyber intelligence model is used for gathering threat information. Threat intelligence is automatically received from multiple sources in real time. The institution’s threat intelligence includes information related to geopolitical events that could increase cybersecurity threat levels.
	Innovative		A threat analysis system automatically correlates threat data to specific risks and then takes risk-based automated actions while alerting management. The institution is investing in the development of new threat intelligence and collaboration mechanisms (e.g., technologies, business processes) that will transform how information is gathered and shared.

Assessment Factor: Monitoring and Analyzing			
MONITORING AND ANALYZING	**Baseline**		Audit log records and other security event logs are reviewed and retained in a secure manner. *(FFIEC Information Security Booklet, page 79)* Computer event logs are used for investigations once an event has occurred. *(FFIEC Information Security Booklet, page 83)*
	Evolving		A process is implemented to monitor threat information to discover emerging threats. The threat information and analysis process is assigned to a specific group or individual. Security processes and technology are centralized and coordinated in a Security Operations Center (SOC) or equivalent. Monitoring systems operate continuously with adequate support for efficient incident handling.
	Intermediate		A threat intelligence team is in place that evaluates threat intelligence from multiple sources for credibility, relevance, and exposure. A profile is created for each threat that identifies the likely intent, capability, and target of the threat. Threat information sources that address all components of the threat profile are prioritized and monitored. Threat intelligence is analyzed to develop cyber threat summaries including risks to the institution and specific actions for the institution to consider.
	Advanced		A dedicated cyber threat identification and analysis committee or team exists to centralize and coordinate initiatives and communications. Formal processes have been defined to resolve potential conflicts in information received from sharing and analysis centers or other sources. Emerging internal and external threat intelligence and correlated log analysis are used to predict future attacks. Threat intelligence is viewed within the context of the institution's risk profile and risk appetite to prioritize mitigating actions in anticipation of threats. Threat intelligence is used to update architecture and configuration standards.

	Innovative		The institution uses multiple sources of intelligence, correlated log analysis, alerts, internal traffic flows, and geopolitical events to predict potential future attacks and attack trends. Highest risk scenarios are used to predict threats against specific business targets. IT systems automatically detect configuration weaknesses based on threat intelligence and alert management so actions can be prioritized.
Assessment Factor: Information Sharing			
INFORMATION SHARING	**Baseline**		Information security threats are gathered and shared with applicable internal employees. *(FFIEC Information Security Booklet, page 83)* Contact information for law enforcement and the regulator(s) is maintained and updated regularly. *(FFIEC Business Continuity Planning Work Program, Objective I: 5-1)* Information about threats is shared with law enforcement and regulators when required or prompted. *(FFIEC Information Security Booklet, page 84)*
	Evolving		A formal and secure process is in place to share threat and vulnerability information with other entities. A representative from the institution participates in law enforcement or information-sharing organization meetings.
	Intermediate		A formal protocol is in place for sharing threat, vulnerability, and incident information to employees based on their specific job function. Information-sharing agreements are used as needed or required to facilitate sharing threat information with other financial sector organizations or third parties. Information is shared proactively with the industry, law enforcement, regulators, and information-sharing forums. A process is in place to communicate and collaborate with the public sector regarding cyber threats.
	Advanced		Management communicates threat intelligence with business risk context and specific risk management recommendations to the business units. Relationships exist with employees of peer institutions for sharing cyber threat intelligence. A network of trust relationships (formal and/or informal) has been established to evaluate information about cyber threats.

	Innovative		A mechanism is in place for sharing cyber threat intelligence with business units in real time including the potential financial and operational impact of inaction. A system automatically informs management of the level of business risk specific to the institution and the progress of recommended steps taken to mitigate the risks. The institution is leading efforts to create new sector-wide information-sharing channels to address gaps in external-facing information-sharing mechanisms.

Domain 3: Cybersecurity Controls

Assessment Factor: Preventative Controls

		Y, Y(C), N	
INFRASTRUCTURE MANAGEMENT	**Baseline**		Network perimeter defense tools (e.g., border router and firewall) are used. *(FFIEC Information Security Booklet, page 33)* Systems that are accessed from the Internet or by external parties are protected by firewalls or other similar devices. *(FFIEC Information Security Booklet, page 46)* All ports are monitored. *(FFIEC Information Security Booklet, page 50)* Up to date antivirus and anti-malware tools are used. *(FFIEC Information Security Booklet, page 78)* Systems configurations (for servers, desktops, routers, etc.) follow industry standards and are enforced. *(FFIEC Information Security Booklet, page 56)* Ports, functions, protocols and services are prohibited if no longer needed for business purposes. *(FFIEC Information Security Booklet, page 50)* Access to make changes to systems configurations (including virtual machines and hypervisors) is controlled and monitored. *(FFIEC Information Security Booklet, page 56)* Programs that can override system, object, network, virtual machine, and application controls are restricted. *(FFIEC Information Security Booklet, page 41)* System sessions are locked after a pre-defined period of inactivity and are terminated after pre-defined conditions are met. *(FFIEC Information Security Booklet, page 23)* Wireless network environments require security settings with strong encryption for authentication and transmission. (*N/A if there are no wireless networks.) *(FFIEC Information Security Booklet, page 40)*
	Evolving		There is a firewall at each Internet connection and between any Demilitarized Zone (DMZ) and internal network(s). Antivirus and intrusion detection/prevention systems (IDS/IPS) detect and block actual and attempted attacks or intrusions. Technical controls prevent unauthorized devices, including rogue wireless access devices and removable media, from connecting to the internal network(s). A risk-based solution is in place at the institution or Internet hosting

			provider to mitigate disruptive cyber attacks (e.g., DDoS attacks). Guest wireless networks are fully segregated from the internal network(s). (*N/A if there are no wireless networks.) Domain Name System Security Extensions (DNSSEC) is deployed across the enterprise. Critical systems supported by legacy technologies are regularly reviewed to identify for potential vulnerabilities, upgrade opportunities, or new defense layers. Controls for unsupported systems are implemented and tested.
	Intermediate		The enterprise network is segmented in multiple, separate trust/security zones with defense-in-depth strategies (e.g., logical network segmentation, hard backups, air-gapping) to mitigate attacks. Security controls are used for remote access to all administrative consoles, including restricted virtual systems. Wireless network environments have perimeter firewalls that are implemented and configured to restrict unauthorized traffic. (*N/A if there are no wireless networks.) Wireless networks use strong encryption with encryption keys that are changed frequently. (*N/A if there are no wireless networks.) The broadcast range of the wireless network(s) is confined to institution-controlled boundaries. (*N/A if there are no wireless networks.) Technical measures are in place to prevent the execution of unauthorized code on institution owned or managed devices, network infrastructure, and systems components.
	Advanced		Network environments and virtual instances are designed and configured to restrict and monitor traffic between trusted and untrusted zones. Only one primary function is permitted per server to prevent functions that require different security levels from co-existing on the same server. Anti-spoofing measures are in place to detect and block forged source IP addresses from entering the network.
	Innovative		The institution risk scores all of its infrastructure assets and updates in real time based on threats, vulnerabilities, or operational changes. Automated controls are put in place based on risk scores to infrastructure assets, including automatically disconnecting affected assets. The institution proactively seeks to identify control gaps that may be used as part of a zero-day attack.

			Public-facing servers are routinely rotated and restored to a known clean state to limit the window of time a system is exposed to potential threats.
ACCESS AND DATA MANAGEMENT	**Baseline**		Employee access is granted to systems and confidential data based on job responsibilities and the principles of least privilege. *(FFIEC Information Security Booklet, page 19)* Employee access to systems and confidential data provides for separation of duties. *(FFIEC Information Security Booklet, page 19)* Elevated privileges (e.g., administrator privileges) are limited and tightly controlled (e.g., assigned to individuals, not shared, and require stronger password controls). *(FFIEC Information Security Booklet, page 19)* User access reviews are performed periodically for all systems and applications based on the risk to the application or system. *(FFIEC Information Security Booklet, page 18)* Changes to physical and logical user access, including those that result from voluntary and involuntary terminations, are submitted to and approved by appropriate personnel. *(FFIEC Information Security Booklet, page 18)* Identification and authentication are required and managed for access to systems, applications, and hardware. *(FFIEC Information Security Booklet, page 21)* Access controls include password complexity and limits to password attempts and reuse. *(FFIEC Information Security Booklet, page 66)* All default passwords and unnecessary default accounts are changed before system implementation. *(FFIEC Information Security Booklet, page 61)* Customer access to Internet-based products or services requires authentication controls (e.g., layered controls, multifactor) that are commensurate with the risk. *(FFIEC Information Security Booklet, page 21)* Production and non-production environments are segregated to prevent unauthorized access or changes to information assets. (*N/A if no production environment exists at the institution or the institution's third party.) *(FFIEC Information Security Booklet, page 64)* Physical security controls are used to prevent unauthorized access to information systems and telecommunication systems. *(FFIEC Information Security Booklet, page 47)* All passwords are encrypted in storage and in transit. *(FFIEC Information Security Booklet, page 21)*

			Confidential data are encrypted when transmitted across public or untrusted networks (e.g., Internet). *(FFIEC Information Security Booklet, page 51)* Mobile devices (e.g., laptops, tablets, and removable media) are encrypted if used to store confidential data. (*N/A if mobile devices are not used.) *(FFIEC Information Security Booklet, page 51)* Remote access to critical systems by employees, contractors, and third parties uses encrypted connections and multifactor authentication. *(FFIEC Information Security Booklet, page 45)* Administrative, physical, or technical controls are in place to prevent users without administrative responsibilities from installing unauthorized software. *(FFIEC Information Security Booklet, page 25)* Customer service (e.g., the call center) utilizes formal procedures to authenticate customers commensurate with the risk of the transaction or request. *(FFIEC Information Security Booklet, page 19)* Data is disposed of or destroyed according to documented requirements and within expected time frames. *(FFIEC Information Security Booklet, page 66)*
	Evolving		Changes to user access permissions trigger automated notices to appropriate personnel. Administrators have two accounts: one for administrative use and one for general purpose, non-administrative tasks. Use of customer data in non-production environments complies with legal, regulatory, and internal policy requirements for concealing or removing of sensitive data elements. Physical access to high-risk or confidential systems is restricted, logged, and unauthorized access is blocked. Controls are in place to prevent unauthorized access to cryptographic keys.

	Intermediate		The institution has implemented tools to prevent unauthorized access to or exfiltration of confidential data. Controls are in place to prevent unauthorized escalation of user privileges. Access controls are in place for database administrators to prevent unauthorized downloading or transmission of confidential data. All physical and logical access is removed immediately upon notification of involuntary termination and within 24 hours of an employee's voluntary departure. Multifactor authentication and/or layered controls have been implemented to secure all third-party access to the institution's network and/or systems and applications. Multifactor authentication (e.g., tokens, digital certificates) techniques are used for employee access to high-risk systems as identified in the risk assessment(s). (*N/A if no high risk systems.) Confidential data are encrypted in transit across private connections (e.g., frame relay and T1) and within the institution's trusted zones. Controls are in place to prevent unauthorized access to collaborative computing devices and applications (e.g., networked white boards, cameras, microphones, online applications such as instant messaging and document sharing). (* N/A if collaborative computing devices are not used.)
	Advanced		Encryption of select data at rest is determined by the institution's data classification and risk assessment. Customer authentication for high-risk transactions includes methods to prevent malware and man-in-the-middle attacks (e.g., using visual transaction signing).

	Innovative		Adaptive access controls de-provision or isolate an employee, third-party, or customer credentials to minimize potential damage if malicious behavior is suspected. Unstructured confidential data are tracked and secured through an identity-aware, cross-platform storage system that protects against internal threats, monitors user access, and tracks changes. Tokenization is used to substitute unique values for confidential information (e.g., virtual credit card). The institution is leading efforts to create new technologies and processes for managing customer, employee, and third-party authentication and access. Real-time risk mitigation is taken based on automated risk scoring of user credentials.
DEVICE/END-POINT SECURITY	**Baseline**		Controls are in place to restrict the use of removable media to authorized personnel. *(FFIEC Information Security Work Program, Objective I: 4-1)*
	Evolving		Tools automatically block attempted access from unpatched employee and third-party devices. Tools automatically block attempted access by unregistered devices to internal networks. The institution has controls to prevent the unauthorized addition of new connections. Controls are in place to prevent unauthorized individuals from copying confidential data to removable media. Antivirus and anti-malware tools are deployed on end-point devices (e.g., workstations, laptops, and mobile devices). Mobile devices with access to the institution's data are centrally managed for antivirus and patch deployment. (*N/A if mobile devices are not used.) The institution wipes data remotely on mobile devices when a device is missing or stolen. (*N/A if mobile devices are not used.)
	Intermediate		Data loss prevention controls or devices are implemented for inbound and outbound communications (e.g., e-mail, FTP, Telnet, prevention of large file transfers). Mobile device management includes integrity scanning (e.g., jailbreak/rooted detection). (*N/A if mobile devices are not used.) Mobile devices connecting to the corporate network for storing and accessing company information allow for remote software version/patch validation. (*N/A if mobile devices are not used.)

	Advanced		Employees' and third parties' devices (including mobile) without the latest security patches are quarantined and patched before the device is granted access to the network. Confidential data and applications on mobile devices are only accessible via a secure, isolated sandbox or a secure container.
	Innovative		A centralized end-point management tool provides fully integrated patch, configuration, and vulnerability management, while also being able to detect malware upon arrival to prevent an exploit.
SECURE CODING	**Baseline**		Developers working for the institution follow secure program coding practices, as part of a system development life cycle (SDLC), that meet industry standards. *(FFIEC Information Security Booklet, page 56)* The security controls of internally developed software are periodically reviewed and tested. (*N/A if there is no software development.) *(FFIEC Information Security Booklet, page 59)* The security controls in internally developed software code are independently reviewed before migrating the code to production. (*N/A if there is no software development.) *(FFIEC Development and Acquisition Booklet, page 2)* Intellectual property and production code are held in escrow. (*N/A if there is no production code to hold in escrow.) *(FFIEC Development and Acquisition Booklet, page 39)*
	Evolving		Security testing occurs at all post-design phases of the SDLC for all applications, including mobile applications. (*N/A if there is no software development.)
	Intermediate		Processes are in place to mitigate vulnerabilities identified as part of the secure development of systems and applications. The security of applications, including Web-based applications connected to the Internet, is tested against known types of cyber attacks (e.g., SQL injection, cross-site scripting, buffer overflow) before implementation or following significant changes. Software code executables and scripts are digitally signed to confirm the software author and guarantee that the code has not been altered or corrupted. A risk-based, independent information assurance function evaluates the security of internal applications.
	Advanced		Vulnerabilities identified through a static code analysis are remediated before implementing newly developed or changed applications into production. All interdependencies between applications and services have been

			identified. Independent code reviews are completed on internally developed or vendor-provided custom applications to ensure there are no security gaps.
	Innovative		Software code is actively scanned by automated tools in the development environment so that security weaknesses can be resolved immediately during the design phase.
Assessment Factor: Detective Controls			
THREAT AND VULNERABILITY DETECTION	**Baseline**		Independent testing (including penetration testing and vulnerability scanning) is conducted according to the risk assessment for external-facing systems and the internal network. *(FFIEC Information Security Booklet, page 61)* Antivirus and anti-malware tools are used to detect attacks. *(FFIEC Information Security Booklet, page 55)* Firewall rules are audited or verified at least quarterly. *(FFIEC Information Security Booklet, page 82)* E-mail protection mechanisms are used to filter for common cyber threats (e.g., attached malware or malicious links). *(FFIEC Information Security Booklet, page 39)*
	Evolving		Independent penetration testing of network boundary and critical Web-facing applications is performed routinely to identify security control gaps. Independent penetration testing is performed on Internet-facing applications or systems before they are launched or undergo significant change. Antivirus and anti-malware tools are updated automatically. Firewall rules are updated routinely. Vulnerability scanning is conducted and analyzed before deployment/redeployment of new/existing devices. Processes are in place to monitor potential insider activity that could lead to data theft or destruction.
	Intermediate		Audit or risk management resources review the penetration testing scope and results to help determine the need for rotating companies based on the quality of the work. E-mails and attachments are automatically scanned to detect malware and are blocked when malware is present.

	Advanced		Weekly vulnerability scanning is rotated among environments to scan all environments throughout the year. Penetration tests include cyber attack simulations and/or real-world tactics and techniques such as red team testing to detect control gaps in employee behavior, security defenses, policies, and resources. Automated tool(s) proactively identifies high-risk behavior signaling an employee who may pose an insider threat.
	Innovative		User tasks and content (e.g., opening an e-mail attachment) are automatically isolated in a secure container or virtual environment so that malware can be analyzed but cannot access vital data, end-point operating systems, or applications on the institution's network. Vulnerability scanning is performed on a weekly basis across all environments.
ANOMALOUS ACTIVITY DETECTION	**Baseline**		The institution is able to detect anomalous activities through monitoring across the environment. *(FFIEC Information Security Booklet, page 32)* Customer transactions generating anomalous activity alerts are monitored and reviewed. *(FFIEC Wholesale Payments Booklet, page 12)* Logs of physical and/or logical access are reviewed following events. *(FFIEC Information Security Booklet, page 73)* Access to critical systems by third parties is monitored for unauthorized or unusual activity. *(FFIEC Outsourcing Booklet, page 26)* Elevated privileges are monitored. *(FFIEC Information Security Booklet, page 19)*
	Evolving		Systems are in place to detect anomalous behavior automatically during customer, employee, and third-party authentication. Security logs are reviewed regularly. Logs provide traceability for all system access by individual users. Thresholds have been established to determine activity within logs that would warrant management response.

	Intermediate		Online customer transactions are actively monitored for anomalous behavior. Tools to detect unauthorized data mining are used. Tools actively monitor security logs for anomalous behavior and alert within established parameters. Audit logs are backed up to a centralized log server or media that is difficult to alter. Thresholds for security logging are evaluated periodically. Anomalous activity and other network and system alerts are correlated across business units to detect and prevent multifaceted attacks (e.g., simultaneous account takeover and DDoS attack).
	Advanced		An automated tool triggers system and/or fraud alerts when customer logins occur within a short period of time but from physically distant IP locations. External transfers from customer accounts generate alerts and require review and authorization if anomalous behavior is detected. A system is in place to monitor and analyze employee behavior (network use patterns, work hours, and known devices) to alert on anomalous activities. An automated tool(s) is in place to detect and prevent data mining by insider threats. Tags on fictitious confidential data or files are used to provide advanced alerts of potential malicious activity when the data is accessed.
	Innovative		The institution has a mechanism for real-time automated risk scoring of threats. The institution is developing new technologies that will detect potential insider threats and block activity in real time.

EVENT DETECTION			
	Baseline		A normal network activity baseline is established. *(FFIEC Information Security Booklet, page 77)* Mechanisms (e.g., antivirus alerts, log event alerts) are in place to alert management to potential attacks. *(FFIEC Information Security Booklet, page 78)* Processes are in place to monitor for the presence of unauthorized users, devices, connections, and software. *(FFIEC Information Security Work Program, Objective II: M-9)* Responsibilities for monitoring and reporting suspicious systems activity have been assigned. *(FFIEC Information Security Booklet, page 83)* The physical environment is monitored to detect potential unauthorized access. *(FFIEC Information Security Booklet, page 47)*
	Evolving		A process is in place to correlate event information from multiple sources (e.g., network, application, or firewall).
	Intermediate		Controls or tools (e.g., data loss prevention) are in place to detect potential unauthorized or unintentional transmissions of confidential data. Event detection processes are proven reliable. Specialized security monitoring is used for critical assets throughout the infrastructure.
	Advanced		Automated tools detect unauthorized changes to critical system files, firewalls, IPS, IDS, or other security devices. Real-time network monitoring and detection is implemented and incorporates sector-wide event information. Real-time alerts are automatically sent when unauthorized software, hardware, or changes occur. Tools are in place to actively correlate event information from multiple sources and send alerts based on established parameters.
	Innovative		The institution is leading efforts to develop event detection systems that will correlate in real time when events are about to occur. The institution is leading the development effort to design new technologies that will detect potential insider threats and block activity in real time.

Assessment Factor: Corrective Controls			
PATCH MANAGEMENT	**Baseline**		A patch management program is implemented and ensures that software and firmware patches are applied in a timely manner. *(FFIEC Information Security Booklet, page 62)* Patches are tested before being applied to systems and/or software. *(FFIEC Operations Booklet, page 22)* Patch management reports are reviewed and reflect missing security patches. *(FFIEC Development and Acquisition Booklet, page 50)*
	Evolving		A formal process is in place to acquire, test, and deploy software patches based on criticality. Systems are configured to retrieve patches automatically. Operational impact is evaluated before deploying security patches. An automated tool(s) is used to identify missing security patches as well as the number of days since each patch became available. Missing patches across all environments are prioritized and tracked.
	Intermediate		Patches for high-risk vulnerabilities are tested and applied when released or the risk is accepted and accountability assigned.
	Advanced		Patch monitoring software is installed on all servers to identify any missing patches for the operating system software, middleware, database, and other key software. The institution monitors patch management reports to ensure security patches are tested and implemented within aggressive time frames (e.g., 0-30 days).
	Innovative		The institution develops security patches or bug fixes or contributes to open source code development for systems it uses. Segregated or separate systems are in place that mirror production systems allowing for rapid testing and implementation of patches and provide for rapid fallback when needed.

REMEDIATION			
	Baseline		Issues identified in assessments are prioritized and resolved based on criticality and within the time frames established in the response to the assessment report. *(FFIEC Information Security Booklet, page 87)*
	Evolving		Data is destroyed or wiped on hardware and portable/mobile media when a device is missing, stolen, or no longer needed. Formal processes are in place to resolve weaknesses identified during penetration testing.
	Intermediate		Remediation efforts are confirmed by conducting a follow-up vulnerability scan. Penetration testing is repeated to confirm that medium- and high-risk, exploitable vulnerabilities have been resolved. Security investigations, forensic analysis, and remediation are performed by qualified staff or third parties. Generally accepted and appropriate forensic procedures, including chain of custody, are used to gather and present evidence to support potential legal action. The maintenance and repair of organizational assets are performed by authorized individuals with approved and controlled tools. The maintenance and repair of organizational assets are logged in a timely manner.
	Advanced		All medium and high risk issues identified in penetration testing, vulnerability scanning, and other independent testing are escalated to the board or an appropriate board committee for risk acceptance if not resolved in a timely manner.
	Innovative		The institution is developing technologies that will remediate systems damaged by zero-day attacks to maintain current recovery time objectives.

Domain 4: External Dependency Management			
Assessment Factor: Connections			
		Y, Y(C), N	
CONNECTIONS	**Baseline**		The critical business processes that are dependent on external connectivity have been identified. *(FFIEC Information Security Booklet, page 9)* The institution ensures that third-party connections are authorized. *(FFIEC Information Security Booklet, page 17)* A network diagram is in place and identifies all external connections. *(FFIEC Information Security Booklet, page 9)* Data flow diagrams are in place and document information flow to external parties. *(FFIEC Information Security Booklet, page 10)*
	Evolving		Critical business processes have been mapped to the supporting external connections. The network diagram is updated when connections with third parties change or at least annually. Network and systems diagrams are stored in a secure manner with proper restrictions on access. Controls for primary and backup third-party connections are monitored and tested on a regular basis.
	Intermediate		A validated asset inventory is used to create comprehensive diagrams depicting data repositories, data flow, infrastructure, and connectivity. Security controls are designed and verified to detect and prevent intrusions from third-party connections. Monitoring controls cover all external connections (e.g., third-party service providers, business partners, customers). Monitoring controls cover all internal network-to-network connections.
	Advanced		The security architecture is validated and documented before network connection infrastructure changes. The institution works closely with third-party service providers to maintain and improve the security of external connections.

	Innovative		Diagram(s) of external connections is interactive, shows real-time changes to the network connection infrastructure, new connections, and volume fluctuations, and alerts when risks arise. The institution's connections can be segmented or severed instantaneously to prevent contagion from cyber attacks.
Assessment Factor: Relationship Management			
DUE DILIGENCE	**Baseline**		Risk-based due diligence is performed on prospective third parties before contracts are signed, including reviews of their background, reputation, financial condition, stability, and security controls. *(FFIEC Information Security Booklet, page 69)* A list of third-party service providers is maintained. *(FFIEC Outsourcing Booklet, page 19)* A risk assessment is conducted to identify criticality of service providers. *(FFIEC Outsourcing Booklet, page 6)*
	Evolving		A formal process exists to analyze assessments of third-party cybersecurity controls. The board or an appropriate board committee reviews a summary of due diligence results including management's recommendations to use third parties that will affect the institution's inherent risk profile.
	Intermediate		A process is in place to confirm that the institution's third-party service providers conduct due diligence of their third parties (e.g., subcontractors). Pre-contract, physical site visits of high-risk vendors are conducted by the institution or by a qualified third party.
	Advanced		A continuous process improvement program is in place for third-party due diligence activity. Audits of high-risk vendors are conducted on an annual basis.
	Innovative		The institution promotes sector-wide efforts to build due diligence mechanisms that lead to in-depth and efficient security and resilience reviews. The institution is leading efforts to develop new auditable processes and for conducting due diligence and ongoing monitoring of cybersecurity risks posed by third parties.

CONTRACTS			
	Baseline		Formal contracts that address relevant security and privacy requirements are in place for all third parties that process, store, or transmit confidential data or provide critical services. *(FFIEC Information Security Booklet, page 7)* Contracts acknowledge that the third party is responsible for the security of the institution's confidential data that it possesses, stores, processes, or transmits. *(FFIEC Information Security Booklet, page 12)* Contracts stipulate that the third-party security controls are regularly reviewed and validated by an independent party. *(FFIEC Information Security Booklet, page 12)* Contracts identify the recourse available to the institution should the third party fail to meet defined security requirements. *(FFIEC Outsourcing Booklet, page 12)* Contracts establish responsibilities for responding to security incidents. *(FFIEC E-Banking Booklet, page 22)* Contracts specify the security requirements for the return or destruction of data upon contract termination. *(FFIEC Outsourcing Booklet, page 15)*
	Evolving		Responsibilities for managing devices (e.g., firewalls, routers) that secure connections with third parties are formally documented in the contract. Responsibility for notification of direct and indirect security incidents and vulnerabilities is documented in contracts or service-level agreements (SLAs). Contracts stipulate geographic limits on where data can be stored or transmitted.
	Intermediate		Third-party SLAs or similar means are in place that require timely notification of security events.
	Advanced		Contracts require third-party service provider's security policies meet or exceed those of the institution. A third-party termination/exit strategy has been established and validated with management.
	Innovative		The institution promotes a sector-wide effort to influence contractual requirements for critical third parties to the industry.

ONGOING MONITORING	**Baseline**		The third-party risk assessment is updated regularly. *(FFIEC Outsourcing Booklet, page 3)* Audits, assessments, and operational performance reports are obtained and reviewed regularly validating security controls for critical third parties. *(FFIEC Information Security Booklet, page 86)* Ongoing monitoring practices include reviewing critical third-parties' resilience plans. *(FFIEC Outsourcing Booklet, page 19)*
	Evolving		A process to identify new third-party relationships is in place, including identifying new relationships that were established without formal approval. A formal program assigns responsibility for ongoing oversight of third-party access. Monitoring of third parties is scaled, in terms of depth and frequency, according to the risk of the third parties. Automated reminders or ticklers are in place to identify when required third-party information needs to be obtained or analyzed.
	Intermediate		Third-party employee access to the institution's confidential data are tracked actively based on the principles of least privilege. Periodic on-site assessments of high-risk vendors are conducted to ensure appropriate security controls are in place.
	Advanced		Third-party employee access to confidential data on third-party hosted systems is tracked actively via automated reports and alerts.
	Innovative		The institution is leading efforts to develop new auditable processes for ongoing monitoring of cybersecurity risks posed by third parties.

Domain 5: Cyber Incident Management and Resilience			
Assessment Factor: Incident Resilience Planning and Strategy			
		Y, Y(C), N	
PLANNING	**Baseline**		The institution has documented how it will react and respond to cyber incidents. *(FFIEC Business Continuity Planning Booklet, page 4)* Communication channels exist to provide employees a means for reporting information security events in a timely manner. *(FFIEC Information Security Booklet, page 83)* Roles and responsibilities for incident response team members are defined. *(FFIEC Information Security Booklet, page 84)* The response team includes individuals with a wide range of backgrounds and expertise, from many different areas within the institution (e.g., management, legal, public relations, as well as information technology). *(FFIEC Information Security Booklet, page 84)* A formal backup and recovery plan exists for all critical business lines. *(FFIEC Business Continuity Planning Booklet, page 4)* The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident. *(FFIEC Information Security Booklet, page 71)*
	Evolving		The remediation plan and process outlines the mitigating actions, resources, and time parameters. The corporate disaster recovery, business continuity, and crisis management plans have integrated consideration of cyber incidents. Alternative processes have been established to continue critical activity within a reasonable time period. Business impact analyses have been updated to include cybersecurity. Due diligence has been performed on technical sources, consultants, or forensic service firms that could be called to assist the institution during or following an incident.

	Intermediate		A strategy is in place to coordinate and communicate with internal and external stakeholders during or following a cyber attack. Plans are in place to re-route or substitute critical functions and/or services that may be affected by a successful attack on Internet-facing systems. A direct cooperative or contractual agreement(s) is in place with an incident response organization(s) or provider(s) to assist rapidly with mitigation efforts. Lessons learned from real-life cyber incidents and attacks on the institution and other organizations are used to improve the institution's risk mitigation capabilities and response plan.
	Advanced		Methods for responding to and recovering from cyber incidents are tightly woven throughout the business units' disaster recovery, business continuity, and crisis management plans. Multiple systems, programs, or processes are implemented into a comprehensive cyber resilience program to sustain, minimize, and recover operations from an array of potentially disruptive and destructive cyber incidents. A process is in place to continuously improve the resilience plan.
	Innovative		The incident response plan is designed to ensure recovery from disruption of services, assurance of data integrity, and recovery of lost or corrupted data following a cybersecurity incident. The incident response process includes detailed actions and rule-based triggers for automated response.
TESTING	**Baseline**		Scenarios are used to improve incident detection and response. *(FFIEC Information Security Booklet, page 71)* Business continuity testing involves collaboration with critical third parties. *(FFIEC Business Continuity Planning Booklet, page J-6)* Systems, applications, and data recovery is tested at least annually. *(FFIEC Business Continuity Planning Booklet, page J-7)*
	Evolving		Recovery scenarios include plans to recover from data destruction and impacts to data integrity, data loss, and system and data availability. Widely reported events are used to evaluate and improve the institution's response. Information backups are tested periodically to verify they are accessible and readable.

	Intermediate		Cyber-attack scenarios are analyzed to determine potential impact to critical business processes. The institution participates in sector-specific cyber exercises or scenarios (e.g., FS-ISAC Cyber Attack (against) Payment Processors (CAPP)). Resilience testing is based on analysis and identification of realistic and highly likely threats as well as new and emerging threats facing the institution. The critical online systems and processes are tested to withstand stresses for extended periods (e.g., DDoS). The results of cyber event exercises are used to improve the incident response plan and automated triggers.
	Advanced		Resilience testing is comprehensive and coordinated across all critical business functions. The institution validates that it is able to recover from cyber events similar to by known sophisticated attacks at other organizations. Incident response testing evaluates the institution from an attacker's perspective to determine how the institution or its assets at critical third parties may be targeted. The institution corrects root causes for problems discovered during cybersecurity resilience testing. Cybersecurity incident scenarios involving significant financial loss are used to stress test the institution's risk management.
	Innovative		The institution tests the ability to shift business processes or functions between different processing centers or technology systems for cyber incidents without interruption to business or loss of productivity or data. The institution has validated that it is able to remediate systems damaged by zero-day attacks to maintain current recovery time objectives. The institution is leading the development of more realistic test environments. Cyber incident scenarios are used to stress test potential financial losses across the sector.

Assessment Factor: Detection, Response, and Mitigation			
DETECTION	**Baseline**		Alert parameters are set for detecting information security incidents that prompt mitigating actions. *(FFIEC Information Security Booklet, page 43)* System performance reports contain information that can be used as a risk indicator to detect information security incidents. *(FFIEC Information Security Booklet, page 86)* Tools and processes are in place to detect, alert, and trigger the incident response program. *(FFIEC Information Security Booklet, page 84)*
	Evolving		The institution has processes to detect and alert the incident response team when potential insider activity manifests that could lead to data theft or destruction.
	Intermediate		The incident response program is triggered when anomalous behaviors and attack patterns or signatures are detected. The institution has the ability to discover infiltration, before the attacker traverses across systems, establishes a foothold, steals information, or causes damage to data and systems. Incidents are detected in real time through automated processes that include instant alerts to appropriate personnel who can respond. Network and system alerts are correlated across business units to better detect and prevent multifaceted attacks (e.g., simultaneous DDoS attack and account takeover). Incident detection processes are capable of correlating events across the enterprise.
	Advanced		Sophisticated and adaptive technologies are deployed that can detect and alert the incident response team of specific tasks when threat indicators across the enterprise indicate potential external and internal threats. Automated tools are implemented to provide specialized security monitoring based on the risk of the assets to detect and alert incident response teams in real time.
	Innovative		The institution is able to detect and block zero-day attempts and inform management and the incident response team in real time.

RESPONSE AND MITIGATION			
	Baseline		Appropriate steps are taken to contain and control an incident to prevent further unauthorized access to or use of customer information. *(FFIEC Information Security Booklet, page 84)*
	Evolving		The incident response plan is designed to prioritize incidents, enabling a rapid response for significant cybersecurity incidents or vulnerabilities. A process is in place to help contain incidents and restore operations with minimal service disruption. Containment and mitigation strategies are developed for multiple incident types (e.g., DDoS, malware). Procedures include containment strategies and notifying potentially impacted third parties. Processes are in place to trigger the incident response program when an incident occurs at a third party. Records are generated to support incident investigation and mitigation. The institution calls upon third parties, as needed, to provide mitigation services. Analysis of events is used to improve the institution's security measures and policies.
	Intermediate		Analysis of security incidents is performed in the early stages of an intrusion to minimize the impact of the incident. Any changes to systems/applications or to access entitlements necessary for incident management are reviewed by management for formal approval before implementation. Processes are in place to ensure assets affected by a security incident that cannot be returned to operational status are quarantined, removed, disposed of, and/or replaced. Processes are in place to ensure that restored assets are appropriately reconfigured and thoroughly tested before being placed back into operation.
	Advanced		The incident management function collaborates effectively with the cyber threat intelligence function during an incident. Links between threat intelligence, network operations, and incident response allow for proactive response to potential incidents. Technical measures apply defense-in-depth techniques such as deep-packet inspection and black holing for detection and timely response to network-based attacks associated with anomalous ingress or egress traffic patterns and/or DDoS attacks.

	Innovative		The institution's risk management of significant cyber incidents results in limited to no disruptions to critical services. The technology infrastructure has been engineered to limit the effects of a cyber attack on the production environment from migrating to the backup environment (e.g., air-gapped environment and processes).
Assessment Factor: Escalation and Reporting			
ESCALATION AND REPORTING	**Baseline**		A process exists to contact personnel who are responsible for analyzing and responding to an incident. *(FFIEC Information Security Booklet, page 83)* Procedures exist to notify customers, regulators, and law enforcement as required or necessary when the institution becomes aware of an incident involving the unauthorized access to or use of sensitive customer information. *(FFIEC Information Security Booklet, page 84)* The institution prepares an annual report of security incidents or violations for the board or an appropriate board committee. *(FFIEC Information Security Booklet, page 5)* Incidents are classified, logged, and tracked. *(FFIEC Operations Booklet, page 28)*
	Evolving		Criteria have been established for escalating cyber incidents or vulnerabilities to the board and senior management based on the potential impact and criticality of the risk. Regulators, law enforcement, and service providers, as appropriate, are notified when the institution is aware of any unauthorized access to systems or a cyber incident occurs that could result in degradation of services. Tracked cyber incidents are correlated for trend analysis and reporting.
	Intermediate		Employees that are essential to mitigate the risk (e.g., fraud, business resilience) know their role in incident escalation. A communication plan is used to notify other organizations, including third parties, of incidents that may affect them or their customers. An external communication plan is used for notifying media regarding incidents when applicable.
	Advanced		The institution has established quantitative and qualitative metrics for the cybersecurity incident response process. Detailed metrics, dashboards, and/or scorecards outlining cyber incidents and events are provided to management and are part of the board meeting package.

	Innovative		A mechanism is in place to provide instantaneous notification of incidents to management and essential employees through multiple communication channels with tracking and verification of receipt.

Florida Office of Financial Regulation

Administrative Policies & Procedures

TITLE:	**Ethics and Professional Responsibility**
NUMBER:	**OFR AP&P 1-2**[1]
EFFECTIVE DATE:	**May 30, 2013**
REVISED DATE:	**May 2, 2018**
REISSUE DATE:	**May 29, 2019**
APPROVED BY:	**Chief of Staff**

I. PURPOSE

The Office of Financial Regulation (OFR) is committed to building public trust and confidence in the State's financial services industry. To do so, the industry's regulators must work in an ethical, professional, and open manner.

The OFR adopts and follows the Department of Financial Services (DFS): AP&P 1-15, Department of Financial Services Code of Ethics. References to "department" in DFS AP&P 1-15 shall include OFR unless otherwise specified in this memorandum. This memorandum details additional ethical guidelines, procedures and principles that are required of all OFR staff.

OFR has adopted an "appearance of impropriety" standard for evaluating employee conduct. This standard applies to both professional and personal conduct. For purposes of this document, the phrase "appearance of impropriety" means conduct that would create in reasonable minds a perception that the employee's ability to carry out the duties and responsibilities of the OFR with integrity, impartiality and competence is impaired. In some cases, this may result in a stricter standard than imposed by DFS AP&P 1-15. In the event there is a conflict between DFS AP&P 1-15 and this memorandum, the OFR standard shall apply.

It is essential that all employees of OFR conduct themselves in an ethical and professional manner to effectively regulate and maintain the trust of the regulated industries.

[1] Previously titled OFR Guideline Memo – 006

II. SCOPE

This memorandum is applicable to all Office of Financial Regulation staff.

III. REFERENCES

A. Department of Financial Services (DFS): AP&P 1-15, Department of Financial Services Code of Ethics
B. Florida Statutes: Chapter 112, Part III
C. Florida Administrative Code: Rule 60L-36.003
D. Florida Administrative Code: Rule 69U-100.956

IV. DEFINITIONS

A. Annual Statement of Independence, Form OFR-AA-02 - completed annually by all employees of the OFR to report his or her business relationships with OFR regulated entities.
B. Immediate Family Member as used in Annual Statement of Independence, Form OFR-AA-02, means a parent, sibling, spouse, child, or person who is engaged to be married to the employee or who otherwise holds himself or herself out as or is generally known as the person with whom the employee intends to form a household.
C. Lobbying - influencing or attempting to influence legislative action or nonaction through oral or written communication or an attempt to obtain the goodwill of a member or employee of the Legislature.
D. OFR Ethics Officer - the General Counsel of the OFR.
E. Personal Interest as used in Annual Statement of Independence, Form OFR-AA-02, means having a business relationship with a person or entity. Examples of personal interests include but are not limited to: being an owner or co-owner of a business, having an account or joint-account, loan or co-signer on a loan, and ownership or joint ownership of a credit card or line of credit with a business.
F. Recuse - to disqualify or remove oneself from participation in an action.

V. GENERAL GUIDELINES AND PROCEDURES

A. Prohibited Practices
   1. No OFR employee may accept or solicit any gift from a business or person regulated by OFR, DFS, or the Office of Insurance Regulation (OIR), regardless of value.
   2. No OFR employee may hold an active license or registration issued by OFR, DFS, or OIR.
   3. OFR employees may not lobby the legislature on behalf of OFR unless they are designated by OFR to do so and registered with the Lobbyist Registration Office. The following positions are designated to lobby on behalf of OFR: Commissioner, Chief of

Staff, Director of Communications, Legislative Affairs Director, General Counsel, and the Budget Director.

B. Ethics Officer
1. Ensure that OFR employees are familiar with applicable ethics rules.
2. Advise OFR employees on questions of ethics and professional responsibility.

C. Employee Responsibility
1. Comply with the DFS Code of Ethics and the OFR Ethics and Professional Responsibilities policies.
2. Sign the Employee Pledge upon employment.
3. Complete and submit an Annual Statement of Independence, Form OFR-AA-02 within five (5) working days of employment.
4. Complete an Annual Statement of Independence, Form OFR-AA-02, before July 1 each year.
    - Tallahassee staff shall submit original, signed forms directly to their Division Director.
    - Field staff shall submit original signed forms to the Area Financial Manager, who will forward them to the Division Director.
5. Notify their supervisor and submit an Interim Notification on Form OFR-AA-02 within five (5) working days of the change or learning of a previously unknown relationship.
6. Recuse themselves from any direct regulation, examination, investigation, legal casework, or licensing review of entities disclosed on the Annual Statement of Independence:
    - Licensing staff are not required to recuse themselves from processing applications for individuals employed by an entity listed on the Annual Statement of Independence unless the review involves matters requiring a subjective decision and the employee is involved in the decision-making process.
    - Recusal should be accomplished by contacting the supervisor and notifying them in writing of the relationship.
7. Complete Ethics Training upon onboarding and thereafter, on a biennial basis.
8. Report all suspected workplace ethical violations to the OFR Inspector General.
9. Read and comply with Florida Administrative Code: Rule 69U-100.956, for employees within the Division of Financial Institutions.

D. Management Responsibility
1. Comply with the guidelines above.
2. Ensure employees under their supervision sign the Employee Pledge.

3. Ensure employees under their supervision sign an Annual Statement of Independence. Area Financial Managers shall maintain copies of the statements and interim notifications of employees in their geographic area. The Division Director shall maintain all original statements and interim notifications. **NOTE:** The record retention schedule for the Annual Statement of Independence requires retention for ten (10) fiscal years from the date filed with agency. See OFR Individual Retention Schedule (000181-0001a).
4. Ensure that employees do not perform any direct regulation, examination, investigation, legal casework, or licensing review of entities disclosed on their Annual Statement of Independence except as allowed in this policy.
5. Ensure employees complete Ethics Training upon onboarding and thereafter, on a biennial basis.

E. Conflict of Interest – Solicitations or Offers of Employment

1. If an employee applies for or is offered any relationship with an entity regulated by or doing business with OFR, DFS, or OIR, the employee shall notify his or her supervisor within three (3) days of application or receipt of the job offer.
2. Following the submission of an application or an offer of employment from an entity regulated by or doing business with the OFR, DFS, or OIR, the OFR may assess the risk associated with the employee's intended relationship with the entity. If the objectivity of the employee is deemed to be impaired due to the submission of an application for employment or receipt of an offer of employment, the employee shall be reassigned and not permitted to continue to maintain access to information available through the OFR.
3. It remains the responsibility of the employee to avoid any conduct that would violate the DFS Code of Ethics or this policy.

F. Disclosure of Financial Interests

Specified management level employees are required to annually file a Statement of Financial Interests, Form 1, as required by the Florida Commission on Ethics (FCE). Employees required to file a Form 1 with the FCE will do so in a timely manner. Employees who are required to file a Form 1 will be notified by DFS Human Resources.

I. TITLE:

Department of Financial Services Code of Ethics

II. AUTHORITY AND REFERENCES:

Florida Statutes: Chapter 112. Part III
Florida Administrative Code: Chapters 60L-36.003

III. PURPOSE:

All employees of the Department of Financial Services must adhere to the highest ethical standards. Acting ethically requires employees to do more than comply with the law. The Department of Financial Services (the "Department") recognizes the importance of maintaining the highest ethical standards among its employees. The public expects its government officials to conduct the State's business in an ethical, honest, and open manner. Employees are expected to know and comply with the Department's Code of Ethics in addition to all state laws regarding ethics, including the statutory Code of Ethics found in Chapter 112, Part III, Florida Statutes, and the provisions in the Rule Chapter 60L-36.003, Florida Administrative Code.

IV. DEFINITIONS:

A. "Business entity" means any corporation, partnership, limited partnership, proprietorship, firm, enterprise, franchise, association, self-employed individual, or trust, whether fictitiously named or not, doing business in this state.

B. "Commission" means the Commission on Ethics created by Section 112.320, Florida Statutes, or any successor to which its duties are transferred.

C. "Committee of Continuous Existence" means any group, organization, association, or other such entity which is certified pursuant to the provisions of Section 106.04, Florida Statutes, in making contributions to candidates, political committees, or political parties.

D. "Conflict" or "conflict of interest" means a situation in which regard for a private interest tends to lead to disregard of a public duty or interest.

E. "Department" means the Department of Financial Services.

F. “Ethics Officer” means the General Counsel to the Chief Financial Officer (CFO) and is appointed to consult with Department employees on questions of ethics and compliance with the provisions of this policy.

G. “Gift” means anything accepted by a person or on that person’s behalf, whether directly or indirectly, for that person’s benefit, and for which no payment is made in advance. A “gift” can include the following:

1. Real property.

2. The use of real property.

3. Tangible or intangible personal property.

4. The use of tangible or intangible personal property.

5. A preferential rate or terms on a debt, loan, goods, or services, which rate is below the customary rate and is not either a government rate available to all other similarly situated government employees or officials or a rate which is available to similarly situated members of the public by virtue of occupation, affiliation, age, religion, sex, or national origin.

6. Forgiveness of indebtedness.

7. Transportation, other than that provided to a public officer or employee by an agency in relation to officially approved governmental business, lodging, or parking.

8. Food or beverage.

9. Membership dues.

10. Entrance fees, admission fees, or tickets to events, performances, or facilities.

11. Plants, flowers, or floral arrangements.

12. Services provided by persons pursuant to a professional license or certificate.

13. Other personal services for which a fee is normally charged by the person providing the services.

14. Any other similar service or thing having an attributable value not already provided for in this section.

H. "Lobbyist" means any person who, for salary, fee, or other compensation, seeks, or sought during the preceding 12 months, to influence the governmental decision-making of a reporting individual or procurement employee or his or her agency or seeks, or sought during the preceding 12 months, to encourage the passage, defeat, or modification of any proposal or recommendation by the reporting individual or procurement employee or his or her agency.

I. "Political Committee" means any two or more individuals, or a person other than an individual, that, in an aggregate amount in excess of $500 during a single calendar year:

1. accepts contributions for the purposes of making contributions to any candidate, political committee, committee of continuous existence, or political party;

2. accepts contributions for the purpose of expressly advocating the election or defeat of a candidate or the passage or defeat of an issue;

3. makes expenditures that expressly advocate the election or defeat of a candidate or the passage or defeat of an issue; or

4. makes contributions to a common fund, other than a joint checking account between spouses, from which contributions are made to any candidate, political committee, committee of continuous existence, or political party.

J. "Relative" means an individual who is related to a public officer or employee as father, mother, son, daughter, brother, sister, uncle, aunt, first cousin, nephew, niece, husband, wife, father-in-law, mother-in-law, son-in-law, daughter-in-law, brother-in-law, sister-in-law, stepfather, stepmother, stepson, stepdaughter, stepbrother, stepsister, half brother, half sister, grandparent, great grandparent, grandchild, great grandchild, step grandparent, step great grandparent, step grandchild, step great grandchild, person who is engaged to be married to the public officer or employee or who otherwise holds himself out as or is generally known as the person whom the public officer or employee intends to form a household, or any other natural person having the same legal residence as the public officer or employee.

K. “State Building” means any building owned or leased by the state in which state business is conducted.

V. ETHICAL GUIDELINES:

A. General Principles

1. Every employee of the Department is expected to treat colleagues and members of the public with courtesy and respect.

2. Department employees shall ensure that all disclosures made in accordance with the Code of Ethics laws are truthful, fair and accurate. Employees shall record information honestly, completely and accurately.

B. Conflict of Interest

1. A Department employee shall not maintain a personal or financial interest in a matter pending before the Department. Circumstances that do not constitute a conflict of interest are limited to:
   (a) An employee seeking a license of some type with the Department.
   (b) An employee who has filed a consumer complaint with the Department.
   (c) An employee who has filed a claim for unclaimed property.

2. An employee shall, within twenty-four (24) hours of knowledge of a matter, notify his or her supervisor if an employee’s relative, or a business in which the employee’s relative retains a financial interest, has regulatory or contractual business pending before the Department. Circumstances that do not constitute a conflict of interest are limited to:
   (a) A relative seeking a license of some type with the Department.
   (b) A relative who has filed a consumer complaint with the Department.
   (c) A relative who has filed a claim for unclaimed property.

3. A Department employee shall not maintain employment or a contractual relationship with any business entity or any agency which is regulated by the Department, or is doing business with the Department, except that the employee may purchase goods or services from a business entity which is subject to the

regulation of the Department if the price and terms of the transaction are available to members of the general public.

4. A Department employee shall not maintain any employment or contractual relationship that will create a conflict between the employee's private interests and the performance of his or her public duties.

5. If a Department employee applies for or is offered employment, the employee shall within three (3) days notify his or her supervisor of the employment application or job offer. If a Department employee is seeking or upon an entity offering any contractual relationship with an entity regulated by or doing business with the Department, the employee shall, prior to the seeking of the contractual relationship, or within three (3) days upon an entity offering the contractual relationship, notify his or her supervisor.

C. Abuse of Position of Public Trust

1. Department employees shall not use their official position, or the powers of their office, to benefit their own personal interests. This provision will be interpreted broadly to ensure that employees will not abuse the powers of their office for their own personal interests or gain. Examples of prohibited conduct are:

a. Accepting a discount on goods or services (not provided to the general public) from a vendor doing business with the Department.
b. Using a Department vehicle for personal purposes, except as may be permitted for law enforcement personnel.
c. Asking a vendor or contractor doing business with the Department to hire an employee's spouse, child, or other family member.
d. Using Department facilities, equipment, resources for political campaigns, or other political purposes.

D. Charitable Fundraising

1. The Department encourages employees to volunteer their personal time and resources to benefit not-for-profit charities and organizations. Department employees shall not solicit contributions to charitable entities from individuals or entities which are regulated by or do business with the Department. Such fundraising would be a violation of Section C of this Code of Ethics. Department employees may participate in the Florida State Employees Charitable Campaign

(FSECC) during normal business hours to the extent authorized by the CFO. Pursuant to Section 110.181 (1) (a), F.S., FSECC is the only authorized charitable fundraising drive directed toward state employees within work areas during work hours. Division Directors, in consultation with the Ethics Officer, must approve solicitations related to charitable fundraising in the workplace.

E. Political Campaigns and Fundraising

1. Department employees have the right to participate in political campaigns during their personal time. Employees who participate in political campaigns or political activities during normal business hours should do so only when they have received prior approval to take annual leave. Employees are permitted to express their opinions on political subjects and candidates, take an active part in political campaigns outside of working hours, including the wearing of badges or buttons, and displaying bumper stickers and posters.

2. A Department employee who qualifies as a political candidate must notify the Chief of Human Resource Management and his immediate supervisor of his or her candidacy within three (3) days upon qualification.

3. No employee is permitted to make, solicit, or accept contributions for any political campaign in a state building. If a person attempts to deliver a contribution in a state building, the contribution should be refused and the person tendering the contribution should be informed that it is illegal to accept a contribution in a state building. The employee should also notify the Inspector General of the incident. Contributions received by mail at a state building must be returned to the sender.

F. Disclosure of Information Exempt from Public Release

1. Department employees may be privy to information which is exempt from public disclosure under Florida's public records law. Employees are prohibited from disclosing this information or using it for their own personal benefit.

G. Restrictions Upon Leaving the Department

1. A Senior Management Service (SMS) or Selected Exempt Service (SES) employee cannot personally represent another person or entity for compensation

before the Department for a period of two (2) years following termination or retirement.

2. A former employee is prohibited from having any employment or contractual relationship for two (2) years with any business entity (other than a public agency) in connection with a contract for services which was within his or her responsibility while serving as a Department employee.

H. Restrictions Regarding Relatives

1. Employees with knowledge of applicants who possess characteristics particularly suitable to vacancies in the Department should feel welcome to refer those applicants to the Chief of Human Resource Management. However, employees are prohibited from influencing the hiring of relatives for positions within the Department by directly contacting the hiring manager. Anytime an employee recommends a relative for a position within the Department, the employee should first consult with the Department's Ethics Officer prior to making the recommendation.

2. An employee may not appoint, employ, promote, or advance for appointment, employment, promotion, or advancement, in or to a position, over which the employee exercises jurisdiction or control, any individual who is a relative of the employee.

3. Employees shall not procure contractual services for the Department from a business in which a relative is an officer, partner, director or owner.

I. Disclosure Requirements

1. Florida law requires certain employees to file a full and public disclosure of their financial interests with the Florida Commission on Ethics. This disclosure is designed to assure the public that employees' decisions are made impartially and in the public interest, and not for personal gain. Employees shall review and follow the applicable financial disclosure requirements found in Section 112.3145, Florida Statutes.

J. The Receipt and Reporting of Gifts

1. The gift restrictions in this Code apply broadly to all Department employees.

2. An employee is prohibited from soliciting any gift from a political committee or committee of continuous existence, from a vendor doing business with the employee's agency, from a lobbyist who lobbies the Department, from the partner, firm, employer or principal of such lobbyist, or from a person or entity doing business with the Department.

3. An employee is prohibited from accepting any gift, directly or indirectly, from a political committee or committee of continuous existence, from a vendor doing business with the employee's agency, from a lobbyist who lobbies the Department, from the partner, firm, employer, or principal of such lobbyist, or from a person or entity doing business with the Department, unless the following limited exceptions apply:

   (a) Gifts can be accepted from relatives, unless the relative is a lobbyist or a principal of a lobbyist, in which case the general prohibition on receipt of gifts from lobbyists applies. Employees who are married to or involved in a personal relationship with a lobbyist or the principal of a lobbyist shall consult with the Department's Ethics Officer on how to address this situation.

   (b) Gifts can be accepted from personal friends in the ordinary course of friendship, provided that the personal friend is not:

      (i) a lobbyist; or
      (ii) a partner, firm, member, employer, employee or principal of a lobbyist; or
      (iii) a person having a regulatory or contractual interest (either individually or through a corporation or organization) in a matter pending before the Department; or
      (iv) a person who (either individually or through a corporation or organization) provides goods or services to the Department under contract or agreement; or
      (v) a person (either individually or through a corporation or organization) seeking such business from the Department.

   (c) On-site consumption of food or refreshment at receptions and/or other events (even if valued at over $25.00) is permissible provided that the employee's attendance at such event is an appropriate exercise of the employee's official duties. The consumption of food or refreshment at such events, that is provided by or paid for by a lobbyist, principal of a lobbyist, a vendor doing business or seeking to do business with the Department, or an entity regulated by the Department is prohibited. However, if the reception and/or event is part of a sponsored conference, meeting, or other function for which the Department has paid a registration fee or cost for the employee's attendance, and the registration fee or cost includes food or refreshment as part of the printed agenda or other registration materials, the food or refreshment is not a gift and is therefore allowable for on-site consumption.

4. If an employee receives an unsolicited gift which is prohibited under this Code of Ethics, the employee should notify his supervisor and return the gift to the sender. If an employee receives a perishable gift, such as a fruit basket, the employee should donate the gift to a charitable organization. The employee should then write the donor and explain that while appreciated, Department employees are prohibited from receiving gifts under this Code of Ethics.

5. An employee is prohibited from soliciting or knowingly accepting an honorarium from a political committee or committee of continuous existence, from a vendor doing business with the employee's agency, from a lobbyist who lobbies the employee's agency, or from the employer, principal, partner, or firm of such a lobbyist.

K. If an employee has any questions regarding this Code of Ethics, or needs practical advice regarding the ethics of a particular situation, the Ethics Officer to the Department is available to discuss these concerns.

Title 31: Money and Finance: Treasury
PART 561—IRANIAN FINANCIAL SANCTIONS REGULATIONS

Subpart B—Prohibitions

Contents

Back to Top

§561.201 CISADA-based sanctions on certain foreign financial institutions.

Upon a finding by the Secretary of the Treasury that a foreign financial institution knowingly engages in one or more of the activities described in paragraphs (a)(1) through (a)(6) of this section, attempts or conspires to facilitate or participate in one or more of such activities, or is owned or controlled by a foreign financial institution that the Secretary finds knowingly engages in one or more of such activities, consistent with the Secretary of the Treasury's authorities under the Comprehensive Iran Sanctions, Accountability, and Divestment Act of 2010 (Pub. L. 111-195) (22 U.S.C. 8501-8551) ("CISADA"), as amended by the Iran Threat Reduction and Syria Human Rights Act of 2012 (Pub. L. 112-158), either the Secretary of the Treasury will impose one or more strict conditions, as set forth in paragraph (b) of this section, on the opening or maintaining of a correspondent account or a payable-through account in the United States for that foreign financial institution, or, as set forth in paragraph (c) of this section, the Secretary of the Treasury will prohibit a U.S. financial institution from opening or maintaining a correspondent account or a payable-through account in the United States for that foreign financial institution. The name of the foreign financial institution and the relevant prohibition or strict condition(s) will be added to the List of Foreign Financial Institutions Subject to Correspondent Account or Payable-Through Account Sanctions (CAPTA List) on the Office of Foreign Assets Control's Web site (*www.treasury.gov/ofac*) and published in the FEDERAL REGISTER.

(a) A foreign financial institution engages in an activity described in this paragraph if, in any location or currency, the foreign financial institution knowingly:

(1) Facilitates the efforts of the Government of Iran (including efforts of Iran's Islamic Revolutionary Guard Corps or any of its agents or affiliates)—

(i) To acquire or develop weapons of mass destruction or delivery systems for weapons of mass destruction; or

(ii) To provide support for organizations designated as foreign terrorist organizations under section 219(a) of the Immigration and Nationality Act (8 U.S.C. 1189(a)) or support for acts of international terrorism, as defined in §561.312 of this part;

(2) Facilitates the activities of—

(i) A person subject to financial sanctions pursuant to United Nations Security Council Resolutions 1737, 1747, 1803, or 1929, or any other resolution adopted by the Security Council that imposes sanctions with respect to Iran; or

(ii) A person acting on behalf of or at the direction of, or owned or controlled by, a person described in paragraph (a)(2)(i) of this section;

NOTE TO PARAGRAPH (a)(2) OF §561.201: Persons subject to financial sanctions pursuant to the United Nations Security Council resolutions listed in §561.201(a)(2) include individuals and entities listed in the Annex to UNSC Resolution 1737, Annex I of UNSC Resolution 1747, Annexes I and III of UNSC Resolution 1803, and Annexes I, II, and III of UNSC Resolution 1929; and individuals and entities designated by the Security Council or by the Committee established pursuant to UNSC Resolution 1737 (the “Committee”) as being engaged in, directly associated with or providing support for Iran's proliferation sensitive nuclear activities, or the development of nuclear weapon delivery systems; and individuals and entities acting on behalf of or at the direction of those so listed or designated; and entities owned or controlled by those so listed or designated; and individuals and entities determined by the Security Council or the Committee to have assisted listed or designated individuals or entities in evading sanctions of, or in violating the provisions of, UNSC Resolutions 1737, 1747, 1803, or 1929.

(3) Engages in money laundering to carry out an activity described in paragraphs (a)(1) or (2) of this section;

(4) Facilitates efforts by the Central Bank of Iran or any other Iranian financial institution to carry out an activity described in paragraphs (a)(1) or (a)(2) of this section;

(5) Facilitates a significant transaction or transactions or provides significant financial services for—

(i) Iran's Islamic Revolutionary Guard Corps or any of its agents or affiliates whose property and interests in property are blocked pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) (“IEEPA”); or

(ii) A person whose property and interests in property are blocked pursuant to parts 544 or 594 of this chapter in connection with Iran's proliferation of weapons of mass destruction or delivery systems for weapons of mass destruction or Iran's support for international terrorism; or

Note to paragraph (a)(5) of §561.201: The names of persons whose property and interests in property are blocked pursuant to IEEPA are published in the Federal Register and incorporated into the Office of Foreign Assets Control's Specially Designated Nationals and Blocked Persons List (the “SDN List”). The SDN List is accessible through the following page on the Office of Foreign Assets Control's Web site: *www.treasury.gov/sdn.* Additional information pertaining to the SDN List can be found in appendix A to this chapter. Agents or affiliates of Iran's Islamic Revolutionary Guard Corps (“IRGC”) whose property and interests in property are blocked pursuant to IEEPA are identified by a special reference to the “IRGC” at the end of their entries on the SDN List, in addition to the reference to the regulatory part of this chapter pursuant to which their property and interests in property are blocked. For example, an affiliate of the IRGC whose property and interests in property are blocked pursuant to the Weapons of Mass Destruction Proliferators Sanctions Regulations, 31 CFR part 544, will have the tags “[NPWMD][IRGC]” at the end of its entry on the SDN List. Persons whose property and interests in property are blocked pursuant to parts 544 or 594 of this chapter in connection with Iran's proliferation of weapons of mass destruction or delivery systems for weapons of mass destruction or Iran's support for international terrorism also are identified by the tag “[IFSR]” in addition to the tag referencing part 544 or part 594, as the case may be, located at the end of their entries on the SDN List (e.g., [NPWMD][IFSR] or [SDGT][IFSR]). In addition, see §561.405 concerning entities that may not be listed on the SDN List but whose property and interests in property are nevertheless blocked.

(6) Facilitates, or participates or assists in, an activity described in paragraphs (a)(1) through (a)(5) of this section, including by acting on behalf of, at the direction of, or as an intermediary for, or otherwise assisting, another person with respect to the activity.

the activity.

(b) The Secretary of the Treasury may impose one or more strict conditions on the opening or maintaining by a U.S. financial institution of a correspondent account or a payable-through account in the United States for a foreign financial institution that the Secretary finds engages in one or more of the activities described in paragraph (a) of this section. Except as otherwise authorized pursuant to this part, a U.S. financial institution shall not open or maintain a correspondent account or payable-through account in the United States in a manner that is inconsistent with any strict condition imposed and in effect pursuant to this paragraph. Such conditions may include, but are not limited to, the following:

(1) Prohibiting or restricting any provision of trade finance through the correspondent account or payable-through account of the foreign financial institution;

(2) Restricting the transactions that may be processed through the correspondent account or payable-through account of the foreign financial institution to certain types of transactions, such as personal remittances;

(3) Placing monetary limits on, or limiting the volume of, the transactions that may be processed through the correspondent account or payable-through account of the foreign financial institution;

(4) Requiring pre-approval from the U.S. financial institution for all transactions processed through the correspondent account or payable-through account of the foreign financial institution; or

(5) Prohibiting or restricting the processing of foreign exchange transactions through the correspondent account or payable-through account of the foreign financial institution.

NOTE TO PARAGRAPH (b) OF §561.201: The name of the foreign financial institution, together with the actual strict condition or conditions to be imposed, will be added to the CAPTA List on the Office of Foreign Assets Control's Web site (*www.treasury.gov/ofac*), and published in the FEDERAL REGISTER.

(c) If the Secretary of the Treasury does not impose one or more strict conditions, pursuant to paragraph (b) of this section, on the opening or maintaining of a correspondent account or a payable-through account in the United States for a foreign financial institution that the Secretary finds engages in one or more of the activities described in paragraph (a) of this section, the Secretary, consistent with CISADA, will prohibit the opening or maintaining by a U.S. financial institution of a correspondent account or a payable-through account in the United States for that foreign financial institution. Except as otherwise authorized pursuant to this part, a U.S. financial institution shall not open or maintain a correspondent account or a payable-through account in the United States for a foreign financial institution for which the opening or maintaining of such an account is prohibited pursuant to this paragraph.

NOTE TO PARAGRAPH (c) OF §561.201: The names of foreign financial institutions for which the opening or maintaining of a correspondent account or a payable-through account in the United States is prohibited will be listed on the CAPTA List on the Office of Foreign Assets Control's Web site (*www.treasury.gov/ofac*), and published in the FEDERAL REGISTER.

NOTE TO §561.201: The CAPTA List will specify whether U.S. financial institutions are required to:

(1) Impose strict conditions on the opening or maintaining of a correspondent account or a payable-through account for a particular foreign financial institution pursuant to paragraph (b) of this section;

(2) Prohibit the opening or maintaining of a correspondent account or a payable-through account for a particular foreign financial institution pursuant to paragraph (c) of this section;

(3) Prohibit the opening or maintaining of a correspondent account or a payable-through account for a particular foreign financial institution pursuant to §561.203(a)(1) and (a)(2)(i); or

(4) Prohibit the opening of a correspondent account or a payable-through account and impose strict conditions on maintaining a preexisting correspondent account or a payable-through account for a particular foreign financial institution pursuant to §561.203(a)(1) and (a)(2)(ii). Where applicable, the CAPTA List also will specify the strict condition or conditions to be imposed on the correspondent account or the payable-through account.

[77 FR 11726, Feb. 27, 2012, as amended at 77 FR 66919, Nov. 8, 2012; 84 FR 9457, Mar. 15, 2019]

Back to Top

§561.202 Prohibitions on persons owned or controlled by U.S. financial institutions.

Except as otherwise authorized pursuant to this part, any person that is owned or controlled by a U.S. financial institution is prohibited from knowingly engaging in any transaction with or benefitting Iran's Islamic Revolutionary Guard Corps or any of its agents or affiliates whose property and interests in property are blocked pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) (“IEEPA”).

NOTE 1 TO §561.202: The names of persons whose property and interests in property are blocked pursuant to IEEPA are published in the FEDERAL REGISTER and incorporated into the Office of Foreign Assets Control's Specially Designated Nationals and Blocked Persons List (the “SDN List”). The SDN List is accessible through the following page on the Office of Foreign Assets Control's Web site: *www.treasury.gov/sdn.* Additional information pertaining to the SDN List can be found in appendix A to this chapter. Agents or affiliates of Iran's Islamic Revolutionary Guard Corps (“IRGC”) whose property and interests in property are blocked pursuant to IEEPA are identified by a special reference to the “IRGC” at the end of their entries on the SDN List, in addition to the reference to the regulatory part of this chapter pursuant to which their property and interests in property are blocked. For example, an affiliate of the IRGC whose property and interests in property are blocked pursuant to the Weapons of Mass Destruction Proliferators Sanctions Regulations, 31 CFR part 544, will have the tag “[NPWMD] [IRGC]” at the end of its entry on the SDN List. In addition, see §561.405 concerning entities that may not be listed on the SDN List but whose property and interests in property are nevertheless blocked.

NOTE 2 TO §561.202: A U.S. financial institution is subject to the civil penalties provided for in section 206(b) of IEEPA if any person that it owns or controls violates the prohibition set forth in this section and the U.S. financial institution knew or should have known of such violation. *See* §561.701(a)(2).

Back to Top

§561.203 NDAA-based sanctions on certain foreign financial institutions.

(a) *Imposition of sanctions.* Subject to the limitations, exceptions, and conditions set forth in paragraphs (d) through (k) of this section, upon a determination by the Secretary of the Treasury that a foreign financial institution has knowingly conducted or facilitated any significant financial transaction with the Central Bank of Iran or a designated Iranian financial institution, consistent with section 1245 of the National Defense Authorization Act for Fiscal Year 2012 (Pub. L. 112-81) (22 U.S.C. 8513a) (the “2012 NDAA”), as amended by the Iran Threat Reduction and Syria Human Rights Act of 2012 (Pub. L. 112-158) (22 U.S.C. 8701-8795) (the “TRA”), the Secretary of the Treasury:

(1) Will prohibit U.S. financial institutions from opening a correspondent account or a payable-through account in the United States for the foreign financial institution with respect to which the determination has been made; and either

(2)(i) Will prohibit U.S. financial institutions from maintaining a correspondent account or a payable-through account in the United States for the foreign financial institution with respect to which the determination has been made; or

(ii) Will impose one or more strict conditions on the maintaining of any correspondent account or payable-through account that had been opened in the United States for the foreign financial institution prior to the Secretary of the Treasury's determination with respect to the foreign financial institution.

Note 1 to paragraph (a) of §561.203: The names of *designated Iranian financial institutions* are identified on the Specially Designated Nationals and Blocked Persons List (the “SDN List”) on the Office of Foreign Assets Control's Web site with the tag “[NDAA]” at the end of their entries, in addition to the reference to the regulatory part of this chapter pursuant to which their property and interests in property are blocked. The SDN List is accessible through the following page on the Office of Foreign Assets Control's Web site: *www.treasury.gov/sdn.*

Note 2 to paragraph (a) of §561.203: The name of any foreign financial institution with respect to which a determination has been made pursuant to this paragraph (a), along with the relevant sanctions to be imposed (prohibition(s) and/or strict condition(s)), will be added to the List of Foreign Financial Institutions Subject to Correspondent Account or Payable-Through Account Sanctions (CAPTA List), which is maintained on the Office of Foreign Assets Control's Web site (*www.treasury.gov/ofac*), and published in the Federal Register.

(b) *Strict conditions.* The strict conditions that might be imposed on the maintaining of a pre-existing correspondent account or payable-through account for a foreign financial institution pursuant to paragraph (a)(2)(ii) of this section include, but are not limited to, the following:

(1) Prohibiting or restricting any provision of trade finance through the correspondent account or payable-through account of the foreign financial institution;

(2) Restricting the transactions that may be processed through the correspondent account or payable-through account of the foreign financial institution to certain types of transactions, such as personal remittances;

(3) Placing monetary limits on, or limiting the volume of, the transactions that may be processed through the correspondent account or payable-through account of the foreign financial institution;

(4) Requiring pre-approval from the U.S. financial institution for all transactions processed through the correspondent account or payable-through account of the foreign financial institution; or

(5) Prohibiting or restricting the processing of foreign exchange transactions through the correspondent account or payable-through account of the foreign

financial institution.

(c) *Prohibitions.* (1) Except as otherwise authorized pursuant to this part, a U.S. financial institution shall not open a correspondent account or payable-through account in the United States for a foreign financial institution for which the opening of such an account is prohibited pursuant to paragraph (a)(1) of this section.

(2) Except as otherwise authorized pursuant to this part, a U.S. financial institution shall not maintain a correspondent account or payable-through account in the United States for a foreign financial institution for which the maintaining of such an account is prohibited pursuant to paragraph (a)(2)(i) of this section.

(3) Except as otherwise authorized pursuant to this part, a U.S. financial institution shall not maintain a correspondent account or payable-through account in the United States for a foreign financial institution in a manner that is inconsistent with any strict condition imposed and in effect pursuant to paragraph (a)(2)(ii) of this section.

(d) *Privately owned foreign financial institutions.* (1) Subject to the exceptions set forth in paragraphs (g) and (i) through (k) of this section, sanctions may be imposed pursuant to paragraph (a) of this section beginning on February 29, 2012, with respect to any significant financial transaction conducted or facilitated by a privately owned foreign financial institution that is not for the purchase of petroleum or petroleum products from Iran.

(2) Subject to the exceptions and conditions set forth in paragraphs (h) through (k) of this section, sanctions may be imposed pursuant to paragraph (a) of this section with respect to any significant financial transaction conducted or facilitated by a privately owned foreign financial institution on or after June 28, 2012, for the purchase of petroleum or petroleum products from Iran.

(e) *Government-owned or -controlled foreign financial institutions, excluding foreign central banks.* (1) Subject to the exceptions and conditions set forth in paragraphs (h) through (k) of this section, sanctions may be imposed pursuant to paragraph (a) of this section with respect to any significant financial transaction conducted or facilitated by a foreign financial institution owned or controlled by the government of a foreign country, excluding a central bank of a foreign country, on or after June 28, 2012, for the sale or purchase of petroleum or petroleum products to or from Iran.

(2) Subject to the exceptions and conditions set forth in paragraphs (g) and (i) through (k) of this section, sanctions may be imposed pursuant to paragraph (a) of

this section with respect to any significant financial transaction conducted or facilitated by a foreign financial institution owned or controlled by the government of a foreign country, excluding a central bank of a foreign country, on or after February 6, 2013, that is not for the sale or purchase of petroleum or petroleum products to or from Iran.

(f) *Foreign central banks.* Subject to the exceptions and conditions set forth in paragraphs (h) through (k) of this section, sanctions may be imposed pursuant to paragraph (a) of this section on a central bank of a foreign country only insofar as it engages in a financial transaction for the sale or purchase of petroleum or petroleum products to or from Iran conducted or facilitated on or after June 28, 2012.

(g) Sanctions will not be imposed under paragraph (a) of this section with respect to any foreign financial institution for conducting or facilitating a transaction for the sale of agricultural commodities, food, medicine, or medical devices to Iran.

(h) The Secretary of the Treasury may impose sanctions pursuant to paragraph (a) of this section with respect to any significant financial transaction conducted or facilitated by a foreign financial institution on or after June 28, 2012, for the purchase of petroleum or petroleum products from Iran only if the President determines, not later than March 30, 2012, and every 180 days thereafter, that there is a sufficient supply of petroleum and petroleum products from countries other than Iran to permit a significant reduction in petroleum and petroleum products purchased from Iran by or through foreign financial institutions. Such successive sufficiency determinations by the President shall render subject to sanctions under paragraph (a) of this section those financial transactions conducted or facilitated by a foreign financial institution for the purchase of petroleum or petroleum products from Iran during each successive 180-day period beginning 90 days after the President's determination.

NOTE TO PARAGRAPH (h) OF §561.203: Under Section 1245(d)(4)(B) of the 2012 NDAA, the President is to make a determination, not later than March 30, 2012, and every 180 days thereafter, of whether the price and supply of petroleum and petroleum products produced in countries other than Iran is sufficient to permit purchasers of petroleum and petroleum products from Iran to reduce significantly their purchases from Iran. This determination is to be based on reports on the availability and price of petroleum and petroleum products produced in countries other than Iran that, pursuant to section 1245(d)(4)(A) of the 2012 NDAA, the Administrator of the Energy Information Administration, in consultation with the Secretary of the Treasury, the Secretary of State, and the Director of National Intelligence, was to submit to Congress beginning not later than February 29, 2012, and every 60 days thereafter. Beginning September 1, 2012, pursuant to section 1245(d)(4)(A) of the 2012 NDAA, as amended by section 503(b) of the TRA, the report of the Administrator of the Energy Information Administration is to be submitted to Congress not later than October 25, 2012, and the last Thursday of every other month thereafter.

(i) Sanctions will not be imposed under paragraph (a) of this section with respect to a financial transaction described in paragraph (j) of this section that is conducted or facilitated by a foreign financial institution if, for the 180-day period during which the financial transaction is conducted or facilitated, the Secretary of State has determined and reported to Congress:

(1) That the country with primary jurisdiction over the foreign financial institution has significantly reduced its crude oil purchases from Iran, thus qualifying for a "significant reduction exception" for the 180-day period during which the financial transaction is conducted or facilitated; or

(2) That the country with primary jurisdiction over the foreign financial institution has received a significant reduction exception described in this paragraph in a previous period and, after receiving the exception, has reduced its crude oil purchases from Iran to zero during a subsequent 180-day reporting period.

NOTE TO PARAGRAPH (i) OF §561.203: The Secretary of State is to determine whether a country qualifies for the "significant reduction exception" and report such determination to Congress not later than 90 days after the date on which the President makes the initial determination referenced in paragraph (h) of this section, and every 180 days thereafter. Accordingly, a significant reduction exception covers a period of 180 days.

(j) A financial transaction conducted or facilitated by a foreign financial institution is described in this paragraph (j) if:

(1) The financial transaction is only for trade in goods or services that either originate in the country with primary jurisdiction over the foreign financial institution and are exported and sold directly to Iran or originate in Iran and are exported and sold directly to the country with primary jurisdiction over the foreign financial institution;

(2) Any funds owed to the country with primary jurisdiction over the foreign financial institution as a result of such trade are paid to:

(i) Individuals who are citizens, nationals, or permanent residents of the country with primary jurisdiction over the foreign financial institution; or

(ii) Entities organized under the laws of the country with primary jurisdiction over the foreign financial institution that are not the Government of Iran, as defined in §561.321;

(3) Any funds owed to Iran as a result of such trade are subject to the terms and conditions set forth in paragraph (k) of this section; and

(4) Funds owed as a result of such trade are not credited to an account held at any financial institution whose name appears on the List of Foreign Financial Institutions Subject to Correspondent Account or Payable-Through Account Sanctions (CAPTA List), which is maintained on the Office of Foreign Assets Control's Web site (*www.treasury.gov/ofac*).

(k) In order for a transaction to qualify for the significant reduction exception from the sanctions imposed under paragraph (a) of this section described in paragraph (i), all funds owed to Iran as a result of a trade transaction described in paragraph (j)(1) of this section must be subject to the following conditions and restrictions:

(1) The funds must be credited to an account held at a foreign financial institution that conducted or facilitated the trade transaction described in paragraph (j)(1) of this section;

(2) The funds must be credited to an account held in the country with primary jurisdiction over that foreign financial institution;

(3) The funds must be credited to an account held in the name of the Central Bank of Iran, the Iranian party to the trade transaction, or an Iranian financial institution that is not a designated Iranian financial institution;

(4) Payments from the funds may be made only in the manner and to the persons specified in paragraph (k)(5) of this section for amounts owed to such persons for the direct exportation and sale to Iran of goods or services originating in the country with primary jurisdiction over the foreign financial institution holding the funds (*but see* Note 2 to §561.203);

(5) Payments from the funds for the goods or services exported and sold to Iran, as described in paragraph (k)(4) of this section, may be made only by check payable to or to the order of, or by transfer to an account at a foreign financial institution in the country with primary jurisdiction over the foreign financial institution holding the funds that is held in the name of:

(i) Individuals who are citizens, nationals, or permanent residents of the country with primary jurisdiction over the foreign financial institution holding the funds; or

(ii) Entities that are organized under the laws of that country;

(6) The funds may not be withdrawn in cash, remitted to Iran or paid to anyone that is the *Government of Iran,* as defined in §561.321, or credited to an account held at a financial institution whose name appears on the CAPTA List (see paragraph (j)(4) of this section); and

(7) Other than in payment for goods or services exported and sold to Iran as set forth in paragraphs (k)(4) through (k)(6) of this section, the funds may be transferred from the initial account described in paragraphs (k)(1) through (k)(3) of this section only to another account that is held at the same foreign financial institution, located in the country with primary jurisdiction over that foreign financial institution, and subject to the following conditions and restrictions:

(i) The account must be a separate, special purpose account holding only funds owed to Iran as a result of trade transactions that qualify for the significant reduction exception described in paragraph (i) of this section and that are conducted or facilitated by the foreign financial institution holding the account; and

(ii) The conditions and restrictions on the funds owed to Iran set forth in paragraphs (k)(1) through (k)(6) of this section apply in full to the account described in this paragraph, except that the account must be held only in the name of the Central Bank of Iran or an Iranian financial institution that is not a designated Iranian financial institution.

NOTE TO PARAGRAPHS (j) AND (k) OF §561.203: *See* §561.408 for a provision interpreting the phrases goods or services originating in the country with primary jurisdiction over the foreign financial institution and goods or services originating in Iran.

NOTE 1 TO §561.203: The sanctions regime described in §561.203 is separate from the sanctions regimes described in §§561.201 and 561.204 and applies in addition to, and independently of, the sanctions regimes imposed under §§561.201 and 561.204.

NOTE 2 TO §561.203: Paragraph (g) of this section excepts transactions for the sale of agricultural commodities, food, medicine, or medical devices to Iran from the imposition of sanctions under paragraph (a) of this section. Therefore, funds owed to Iran as a result of a trade transaction described in paragraph (j)(1) of this section may be used for the purchase and export to Iran of agricultural commodities, food, medicine, or medical devices regardless of the country from which such goods are purchased and regardless of where such goods originate, and payment from the funds for such goods may be made to exporters in countries other than the country with primary jurisdiction over the foreign financial institution holding the funds.

[77 FR 11726, Feb. 27, 2012, as amended at 78 FR 16405, Mar. 15, 2013; 84 FR 9457, Mar. 15, 2019]

§561.204 Additional petroleum-related sanctions on certain foreign financial institutions.

(a) *Imposition of sanctions.* Subject to the limitations, exceptions, and conditions set forth in paragraphs (d) through (f) of this section, upon a determination by the Secretary of the Treasury that a foreign financial institution has knowingly engaged in one or more of the activities described in paragraph (b) of this section, the Secretary of the Treasury may:

(1) Prohibit U.S. financial institutions from opening a correspondent account or a payable-through account in the United States for the foreign financial institution with respect to which the determination has been made; and either

(2)(i) Prohibit U.S. financial institutions from maintaining a correspondent account or a payable-through account in the United States for the foreign financial institution with respect to which the determination has been made; or

(ii) Impose one or more strict conditions on the maintaining of any correspondent account or payable-through account that had been opened in the United States for the foreign financial institution prior to the Secretary of the Treasury's determination with respect to the foreign financial institution.

NOTE 1 TO PARAGRAPH (a) OF §561.204: The name of any foreign financial institution with respect to which a determination has been made pursuant to this paragraph (a), along with the relevant sanctions to be imposed (prohibition(s) and/or strict condition(s)), will be added to the List of Foreign Financial Institutions Subject to Correspondent Account or Payable-Through Account Sanctions (CAPTA List), which is maintained on the Office of Foreign Assets Control's Web site (*www.treasury.gov/ofac*), and published in the FEDERAL REGISTER.

NOTE 2 TO PARAGRAPH (a) OF §561.204: *See* §561.203(b) for examples of strict conditions that might be imposed, pursuant to paragraph (a)(2)(ii) of this section, on the maintaining of a pre-existing correspondent account or payable-through account for a foreign financial institution with respect to which the Secretary of the Treasury's determination has been made.

(b) *Sanctionable activity.* A foreign financial institution engages in an activity described in this paragraph if it knowingly conducts or facilitates any significant financial transaction:

(1) With the National Iranian Oil Company ("NIOC"), the Naftiran Intertrade Company ("NICO"), or any entity owned or controlled by, or operating for or on behalf of, NIOC or NICO, except for a sale or provision to any of the foregoing of the products described in section 5(a)(3)(A)(i) of the Iran Sanctions Act of 1996 (Pub. L.

104-172) (50 U.S.C. 1701 note), as amended, provided that the fair market value of such products is lower than the applicable dollar threshold specified in that provision;

NOTE TO PARAGRAPH (b)(1) OF §561.204: As of March 15, 2013, the products described in section 5(a)(3)(A)(i) of the Iran Sanctions Act of 1996 (Pub. L. 104-172) (50 U.S.C. 1701 note), as amended, are refined petroleum products, and for the fair market value of such products to be lower than the applicable dollar threshold specified in that provision the products sold or provided to NIOC, NICO, or any entity owned or controlled by, or operating for or on behalf of, NIOC or NICO, must have a fair market value of less than $1,000,000, and, during a 12-month period, an aggregate fair market value of less than $5,000,000.

(2) For the purchase or acquisition of petroleum or petroleum products from Iran; or

(3) For the purchase or acquisition of petrochemical products from Iran.

(c) *Prohibitions.* (1) A U.S. financial institution shall not open a correspondent account or payable-through account in the United States for a foreign financial institution for which the opening of such an account is prohibited pursuant to paragraph (a)(1) of this section.

(2) A U.S. financial institution shall not maintain a correspondent account or payable-through account in the United States for a foreign financial institution for which the maintaining of such an account is prohibited pursuant to paragraph (a)(2)(i) of this section.

(3) A U.S. financial institution shall not maintain a correspondent account or payable-through account in the United States for a foreign financial institution in a manner that is inconsistent with any strict condition imposed and in effect pursuant to paragraph (a)(2)(ii) of this section.

(4) The prohibitions in paragraphs (c)(1) through (c)(3) of this section apply except to the extent transactions are authorized by regulations, orders, directives, or licenses that may be issued pursuant to this part, and notwithstanding any contracts entered into or any license or permit granted prior to the effective date of the prohibition.

(d) *Exempt activity.* Sanctions will not be imposed under paragraph (a) of this section with respect to any foreign financial institution for:

(1) Conducting or facilitating a transaction for the sale of agricultural commodities, food, medicine, or medical devices to Iran or when the underlying transaction has been authorized by the Office of Foreign Assets Control pursuant to any part of this chapter V; or

(2) Conducting or facilitating a transaction involving a natural gas development and pipeline project initiated prior to July 31, 2012, to bring gas from Azerbaijan to Europe and Turkey in furtherance of a production sharing agreement or license awarded by a sovereign government other than the Government of Iran before July 31, 2012.

Note to paragraph (d)(2) of §561.204: The natural gas development and pipeline project referred to in this paragraph is the project to develop the Shah Deniz natural gas field in Azerbaijan's sector of the Caspian Sea and related pipeline projects to bring the gas from Azerbaijan to Europe and Turkey.

(e) The Secretary of the Treasury may impose sanctions pursuant to paragraph (a) of this section with respect to any significant financial transaction described in paragraphs (b)(1) and (b)(2) of this section only if the President makes the successive determinations that there is a sufficient supply of petroleum and petroleum products from countries other than Iran described in paragraph (h) of §561.203.

(f) Sanctions will not be imposed under paragraph (a) of this section with respect to any significant financial transaction described in paragraphs (b)(1) and (b)(2) of this section that is conducted or facilitated by a foreign financial institution if:

(1) For the 180-day period during which the financial transaction is conducted or facilitated, the Secretary of State has determined and reported to Congress:

(i) That the country with primary jurisdiction over the foreign financial institution has significantly reduced its crude oil purchases from Iran, thus qualifying for the “significant reduction exception” for the 180-day period during which the financial transaction is conducted or facilitated; or

(ii) That the country with primary jurisdiction over the foreign financial institution has received a significant reduction exception described in this paragraph in a previous period, and, after receiving the exception, has reduced its crude oil purchases from Iran to zero during a subsequent 180-day reporting period; and

(2) The transaction satisfies the conditions and restrictions set forth in paragraphs (j) and (k) of §561.203.

NOTE TO PARAGRAPH (f) OF §561.204: The Secretary of State is to determine whether a country qualifies for the "significant reduction exception" and report such determination to Congress not later than 90 days after the date on which the President makes the initial determination referenced in paragraph (h) of this section, and every 180 days thereafter. Accordingly, a significant reduction exception covers a period of 180 days.

NOTE TO §561.204: The sanctions regime described in this section is separate from the sanctions regimes described in §§561.201 and 561.203 and applies in addition to, and independently of, the sanctions regimes imposed under §§561.201 and 561.203.

[78 FR 16407, Mar. 15, 2013, as amended at 84 FR 9457, Mar. 15, 2019]

§561.205 Metals-related sanctions on certain foreign financial institutions.

(a) *Imposition of sanctions.* Subject to the exemptions set forth in paragraph (d) of this section, upon a determination by the Secretary of the Treasury, in consultation with the Secretary of State, that a foreign financial institution has, on or after May 8, 2019, knowingly engaged in one or more of the activities described in paragraph (b) of this section, the Secretary of the Treasury may:

(1) Prohibit U.S. financial institutions from opening a correspondent account or a payable-through account in the United States for the foreign financial institution with respect to which the determination has been made; and either

(2)(i) Prohibit U.S. financial institutions from maintaining a correspondent account or a payable-through account in the United States for the foreign financial institution with respect to which the determination has been made; or

(ii) Impose one or more strict conditions on the maintaining of a correspondent account or payable-through account in the United States for the foreign financial institution with respect to which the determination has been made.

NOTE 1 TO PARAGRAPH (a): The name of any foreign financial institution with respect to which a determination has been made pursuant to this paragraph (a), along with the relevant sanctions to be imposed (prohibition(s) and/or strict condition(s)), will be added to the List of Foreign Financial Institutions Subject to Correspondent Account or Payable-Through Account Sanctions (CAPTA List), which is maintained on the Office of Foreign Assets Control's website (*www.treasury.gov/ofac*), and published in the FEDERAL REGISTER.

NOTE 2 TO PARAGRAPH (a): *See* §561.203(b) for examples of strict conditions that might be imposed, pursuant to paragraph (a)(2)(ii) of this section, on the maintaining of a correspondent account or payable-through account for a foreign financial institution with respect to which the Secretary of the Treasury's determination has been made.

(b) *Sanctionable activity.* A foreign financial institution has engaged in an activity described in this paragraph if it knowingly conducted or facilitated, on or after May 8, 2019, any significant financial transaction:

(1) For the sale, supply, or transfer to Iran of significant goods or services used in connection with the iron, steel, aluminum, or copper sectors of Iran;

(2) For the purchase, acquisition, sale, transport, or marketing of iron, iron products, aluminum, aluminum products, steel, steel products, copper, or copper products from Iran; or

(3) For or on behalf of any person whose property and interests in property are blocked pursuant to Executive Order 13871.

(c) *Prohibitions.* (1) A U.S. financial institution shall not open a correspondent account or payable-through account in the United States for a foreign financial institution for which the opening of such an account is prohibited pursuant to paragraph (a)(1) of this section.

(2) A U.S. financial institution shall not maintain a correspondent account or payable-through account in the United States for a foreign financial institution for which the maintaining of such an account is prohibited pursuant to paragraph (a)(2)(i) of this section.

(3) A U.S. financial institution shall not maintain a correspondent account or payable-through account in the United States for a foreign financial institution in a manner that is inconsistent with any strict condition imposed and in effect pursuant to paragraph (a)(2)(ii) of this section.

(4) The prohibitions in paragraphs (c)(1) through (c)(3) of this section apply except to the extent provided by regulations, orders, directives, or licenses that may be issued pursuant to this part, and notwithstanding any contract entered into or any license or permit granted prior to the effective date.

(d) *Exempt activity.* Nothing in this section shall apply to transactions for the conduct of the official business of the Federal Government or the United Nations (including its specialized agencies, programmes, funds, and related organizations) by employees, grantees, or contractors thereof.

[84 FR 38547, Aug. 7, 2019]

§561.220 Evasions; attempts; causing violations; conspiracies.

(a) Any transaction on or after the effective date that evades or avoids, has the purpose of evading or avoiding, causes a violation of, or attempts to violate any of the prohibitions set forth in this part is prohibited.

(b) Any conspiracy formed to violate any of the prohibitions set forth in this part is prohibited.

Title 31: Money and Finance: Treasury
PART 561—IRANIAN FINANCIAL SANCTIONS REGULATIONS

Subpart C—General Definitions

Contents

Back to Top

§561.301 Effective date.

(a) The effective date of a prohibition or condition imposed pursuant to §§561.201, 561.203, 561.204, or 561.205 on the opening or maintaining of a correspondent account or a payable-through account in the United States by a U.S. financial institution for a particular foreign financial institution is the earlier of the date the U.S. financial institution receives actual or constructive notice of such prohibition or condition.

(b) The effective date of the prohibition contained in §561.202 with respect to Iran's Islamic Revolutionary Guard Corps and any of its agents or affiliates whose property and interests in property are blocked as of August 16, 2010, is August 16, 2010.

(c) The effective date of the prohibition contained in §561.202 with respect to an agent or affiliate of Iran's Islamic Revolutionary Guard Corps whose property and interests in property become blocked after August 16, 2010, is the earlier of the date of actual or constructive notice that such person's property and interests in property are blocked.

(d) For the purposes of this section, *constructive notice* is the date that notice of the blocking of the relevant person's property and interests in property is published in the FEDERAL REGISTER.

[77 FR 11726, Feb. 27, 2012, as amended at 78 FR 16408, Mar. 15, 2013; 84 FR 38547, Aug. 7, 2019]

⮥ Back to Top

§561.306 Correspondent account.

The term *correspondent account* means an account established by a U.S. financial institution for a foreign financial institution to receive deposits from, or to make payments on behalf of, the foreign financial institution, or to handle other financial transactions related to such foreign financial institution.

⮥ Back to Top

§561.307 Payable-through account.

The term *payable-through account* means a correspondent account maintained by a U.S. financial institution for a foreign financial institution by means of which the foreign financial institution permits its customers to engage, either directly or through foreign financial institution permits its customers to engage, either directly or through a subaccount, in banking activities usual in connection with the business of banking in the United States.

Back to Top

§561.308 Foreign financial institution.

The term *foreign financial institution* means any foreign entity that is engaged in the business of accepting deposits, making, granting, transferring, holding, or brokering loans or credits, or purchasing or selling foreign exchange, securities, commodity futures or options, or procuring purchasers and sellers thereof, as principal or agent. It includes but is not limited to depository institutions, banks, savings banks, money service businesses, trust companies, securities brokers and dealers, commodity futures and options brokers and dealers, forward contract and foreign exchange merchants, securities and commodities exchanges, clearing corporations, investment companies, employee benefit plans, dealers in precious metals, stones, or jewels, and holding companies, affiliates, or subsidiaries of any of the foregoing. The term does not include the international financial institutions identified in 22 U.S.C. 262r(c)(2), the International Fund for Agricultural Development, the North American Development Bank, or any other international financial institution so notified by the Office of Foreign Assets Control.

[77 FR 66920, Nov. 8, 2012]

Back to Top

§561.309 U.S. financial institution.

The term *U.S. financial institution* means any U.S. entity that is engaged in the business of accepting deposits, making, granting, transferring, holding, or brokering loans or credits, or purchasing or selling foreign exchange, securities, commodity futures or options, or procuring purchasers and sellers thereof, as principal or agent. It includes but is not limited to depository institutions, banks, savings banks, money service businesses, trust companies, insurance companies, securities brokers and dealers, commodity futures and options brokers and dealers, forward contract and foreign exchange merchants, securities and commodities exchanges, clearing corporations, investment companies, employee benefit plans, and U.S. holding companies, U.S. affiliates, or U.S. subsidiaries of any of the foregoing. This term includes those branches, offices, and agencies of foreign financial institutions that are located in the United States, but not such institutions' foreign branches, offices, or agencies.

Back to Top

§561.310 Money laundering.

The term *money laundering* means engaging in deceptive practices to obscure the nature of transactions involving the movement of illicit cash or illicit cash equivalent proceeds into, out of, or through a country, or into, out of, or through a financial institution, such that the transactions are made to appear legitimate.

Back to Top

§561.311 Agent.

The term *agent* includes an entity established by a person for purposes of conducting transactions on behalf of the person in order to conceal the identity of the person.

Back to Top

§561.312 Act of international terrorism.

The term *act of international terrorism* has the same definition as that provided under section 14 of the Iran Sanctions Act of 1996 (50 U.S.C. 1701 note). As of February 27, 2012, the term *act of international terrorism* means an act which is violent or dangerous to human life and that is a violation of the criminal laws of the United States or of any state or that would be a criminal violation if committed within the jurisdiction of the United States or any state and which appears to be intended to intimidate or coerce a civilian population; to influence the policy of a government by intimidation or coercion; or to affect the conduct of a government by assassination or kidnapping.

§561.315 Person.

The term *person* means an individual or entity.

Back to Top

§561.316 Entity.

The term *entity* means a partnership, association, trust, joint venture, corporation, or other organization.

Back to Top

§561.317 Money service businesses.

The term *money service businesses* means any agent, agency, branch, or office of any person doing business, whether or not on a regular basis or as an organized business concern, in one or more of the capacities listed in 31 CFR 103.11(uu)(1) through (5). The term does not include a bank or a person registered with, and regulated or examined by, the Securities and Exchange Commission or the Commodity Futures Trading Commission.

Back to Top

§561.318 Petroleum.

The term *petroleum* (also known as crude oil) means a mixture of hydrocarbons that exists in liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities.

[78 FR 16408, Mar. 15, 2013]

Back to Top

§561.319 Petroleum products.

The term *petroleum products* includes unfinished oils, liquefied petroleum gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosene-type jet fuel, kerosene, distillate fuel oil, residual fuel oil, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. The term does not include natural gas, liquefied natural gas, biofuels, methanol, and other non-petroleum fuels.

Back to Top

§561.320 Iranian financial institution.

The term *Iranian financial institution* means any entity (including foreign branches), wherever located, organized under the laws of Iran or any jurisdiction within Iran, or owned or controlled by the Government of Iran, or in Iran, or owned or controlled by any of the foregoing, that is engaged in the business of accepting deposits, making, granting, transferring, holding, or brokering loans or credits, or purchasing or selling foreign exchange, securities, commodity futures or options, or procuring purchasers and sellers thereof, as principal or agent. It includes but is not limited to depository institutions, banks, savings banks, money service businesses, trust companies, insurance companies, securities brokers and dealers, commodity futures and options brokers and dealers, forward contract and foreign exchange merchants, securities and commodities exchanges, clearing corporations, investment companies, employee benefit plans, dealers in precious metals, stones, or jewels, and holding companies, affiliates, or subsidiaries of any of the foregoing.

[77 FR 66920, Nov. 8, 2012]

Back to Top

§561.321 Government of Iran.

The term *Government of Iran* includes:

(a) The state and the Government of Iran, as well as any political subdivision, agency, or instrumentality thereof;

(b) Any entity owned or controlled directly or indirectly by the foregoing;

(c) Any person to the extent that such person is, or has been, or to the extent that there is reasonable cause to believe that such person is, or has been, acting or purporting to act directly or indirectly on behalf of any of the foregoing; and

(d) Any person or entity identified by the Secretary of the Treasury to be the Government of Iran under 31 CFR part 560.

⮤ Back to Top

§561.322 Entity owned or controlled by the Government of Iran.

The phrase *entity owned or controlled by the Government of Iran* means any entity, including a financial institution, in which the Government of Iran owns a 50 percent or greater interest or a controlling interest, and any entity, including a financial institution, which is otherwise controlled by that government.

⮤ Back to Top

§561.323 Foreign financial institution owned or controlled by the government of a foreign country.

The phrase *foreign financial institution owned or controlled by the government of a foreign country* means any foreign financial institution, including a central bank of a foreign country, in which a government of a foreign country owns a 50 percent or greater interest and any foreign financial institution which is otherwise controlled by a government of a foreign country.

⮤ Back to Top

§561.324 Designated Iranian financial institution.

The term *designated Iranian financial institution* means any Iranian financial institution whose property and interests in property are blocked by the Department of the Treasury pursuant to any part of this chapter or any Executive order issued pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) and whose name is listed on the Specially Designated Nationals and Blocked Persons List on the Office of Foreign Assets Control's Web site, except for any Iranian financial institution whose property and interests in property are blocked solely pursuant to Executive Order 13599 of February 5, 2012.

Note to §561.324: Facilitating significant transactions or providing significant financial services for a financial institution whose property and interests in property are blocked pursuant to parts 544 or 594 of this chapter in connection with Iran's proliferation of weapons of mass destruction or delivery systems for weapons of mass destruction or Iran's support for international terrorism has, since the enactment of CISADA on July 1, 2010, constituted an activity that could subject a foreign financial institution to prohibitions or strict conditions on correspondent accounts or payable-through accounts in the United States. See §561.201.

See §561.201.

§561.327 Agricultural commodities, food, medicine, and medical devices.

(a) The term *agricultural commodities* means:

(1) Products not listed on the Commerce Control List in the Export Administration Regulations, 15 CFR part 774, supplement no. 1, that fall within the term "agricultural commodity" as defined in section 102 of the Agricultural Trade Act of 1978 (7 U.S.C. 5602); and

(2) Products not listed on the Commerce Control List in the Export Administration Regulations, 15 CFR part 774, supplement no. 1, that are intended for ultimate use in Iran as:

(i) Food for humans (including raw, processed, and packaged foods; live animals; vitamins and minerals; food additives or supplements; and bottled drinking water) or animals (including animal feeds);

(ii) Seeds for food crops;

(iii) Fertilizers or organic fertilizers; or

(iv) Reproductive materials (such as live animals, fertilized eggs, embryos, and semen) for the production of food animals.

(b) The term *food* means items that are intended to be consumed by and provide nutrition to humans or animals in Iran, including vitamins and minerals, food additives and supplements, and bottled drinking water, and seeds that germinate into items that are intended to be consumed by and provide nutrition to humans or animals in Iran. For purposes of this definition, the term *food* does not include:

(1) Alcoholic beverages, cigarettes, gum, or fertilizer; and

(2) The following excluded food items: castor beans, castor bean seeds, raw eggs, fertilized eggs (other than fish and shrimp roe), dried egg albumin, live animals, Rosary/Jequirity peas, non-food-grade gelatin powder, and peptones and their derivatives.

(c) The term *medicine* has the same meaning given the term “drug” in section 201 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321) but does not include any item listed on the Commerce Control List in the Export Administration Regulations, 15 CFR part 774, supplement no. 1 (excluding items classified as EAR 99).

(d) The term *medical devices* has the meaning given the term “device” in section 201 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321) but does not include any item listed on the Commerce Control List in the Export Administration Regulations, 15 CFR part 774, supplement no. 1 (excluding items classified as EAR 99).

Title 31: Money and Finance: Treasury
PART 561—IRANIAN FINANCIAL SANCTIONS REGULATIONS

Subpart D—Interpretations

Contents

Back to Top

§561.401 Reference to amended sections.

Except as otherwise specified, reference to any provision in or appendix to this part or chapter or to any regulation, ruling, order, instruction, directive, or license issued pursuant to this part refers to the same as currently amended.

Back to Top

§561.402 Effect of amendment.

Unless otherwise specifically provided, any amendment, modification, or revocation of any provision in or appendix to this part or chapter or of any order revocation of any provision in or appendix to this part or chapter or of any order, regulation, ruling, instruction, or license issued by the Office of Foreign Assets Control does not affect any act done or omitted, or any civil or criminal proceeding commenced or pending, prior to such amendment, modification, or revocation. All penalties, forfeitures, and liabilities under any such order, regulation, ruling, instruction, or license continue and may be enforced as if such amendment, modification, or revocation had not been made.

§561.403 Facilitation of certain efforts, activities, or transactions by foreign financial institutions.

For purposes of §§561.201, 561.203, 561.204, and 561.205, the term *facilitate* or *facilitated* used with respect to certain efforts, activities, or transactions refers to the provision of assistance by a foreign financial institution for those efforts, activities, or transactions, including the provision of currency, financial instruments, securities, or any other transmission of value; purchasing; selling; transporting; swapping; brokering; financing; approving; guaranteeing; or the provision of other services of any kind; or the provision of personnel; or the provision of software, technology, or goods of any kind.

§561.404 Significant transaction or transactions; significant financial services; significant financial transaction.

In determining, for purposes of paragraph (a)(5) of §561.201, whether a transaction is significant, whether transactions are significant, or whether financial services are significant, or, for purposes of paragraph (a) of §561.203, paragraph (b) of §561.204, and paragraph (b) of §561.205 whether a financial transaction is significant, the Secretary of the Treasury may consider the totality of the facts and circumstances. As a general matter, the Secretary may consider some or all of the following factors:

(a) *Size, number, and frequency.* The size, number, and frequency of transactions, financial services, or financial transactions performed over a period of time, including whether the transactions, financial services, or financial transactions are increasing or decreasing over time and the rate of increase or decrease.

(b) *Nature.* The nature of the transaction(s), financial services, or financial transaction, including the type, complexity, and commercial purpose of the transaction(s), financial services, or financial transaction.

(c) *Level of Awareness; Pattern of Conduct.* (1) Whether the transaction(s), financial services, or financial transaction is performed with the involvement or approval of management or only by clerical personnel; and (2) Whether the transaction(s), financial services, or financial transaction is part of a pattern of conduct or the result of a business development strategy.

(d) *Nexus.* The proximity between the foreign financial institution engaging in the transaction(s) or providing the financial services and a blocked person described in paragraph (a)(5) of §561.201, or between the foreign financial institution conducting or facilitating the financial transaction described in paragraph (a) of §561.203 and the Central Bank of Iran or a designated Iranian financial institution, as defined in §561.324, or between the foreign financial institution conducting or facilitating the financial transaction described in paragraph (b) of §561.204 and the National Iranian Oil Company ("NIOC"), the Naftiran Intertrade Company ("NICO"), any entity owned or controlled by, or operating for or on behalf of, NIOC or NICO, or the activities described in paragraphs (b)(2) and (b)(3) of that section. For example, a transaction or financial service in which a foreign financial institution provides brokerage or clearing services to, or maintains an account or makes payments for, a blocked person described in paragraph (a)(5) of §561.201, the Central Bank of Iran, a designated Iranian financial institution, NIOC, or NICO in a direct customer relationship generally would be of greater significance than a transaction or financial service a foreign financial institution conducts for or provides to a blocked person described in paragraph (a)(5) of §561.201, the Central Bank of Iran, a designated Iranian financial institution, NIOC, or NICO indirectly or in a tertiary relationship.

(e) *Impact.* The impact of the transaction(s) or financial services on the objectives of the Comprehensive Iran Sanctions, Accountability, and Divestment Act of 2010, as amended by the Iran Threat Reduction and Syria Human Rights Act of 2012 ("TRA"), or of the financial transaction on the objectives of the National Defense Authorization Act for Fiscal Year 2012, as amended by TRA, or of the financial transaction on the objectives of Executive Order 13622 of July 30, 2012, including:

(1) The economic or other benefit conferred or attempted to be conferred on a blocked person described in paragraph (a)(5) of §561.201, on the Central Bank of Iran or a designated Iranian financial institution, or on NIOC, NICO, any entity owned or controlled by, or operating for or on behalf of, NIOC or NICO, or any

person engaged in the activities described in paragraphs (b)(2) and (b)(3) of §561.204;

(2) Whether and how the transaction(s), financial services, or financial transaction contributes to the proliferation of weapons of mass destruction or delivery systems for such weapons, to support for international terrorism, to the suppression of human rights, to an increase in Iran's crude oil revenues, or to connecting the Central Bank of Iran or a designated Iranian financial institution to the international financial system; and

(3) Whether the transaction(s), financial services, or financial transaction supports humanitarian activity or involves the payment of basic expenses as specified in and authorized pursuant to UNSC Resolution 1737 or the payment of extraordinary expenses that have been authorized by the Sanctions Committee established pursuant to UNSC Resolution 1737, or the payment for the sale of food, medicine, or medical devices to Iran.

(f) *Deceptive practices:* Whether the transaction(s), financial services, or financial transaction involves an attempt to obscure or conceal the actual parties or true nature of the transaction(s), financial services, or financial transaction or to evade sanctions; for example, whether the transaction enabled the Central Bank of Iran to facilitate the evasion of sanctions by a blocked person described in §561.201(a)(5) or a designated Iranian financial institution, as defined in §561.324.

(g) *Central Bank of Iran Reserves, Settlement Services, Foreign Currency Exchanges, and Official Development Assistance Repayment:* Other factors involved in making a determination of whether a transaction(s), financial service, or financial transaction is significant are whether the transaction solely involves the passive holding of Central Bank of Iran reserves by a foreign financial institution; whether the Central Bank of Iran's role is limited to providing settlement services or foreign currency exchanges in transactions between a non-designated Iranian financial institution and a foreign financial institution; and whether the transaction involves only the repayment of official development assistance by the Central Bank of Iran or the transfer of funds required as a condition of Iran's membership in an international financial institution.

(h) *Other relevant factors.* Such other factors that the Secretary deems relevant on a case-by-case basis in determining the significance of a transaction(s), financial services, or financial transaction.

[77 FR 11726, Feb. 27, 2012, as amended at 78 FR 16409, Mar. 15, 2013; 84 FR 38548, Aug. 7, 2019]

⮤ Back to Top

§561.405 Entities owned by a person whose property and interests in property are blocked.

A person whose property and interests in property are blocked pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) has an interest in all property and interests in property of an entity in which it owns, directly or indirectly, a 50 percent or greater interest. The property and interests in property of such an entity, therefore, are blocked, and such an entity is a person whose property and interests in property are blocked pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*), regardless of whether the entity itself is listed on the Office of Foreign Assets Control's Specially Designated Nationals and Blocked Persons List.

⮤ Back to Top

§561.406 Country with primary jurisdiction over the foreign financial institution.

For purposes of §561.203(i) and §561.204(f), a country includes any jurisdiction that has its own central bank or contains a separate financial sector authority, and a foreign financial institution (including its foreign branches outside of the United States) is under a country's primary jurisdiction if the foreign financial institution is organized under the laws of the country or any jurisdiction within that country.

⮤ Back to Top

§561.407 Conducting or facilitating a financial transaction with the Central Bank of Iran or a designated Iranian financial institution.

A foreign financial institution conducts or facilitates a financial transaction with the Central Bank of Iran or a designated Iranian financial institution if it maintains an account for such entities or engages in a financial transaction directly or indirectly with such entities.

NOTE TO §561.407: See §561.404 for factors that may be considered in determining whether a financial transaction is significant, as required for the imposition of certain sanctions pursuant to this part.

⮤ Back to Top

§561.408 Goods or services originating in a country.

(a) Goods originating in a country are goods that have been grown, produced, manufactured, extracted, or processed, and goods that have been substantially transformed, in the country.

(b) Services originating in a country are services performed in that country or services performed in the country to which the services are being exported by a citizen, national, or permanent resident of the country from which the services originate who is ordinarily resident in that country.

(c) For purposes of this part, services originating in a country do not include the brokering of transactions for the sale and exportation of goods or services not originating in that country.

RATIONALE OF BANK EXAMINATIONS

The Federal Deposit Insurance Corporation conducts bank examinations to ensure public confidence in the banking system and to protect the Deposit Insurance Fund. Maintaining public confidence in the banking system is essential because customer deposits are a primary funding source that depository institutions use to meet fundamental objectives such as providing financial services. Safeguarding the integrity of the Deposit Insurance Fund is necessary to protect customers' deposits and resolve failed banks.

Onsite examinations help ensure the stability of insured depository institutions by identifying undue risks and weak risk management practices. Examination activities center on evaluating an institution's capital, assets, management, earnings, liquidity, and sensitivity to market risk. Evaluating a bank's adherence to laws and regulations is also an important part of bank examinations and is given high priority by Congress and bank supervisors.

Finally, bank examinations play a key role in the supervisory process by helping the FDIC identify the cause and severity of problems at individual banks and emerging risks in the financial-services industry. The accurate identification of existing and emerging risks helps the FDIC develop effective corrective measures for individual institutions and broader supervisory strategies for the industry.

CONDUCT OF EXAMINATIONS

Given the fundamental reasons for conducting examinations, regulatory personnel must have access to all records and employees of a bank during an examination.

Sections 10(b) and (c) of the Federal Deposit Insurance Act (FDI Act) empower examiners to make a thorough examination of a bank's affairs. Examiners should contact their regional office for guidance if faced with serious impediments to an examination, including uncooperative executive officers, or restricted access to bank employees or records. The regional office will determine an appropriate solution to enable examiners to obtain the information needed to complete the examination. In such cases, examiners should document all significant examination obstacles and the regional office's resolution of the situation.

Prohibition Against Political Communication

FDIC employees should avoid any form of political communication with insured depository institutions that could be perceived as suggesting the examination process is influenced by political considerations, or that the bank should take a particular position on legislative issues. Examinations must be kept free from political considerations, or the appearance of being influenced by political considerations, in order to maintain the integrity and effectiveness of the examination process. FDIC employees should promptly inform their regional office of any situation they feel compromised this policy.

←

RATING SYSTEM

Introduction

The Uniform Financial Institutions Rating System (UFIRS) was adopted by the Federal Financial Institutions Examination Council (FFIEC) on November 13, 1979, and updated in December 1996. Over the years, the UFIRS proved to be an effective supervisory tool for evaluating financial institutions on a uniform basis and for identifying institutions requiring special attention. Changes in the banking industry and regulatory policies prompted a revision of the 1979 rating system. The 1996 revisions to the UFIRS include the addition of a sixth component addressing sensitivity to market risk, the explicit reference to the quality of risk management processes in the management component, and the identification of risk elements within the composite and component rating descriptions.

The UFIRS takes into consideration certain financial, managerial, and compliance factors that are common to all institutions. Under this system, the supervisory agencies endeavor to ensure all financial institutions are evaluated in a comprehensive and uniform manner, and that supervisory attention is appropriately focused on institutions exhibiting financial and operational weaknesses or adverse trends.

The UFIRS also serves as a useful vehicle for identifying institutions with deficiencies in particular component areas. Further, the rating system assists Congress in assessing the aggregate strength of the financial industry and following risk management trends. As such, the UFIRS assists regulatory agencies in fulfilling their mission of maintaining stability and public confidence in the nation's financial system.

UFIRS Overview

Under the UFIRS, each financial institution is assigned a composite rating based on an evaluation of six financial and operational components, which are also rated. The component ratings reflect an institution's capital adequacy, asset quality, management capabilities, earnings sufficiency, liquidity position, and sensitivity to market risk (commonly referred to as CAMELS ratings). When assigning ratings, examiners consider an institution's size and sophistication, the nature and complexity of its activities, and its general risk profile.

Composite and component ratings are assigned based on a numerical scale from 1 to 5, with 1 indicating the highest rating, strongest performance and risk management practices, and least degree of supervisory concern. A 5 rating indicates the lowest rating, weakest performance and risk management practices, and highest degree of supervisory concern.

A bank's composite rating generally bears a close relationship to its component ratings. However, the composite rating is not derived by averaging the component ratings. Each component rating is based on a qualitative analysis of the factors composing that component and its interrelationship with other components. When assigning a composite rating, some components may be given more weight than others depending on the situation at an institution. In general, assignment of a composite rating may incorporate any factor that bears significantly on the overall condition of the financial institution. Composite and component ratings are disclosed to an institution's board of directors and senior management. However, banks cannot, except in very limited circumstances, disclose the ratings or any part of a report of examination (ROE) without the prior written consent of their primary federal regulator.

Management's ability to respond to changing circumstances and address risks that result from new business conditions, activities, or products is an important factor in determining an institution's risk profile and the level of supervisory concern. For this reason, the management component is given special consideration when assigning a composite rating.

The ability of management to identify and control the risks of its operations is also taken into account when assigning each component rating. All institutions should properly manage their risks; however, appropriate management practices vary considerably among financial institutions depending on their size, complexity, and risk profile. Less complex institutions that are engaged solely in traditional banking activities and whose directors and senior managers are actively involved in the oversight and management of day-to-day operations may use relatively basic risk assessment, risk management, and internal control systems. Institutions that are more complex need formal, multifaceted systems and internal controls to provide the information managers and directors need to monitor and direct higher risk activities.

Consumer Compliance, Community Reinvestment Act, and specialty examination findings and ratings are also taken into consideration, as appropriate, when assigning component and composite ratings under the UFIRS. Specialty examination areas include: Bank Secrecy Act, Information Technology (IT), Trust, Government Security Dealers, Municipal Security Dealers, and Registered Transfer Agent.

An addendum at the end of this section contains definitions and descriptions of the UFIRS composite and component ratings.

Disclosure of Ratings

The FDIC believes it is appropriate to disclose the UFIRS component and composite ratings to bank management. Disclosure of the UFIRS ratings helps ensure banks implement appropriate risk management practices by allowing a more open and complete discussion of examination findings and recommendations.

Additionally, open discussion of the CAMELS ratings provides institutions with a better understanding of how ratings are derived and enables management to better address weaknesses in specific areas.

Discussions with Management

Generally, the examiner-in-charge (EIC) should discuss the recommended component and composite ratings with senior management and, when appropriate, the board of directors, near the conclusion of the examination. Examiners should clearly explain that their ratings are tentative and subject to the review and final approval by the regional director or designee. Examiners should follow regional guidance regarding the disclosure of component and composite ratings of 3 or worse. Generally, in these situations, examiners should contact the regional office overseeing the institution and discuss the proposed ratings with the case manager or assistant regional director prior to disclosing the ratings to management or the board.

Examiners should discuss the key factors they considered when assigning component and composite ratings with management and the board. Examiners should also explain that the composite rating is not based on a numerical average but rather a qualitative evaluation of an institution's overall managerial, operational, and financial performance.

The management component rating may be particularly sensitive and important. The quality of management is often the single most important element in the successful operation of an insured institution. It is usually the factor most indicative of how well risk is identified and controlled. For this reason, examiners should thoroughly review and explain the factors considered when assigning the management rating. Written comments in support of the management rating should include an assessment of the effectiveness of existing policies and procedures in identifying and managing risks.

Examiners should remind management that all examination findings, including the composite and component ratings whether disclosed verbally or in the written ROE, are subject to the confidentiality rules imposed by Part 309 of the FDIC Rules and Regulations.

The regional office should inform management if there are material processing delays or substantive changes to the ROE that modify the preliminary examination findings or recommendations disclosed at examination exit meetings.

Examination Letters

The FDIC's expectations for troubled institutions should be clearly communicated to bank management between the close of an examination and the issuance of an enforcement action. An examination letter should be delivered by FDIC field supervisors to chief executive officers/presidents during examination exit meetings, or earlier, for any bank newly assigned a CAMELS composite 3 rating or worse.

Examination letters should notify management that the institution's composite rating was tentatively downgraded and convey the expectation that management stabilize the institution's risk profile and strengthen its financial condition. The letter should notify management that actions taken to materially expand the institution's balance sheet or risk profile are inconsistent with supervisory expectations. The letter should also inform management they are required to obtain a non-objection from the regional director before engaging in any transactions that would materially change the institution's balance sheet composition, such as significantly increasing total assets or volatile funding sources. If practical, state banking departments should be included as a joint issuer of examination letters relating to FDIC-supervised examinations. Furthermore, an examination letter should be arranged if a downgrade is anticipated due to a state examination.

Immediate corrective measures, including the issuance of a temporary order requiring an institution to cease and desist, may be appropriate in higher-risk situations. If examiners believe such action should be considered, they should discuss the situation with the field supervisor and regional case manager without delay.

EXAMINATION FREQUENCY

The first priority of the Division of Risk Management Supervision (RMS) is the effective oversight of banks requiring special attention. The identification and supervision of banks requiring special attention is best accomplished through the examination process.

Section 337.12 of the FDIC Rules and Regulationsimplements Section 10(d) of the FDI Act and governs the frequency of examinations for insured state nonmember banks and state savings associations. Section 347.211 governs the examination frequency of branches of foreign banks.

Section 337.12 requires a full-scope, onsite examination of every insured state nonmember bank and state savings association at least once during each 12-month period. Annual examination intervals may be extended to 18 months under the following conditions:

- The bank has total assets of less than $3 billion;
- The bank is well capitalized as defined in Section 324.403(b)(1) of the FDIC Rules and Regulations;
- The bank was assigned a management component rating of 1 or 2 at the most recent FDIC or applicable state examination;
- The bank was assigned a composite rating of 1 or 2 at the most recent FDIC or applicable state examination;
- The bank currently is not subject to a formal enforcement proceeding or order by the FDIC, OCC, or Federal Reserve System; and
- No person acquired control of the bank during the preceding 12-month period in which a full-scope, onsite examination would have been required but for the above noted exceptions.

These rules apply similarly to U.S. branches or agencies of a foreign bank with total assets less than $3 billion if the office received a composite Federal Reserve ROCA[1] rating of 1 or 2 at its most recent examination. In all cases, the FDIC reserves the right to examine more frequently if the agency deems it necessary.

The FDIC strives to conduct risk management and specialty examinations of all state nonmember banks within prescribed intervals. If examination frequency requirements, other than a few nominal and non-recurring exceptions, cannot be met, regional directors should prepare and submit a memorandum to the Director of RMS. The memorandum should include a description of the nature and cause of the situation and a description of any needed, planned, or implemented corrective measures designed to maintain an adequate supervision program.

Alternate Examinations

Examinations may be conducted in alternate 12- or 18-month periods if the FDIC determines that a full-scope, onsite examination completed by the appropriate state supervisory authority during the interim period is acceptable. However, such alternate examinations should be accepted only for the following institutions: composite 1- or 2-rated institutions, and stable and improving composite 3-rated institutions if the composite rating is confirmed by an offsite review and no adverse trends are noted from other available information. The length of time between the end of one examination and the start of the next (whether one or both of the examinations are conducted by a state supervisory agency or the FDIC) should not exceed 12- or 18-months.

For purposes of monitoring compliance with examination frequency schedules, the end of the examination is defined as the earlier of the date the EIC submits the report for review, or 60 calendar days from the examination start date as defined in the Report of Examination Instructions.

Specialty Examination Intervals

The statutory requirements in Section 10(d) of the FDI Act do not apply to specialty examinations. Thus, specialty examinations are governed by internal RMS policy. Specialty examinations should generally be conducted concurrently with risk management examinations, except when the size or arrangement of a department makes it impractical or inefficient to do so. Although there will be some differences, specialty examinations are generally subject to the same examination intervals, including appropriate extensions, as risk management examinations.

In situations where rating differences or alternate state examinations result in examination intervals that are not conducive to scheduling concurrent examinations, regional directors can make reasonable adjustments to specialty examination intervals to accommodate concurrent examinations. Reasonable adjustments include extending the examination cycle for 1- and 2-rated specialty areas. Although not permitted by statute for safety and soundness examinations, internal policy allows regional directors to extend the examination cycle for 3-rated specialty areas. Specialty areas rated 4 or 5 should normally not be extended beyond a one-year interval. Additionally, since Municipal Securities Dealers are subject to a two-year examination cycle under Municipal Securities Rulemaking Board rules, any adjustment in this area should not exceed the two-year requirement. The possibility of conducting specialty examinations with state authorities should be explored if reasonable adjustments can be made.

When the state supervisory authority has responsibility for conducting the safety and soundness examination, the FDIC is not required to conduct any specialty examinations that the state authority does not conduct, with the exception of Bank Secrecy Act (BSA) examinations. The FDIC is required to conduct a BSA examination if the state does not conduct a BSA examination.

Insured Branches of Foreign Banks

Insured branches of foreign banks must be examined every 12 months under Section 10(d) of the FDI Act. However, Section 347.211 of the FDIC Rules and Regulations specifies that domestic branches of foreign banks may be considered for an 18-month examination cycle when certain criteria are met and no other factors suggest more frequent examinations are necessary. To be eligible for an extended 18-month examination cycle, a U.S. branch of a foreign bank must:

- Have total assets of less than $3 billion;
- Have a composite ROCA supervisory rating of 1 or 2 at its most recent examination;
- Not be subject to a formal enforcement action;
- Not have undergone a change in control during the preceding 12 months; and
- Have Tier 1 and total risk-based capital ratios (at the foreign bank) of at least 6 percent and 10 percent, respectively, when reported on a consolidated basis; or

1 The ROCA components are: Risk management, Operational controls, Compliance, and Asset quality.

- Have maintained on a daily basis (over the previous three quarters) eligible assets in an amount not less than 108 percent of the preceding quarter's average third-party liabilities, and have sufficient liquidity currently available to meet its obligations to third parties.

Additional factors may also be considered in determining examination frequency, including certain discretionary standards outlined in Section 347.211.

EXAMINATION TYPES

Risk-Focused Supervision

Effective risk management is central to safe and sound banking. The objective of a risk-focused examination is to efficiently evaluate the safety and soundness of a bank. Examiners should focus their resources on a bank's high-risk areas when assessing risk management programs, financial conditions, internal controls, etc. The exercise of examiner judgment to determine the scope and depth of review in each functional area is crucial to the success of the risk-focused supervisory process. Examiners should make risk-scoping decisions on a case-by-case basis in consultation with their supervisory examiner, field supervisor, or the bank's case manager.

The most effective examination approach focuses examiner resources on assessing management's ability to identify and control risks. Internal and external audits, loan reviews, and other control activities are integral considerations in an assessment of a bank's risk profile. Refer to the Internal Routine and Controls section of this Manual for an in-depth discussion of this area.

Examiners should consider the adequacy of audit and control practices in determining a bank's risk profile and, when appropriate, try to reduce regulatory burdens by testing rather than duplicating the work of a bank's audit and control functions. Transaction testing remains a reliable and essential examination technique for use in the assessment of a bank's condition. However, the amount of transaction testing necessary to evaluate activities generally depends on the quality of the bank's risk management processes. Once the integrity of the bank's risk management system is verified through testing, conclusions regarding the extent of risks within an activity can often be based on the results of internal reports rather than in-depth, onsite assessments.

The FDIC's long-standing philosophy and methods for examining institutions are fully described within this manual in Section 20.1 Risk-Focused, Forward-Looking Safety and Soundness Supervision. Examiners are expected to conduct examination activities consistent with Section 20.1.

Full-Scope Examinations

The minimum requirements of a full-scope examination are defined as the procedures necessary to complete the mandatory pages of the uniform ROE and evaluate all components (Capital, Asset Quality, Management, Earnings, Liquidity, and Sensitivity to Market Risk) of the UFIRS rating system. The completion of additional steps and pages may also be appropriate.

In a full-scope examination, all examination activities are considered in the overall assessment of the institution. These activities include the Risk Management, IT, BSA/Anti-Money Laundering (AML)/ Office of Foreign Assets Control, Trust, Registered Transfer Agent, Municipal Securities Dealer, and Government Securities Dealer examination programs. Examination ratings (when assigned) and summary comments should be included in the risk management ROE. Compliance and Community Reinvestment Act examination activities are included in the overall supervision program with separate reports and examination cycles.

Limited-Scope Examinations and Visitations

The terms *limited-scope examination* and *visitation* are interchangeable and may be defined as any review that does not meet the minimum requirements of a full-scope examination. Because the reviews are not full-scope examinations, they do not satisfy the requirements of Section 10(d) of the FDI Act. Examiners may conduct the reviews for a variety of reasons, such as to assess changes in an institution's risk profile or to monitor compliance with corrective programs. Examiners may also conduct the reviews to investigate adverse or unusual situations, to determine progress in correcting deficiencies, or to assess compliance with supervisory requirements established through an order.

Limited-scope reviews may address the overall condition of the institution, material changes since the previous examination, or areas that exhibit more than normal risk. Depending on the scope, purpose, and sufficiency of the reviews, examiners can assign composite ratings and component ratings. Component ratings for areas that were not sufficiently reviewed should be brought forward from the previous examination.

Examiners are not required to complete standard ROE schedules when completing limited-scope reviews. However, they may include applicable schedules in their report to clarify findings or recommendations. Results should generally be conveyed in a memorandum from the EIC to the regional director. The results of a review, if sent to the institution, can be in any appropriate format.

Institutions Subject to Corrective Actions

Supervisory strategies for institutions operating under an enforcement action, particularly formal actions, should generally include limited-scope reviews. The onsite reviews should include an evaluation of management's understanding of, and adherence to, the provisions of the corrective program. Limited-scope reviews should be scheduled within six months after an enforcement action is issued to evaluate an institution's progress in implementing the corrective program. Particular attention should be focused on the primary cause of the institution's problems and the principal objectives of corrective programs. If a decision is made to forego or delay an interim onsite review, the reasons should be documented in regional office files.

Newly Chartered Insured Institutions

Adverse economic conditions and other factors often affect newly chartered institutions more than established institutions, and the failure rates of de novo institutions exceed those of established institutions. Therefore, unseasoned institutions pose a material risk to the Deposit Insurance Fund (DIF) and warrant close regulatory oversight.

Among noted concerns, de novo institutions that deviate from approved business plans, especially with respect to real estate and development loans, are of particular concern to supervisory personnel. Other, common risk factors observed at troubled or failed de novo institutions during their first three years of operation include:

- Non-compliance with orders approving deposit insurance,
- Inadequate risk management controls,
- Rapid growth,
- Concentrations in higher risk assets,
- Over reliance on volatile funding sources,
- Problematic third-party relationships,
- Weak compliance management systems, and
- Unseasoned loan portfolios.

In all cases, major deviations from, or material changes to, approved business plans by newly insured institutions warrant in-depth analysis to assess risks to the institution and the DIF. In order to better identify risks and strengthen supervisory responses to identified risks, supervisory personnel should:

- Employ appropriate onsite and offsite supervisory practices;
- Carefully coordinate risk management, compliance, and interagency activities;
- Monitor activities, at least quarterly, for changes to, or deviations from, established business plans; and
- Clearly define expectations to management regarding the timing, type, and documentation required to satisfy supervisory monitoring activities.

Orders granting federal deposit insurance require bank management to seek prior approval for any major deviation, or material change, from the institution's approved business plan. To ensure that this requirement is met, the board should monitor the institution's performance for early signs that correction is needed or that a request for a change in business plan is necessary.

If a major deviation or material change to approved business plans is identified by the FDIC during an examination or other review, the case manager or examiner-in-charge should document the deviation/change in a memorandum to the regional director and include an assessment of the riskiness of the deviation/change. In such circumstances, prompt communication to bank management is necessary, and proactive, supervisory action is appropriate.

Examination and Visitation Cycles

If a newly chartered and insured institution is a subsidiary of a multi-bank holding company that is in satisfactory condition, normal examination cycles should be followed at the regional director's discretion; otherwise, a limited-scope examination should be conducted within the first six months of operation and a full-scope examination within the first twelve months of operation. Subsequent to the first examination and through the third year of operation, at least one examination should be performed each year. Extended examination intervals should not be applied in the first three years of operation. After the initial full-scope examination, examinations may be alternated with the state supervisory authority.

Monitoring Activities

During the three-year de novo period, examiners should emphasize the need for management to seek prior approval for any proposed material change(s) from the approved business plans. Regional offices have a responsibility to monitor de novo institutions' activities, review compliance with any conditions of deposit insurance orders, and track performance in relation to approved business plans. Significant changes to business plans must be submitted to the appropriate regional office for approval. Examiners assist in monitoring activities by:

- Conducting general visitation and examination procedures,
- Assessing institutions' overall risk profiles and management capabilities,
- Reviewing institutions' conformity with business plans,
- Evaluating compliance with any outstanding conditions, and
- Documenting their findings in reports of examination.

Changes in Business Plans

There is a significant degree of judgment involved in determining a major deviation or material change in a business plan. Such changes may be evidenced by shifts in asset or liability mix; variances in loan, deposit, or total asset volumes from original projections; or the introduction or deletion of a specific business strategy (such as the initiation of subprime lending or the gathering of brokered deposits). Business plans generally address a number of factors that include, but are not limited to:

- Geographic markets;
- Loan products and services;
- Investment strategies and levels;
- Deposit products and services;
- Other services, such as private banking or trust services;
- Liquidity strategies and funding sources;
- Delivery channels, particularly through third-party relationships;
- Fixed assets (e.g., branches/loan production offices);
- Other activities (on- or off-balance sheet), including fee-for-service activities;
- Customer categories (such as money services businesses or foreign financial institutions); and
- Relationships with parent organizations and affiliates.

State nonmember banks requesting deposit insurance must agree to obtain the prior approval of the FDIC for any material change to their business plan. Any significant change in the items listed above should generally be viewed as a material change in business plan. Such changes may be evidenced by significant (+/- 25 percent) deviation in asset growth projections; changes in the asset/liability mix or products and services offered; or the introduction of new business strategies such as an unplanned establishment of loan production offices or use of third parties to broker, underwrite, or originate credit on behalf of the institution.

Converting to Insured Nonmember Status

A full-scope examination should be conducted within twelve months of the last examination prior to conversion for national, state member, and thrift institutions. For noninsured institutions converting to insured status, a full-scope examination should be conducted within twelve months of the last examination prior to conversion. If the last examination was conducted by the state authority, the regional director has the discretion to accept it. However, such an examination should be accepted only for institutions rated composite 1 or 2.

Change of Ownership Control

A full-scope examination should be conducted within twelve months after a change of control. Thereafter, standard examination intervals apply.

COORDINATING EXAMINATION SCHEDULES

State Authorities

Every effort should be made to coordinate examination schedules with state authorities to take advantage of state resources, to minimize duplications of effort, and to lessen business disruptions to institutions. A representative of the regional office should meet with representatives from each state banking authority to determine examination responsibilities for the upcoming year. Responsibilities may be defined by ratings, size, or location of institutions, or assigned by specific institutions as deemed appropriate. Such agreements should contain flexibility to allow either party to alter schedules with minimal notice. While state examination requirements should be considered in the coordination process, state requirements should not be the determining factor in the final agreement.

Holding Company Inspections and Subsidiary Institution Examinations

Examinations of holding company subsidiaries should be coordinated with other federal agencies whenever possible. Particular emphasis for coordinating examinations should be placed on banking organizations with over $10 billion in consolidated assets and those banking organizations (generally with assets in excess of $1 billion) that exhibit financial weaknesses.

Examinations and inspections of insured subsidiary banks and bank holding companies that do not meet the foregoing criteria should be coordinated to the extent practical. Regional directors (or designees) should meet periodically with representatives from other federal agencies to develop coordinated schedules that will maximize the use of available resources and enhance the efficiency of bank examinations and bank holding company inspections. The coordination of examination and inspection activities should, when possible, focus on the use of common financial statement dates and allow for joint discussions with management. However, absolute concurrence, common as-of dates, and simultaneous starting dates are not required. Appropriate state regulatory agencies should be kept informed and encouraged to participate in the coordinated federal efforts affecting state-chartered institutions.

Examinations of nonbank affiliates may be conducted at the discretion of the regional director, but independent examinations of holding companies supervised by the Federal Reserve may not be conducted without prior approval of the Washington Office.

Interstate Banking and Chain Banks

A coordinated supervisory strategy for interstate banking organizations (both intra- and inter-regional) should be developed. The supervisory strategy developed should combine traditional supervision of individual units with an appropriate top-down approach to assess risks and to monitor and coordinate supervisory actions. For these organizations, the regional director has discretion to omit, delay, or modify existing examination frequencies if the financial condition of the holding company and lead bank is considered satisfactory; the condition of the subsidiary units is believed to be satisfactory; control over all insured banks in the organization is effectively centralized; and management is favorably regarded.

Regional directors are responsible for designating a lead region to design an appropriate supervisory strategy for interstate banking organizations and for ensuring pertinent information is conveyed in a timely manner to other regions and to appropriate federal and state agencies.

Chain banking organizations generally involve a group of financial institutions or holding companies that are controlled by one individual or company. Regional directors are responsible for maintaining a record system for chain banking organizations and for developing an overall supervisory strategy for these organizations. RMS policy is to supervise banks that are part of a chain banking organization in a manner that considers the financial impact of the consolidated chain on the individual institutions within that chain. Refer to Section 4.3, Related Organizations for additional details on, and a full description of, chain banking organizations.

←

SCHEDULING GUIDELINES

Periodic onsite examinations are critical to the supervisory process and are an integral part of the examination program. Diversified risks in the industry and the volatile performance and financial condition of individual institutions necessitate emphasis on more frequent and less-structured supervision. Investigations, phone calls, emails, limited-scope examinations, correspondence, and other forms of customized contact should be made as necessary. The purpose is to identify and obtain corrections in an institution's policies and procedures before serious financial problems develop.

Examination planning activities should include efforts to determine the activities and condition of nonbank subsidiaries. If not determinable in advance, this information should be obtained early in the examination in order to assess the necessity for, and depth of, subsidiary examinations.

A major component of the risk-focused supervisory approach is the flexibility to conduct examination activities at various times during the examination cycle based on risk or staffing considerations. However, it is anticipated that most examination activities will be conducted as of a single point-in-time near the end of the risk management examination cycle, particularly in well-rated institutions.

Forward-Looking Supervision

Risk-focused supervision employs a forward-looking supervisory approach where control weaknesses or other risk management conditions or problems are assessed early, and when necessary, corrected, in order to prevent or mitigate serious problems to an institution's financial condition in the future.

To address minor issues identified during an examination, examiners may present suggestions to management during discussions. For more significant problems, examiners should discuss the deficiencies with management and the board of directors during the examination and at subsequent exit meetings, and address the problems in the ROE. Such discussions and written commentary should clearly convey the issue that is cause for concern and explain the risks to the institution's operations or financial performance if not addressed in a timely manner. Significant issues that require immediate attention should be identified as Matters Requiring Board Attention in the ROE. If circumstances warrant and after discussing with appropriate FDIC regional management, examiners should make recommendations for informal or formal agreements or actions if they identify unacceptable risk levels or risk management practices, even in 1 or 2 rated institutions.

A forward-looking supervisory approach that identifies and seeks to correct objectionable conditions requires serious thought and a balanced response by examiners. Critical comments must be well supported and based on facts, logic, and prudent supervisory standards. Although examiners cannot predict future events, they should consider the likelihood that identified weaknesses will cause material problems in the future, and consider the severity of damage to an institution if conditions deteriorate. In circumstances where formal action is considered, examiners should consult with the regional office while the examination is in progress regarding the material needed to support a potential action.

Scheduling Considerations

The success of a risk-focused examination program depends largely on the effectiveness of examination planning efforts and assignment scheduling. The objective of a risk-focused examination process is to identify problems early and devise solutions in the quickest, most efficient manner possible. In some instances, evidence of objectionable practices or conditions may indicate the need for an accelerated examination or visitation. In less severe situations, the information is retained and factored into the scheduling of future examinations.

In order for examiners to proactively assess potential deficiencies, it is critical for field supervisors and other personnel to be aware of, and have access to, pertinent documentation. Regional directors should ensure copies of relevant correspondence and other information that may affect scheduling decisions is documented and made available to scheduling personnel.

The following lists include sources of information that may influence examination schedules or activities. In some instances, the information may identify concerns that lead to immediate examinations. In less severe situations, the information may help identify risks that require follow-up or impact the scheduling of future examinations. The lists, while not all-inclusive, highlight the need for forward-looking supervision.

Offsite Analysis and Monitoring

- Statistical CAMELS Offsite Rating System
- Comprehensive Analytical Reports
- Interim Financial Reports
- Growth Monitoring System
- UBPR Analysis
- Press Releases

Other Financial Indicators

- Unusually high or fluctuating profit levels
- Significant operating losses
- Significant provision expenses to the allowance for loan and lease losses (ALLL) or allowance for credit losses (ACL), as applicable
- Significant levels of delinquent loans
- Significant changes in balance sheet composition
- Unusually elevated or rapidly growing asset concentrations
- High reliance on brokered funds
- Excessive trading
- Excessive dividends
- Unusually high or low ratios or numbers

Applications or Other Bank-Provided Data

- Merger activity
- Large defalcation
- Change of control
- Adverse audit report findings
- Newly insured institution
- Change in external auditor
- New subsidiaries or business lines
- Cancellation of blanket bond insurance
- Exercise of a new power or profit center
- Acquiring party in an FDIC-assisted transactions
- Large paydown/payoff of previously classified loans
- Affiliation with a problem institution/holding company

Known Characteristics

- Unusually high or low salaries
- Compensation linked to financial-performance metrics
- Significant litigation
- Infighting among officers or directors
- Officers or directors with past due loans
- Dominating or self-serving management
- Operating at the margin of laws and regulations
- Inexperienced or questionable management
- Substantial outside business interests of a key officer

- Conducting business with questionable firms
- Lack of diversity in business lines
- Higher-risk business strategies
- Refinancing poor quality loans
- Advertising above-market interest rates
- Large blocks of bank stock pledged as collateral
- Numerous or unusual affiliated loan participations
- Improper handling of correspondent bank accounts
- Sacrificing price or quality to increase loan volumes
- Hiring of a dismissed, unethical, or marginal officer

Other Bank Regulators

- Improper handling of correspondent bank accounts
- Increased or unusual loan participations among affiliated or closely-held institutions
- Large blocks of stock pledged as collateral
- Affiliation with an institution or holding company rated 3, 4, or 5
- Large defalcation
- Banker with past due loans at another institution
- Loans classified at other institutions

Media

- New chief executive officer or chief lending officer
- Adverse publicity
- Annual or interim period losses
- Adverse economic event in a community
- Natural disaster such as a flood, fire, or earthquake
- Large defalcation
- Large financial commitment as sponsor or lead bank in a major project or development
- Banker death or disappearance
- Announcement of major new activity or department

Observations/Other

- Change in external auditor
- High or sudden employee turnover
- Significant litigation against the institution or insiders
- Unusual activity in stock of the institution (price movement up or down, or heavy trading volume)
- Institution advertising above-market rates
- Significant change in asset/liability compositions
- Questionable loans being booked
- Relationships with borrowers of questionable character
- Confidential or anonymous tips

RELYING ON STATE EXAMINATIONS

Section 10(d)(9) of the FDI Act requires the FFIEC to issue guidelines establishing standards for the purpose of determining the acceptability of state reports of examination. Under Section 10(d)(3-4), a federal banking agency may conduct an annual, onsite examination of an insured depository institution in alternate 12- or 18-month periods if the agency determines that a state examination conducted during the intervening period is adequate. The standards issued by the FFIEC are to be used at the discretion of the appropriate federal banking agency.

The FDIC and the Federal Reserve Board of Governors have a history of coordinating examination activities with state banking departments. This close cooperation improves the supervisory process by promoting a safe and sound banking system, maximizing examination efficiencies, and reducing the regulatory burden on state-chartered, depository institutions.

The federal and state banking agencies have worked together in the following areas:

- Conducting alternate, joint, and concurrent examinations of insured depository institutions, and of the branches and agencies of foreign banks that have been chartered by the states;
- Processing safety and soundness examination reports and applications on a timely basis;
- Using common examination report and application forms;
- Developing and issuing informal (e.g., board resolutions, memoranda of understanding or other similar agreements) and formal enforcement actions;
- Exchanging supervisory information;
- Offering federal agency training programs to state examiners; and
- Providing access to the federal agency databases.

The FDIC intends to continue these cooperative efforts to the maximum extent possible. It is recognized, however, that the adequacy of state budgeting, examiner staffing, and training are important factors to enhancing federal and state coordination. The FDIC has entered into formal and informal arrangements with most state banking departments. These arrangements or working agreements generally address the following areas:

- The number of state-chartered, insured institutions to be examined on an alternating basis by the state banking department and by the FDIC;
- The frequency of safety and soundness examinations;

- The type of examinations to be conducted (independent, joint, or concurrent) by each agency;
- The examination procedures to be performed;
- The responsibilities of each agency for processing reports of examination;
- The responsibilities of each agency for conducting specialty examinations;
- The procedures for coordinating informal and formal enforcement actions;
- The procedures for processing joint applications; and
- The procedures for sharing supervisory information.

These arrangements are structured to permit federal and state agencies flexibility in conducting independent examinations, subject only to notification to the other party. The flexibility allows the agencies to tailor activities based on the particulars of each state and the individual banks within a state. Generally, only institutions rated 1 or 2 are examined on an alternating basis allowing for a reasonable interval between examinations.

The FDIC will accept and rely on state reports of examination in all cases in which it is determined that state examinations enable the FDIC to effectively carry out its supervisory responsibilities. The following criteria may be considered, in whole or in part, when determining the acceptability of a state report of examination under Section 10(d) of the FDI Act:

- The completeness of the state examination report. The state report of examination should contain sufficient information to permit a reviewer to make an independent determination on the overall condition of the institution as well as each component factor and composite rating assigned under the UFIRS and commonly referred to as the CAMELS rating system, or the ROCA rating system used for branches and agencies of foreign banks.
- The adequacy of documentation maintained by state examiners to support observations made in examination reports.
- The ability over time of a state banking department to achieve examination objectives. At a minimum, the FDIC will consider the adequacy of state budgets; examiner staffing and training; and examination reports, reviews, and follow-up procedures. Accreditation of a state banking department by the Conference of State Bank Supervisors will also be considered.
- The adequacy of any formal or informal arrangement or working agreement between a state banking department and the FDIC.

The FDIC, as part of its routine review of state examination reports, will assess the quality and scope of the reports to determine whether they continue to meet the general criteria noted above. The FDIC retains the option to conduct a follow-up examination in cases in which a state examination report appears insufficient or the condition of an insured institution appears to be seriously deteriorating.

If a state and the FDIC have cooperative examination programs, regional directors may involve FDIC examiners in state examinations if an institution's condition is deteriorating, or areas of concern are identified.

The FDIC will work with state banking departments to resolve any concerns regarding the acceptability of each other's work, the operation of cooperative programs, or any other issues of mutual interest.

←

COMMUNICATION BETWEEN EXAMINATIONS

Interim contact with bank management is a critical form of communication and should be conducted within 30 days of the midpoint between risk management examinations (FDIC or state). Interim contacts provide a way to monitor the institution's financial condition and gather insight into trends regarding the nature, scope, and risk of an institution's activities. Interim contacts also help supervisory staff (including examiners) establish an appropriate examination scope and identify resources required for the next examination.

The objective of an interim contact is to build and maintain effective communication with the institution. The contacts provide an opportunity for management to discuss financial trends, strategic initiatives, developing risks, and regulatory changes that may affect the institution. The contacts also help identify changes in the bank's risk profile that may require an alteration in supervisory strategies. Supervisory staff can conduct interim contacts by phone or in person, depending on the matters to be discussed and travel proximity.

Information derived from interim contacts and supervisory activities can be used as part of the risk-focused examination process. The process seeks to strike an appropriate balance between evaluating the condition of an institution at a certain point in time and evaluating the soundness of the institution's risk management processes in all phases of the economic cycle. Given the purpose of this communication, the staff conducting the interim contact should coordinate with state supervisory counterparts who may also have interim contact procedures. Staff is also encouraged to share information with state banking departments if significant items are identified during contacts.

Because case managers and other supervisory staff contact institutions that are under a supervisory action periodically between examinations, only institutions with Risk Management and specialty examination composite ratings of 1 or 2 require an "interim" contact. Regional directors have the discretion to designate regional- or field-office staff to be responsible for contacting bank management. A brief file memorandum summarizing the contact should be prepared and entered into the correspondence file as an *Interim Bank Contact*. The memo is an important, formal record of the Corporation's supervisory efforts; comments should be brief and factual. Case managers should review the contact memorandum if they are responsible for oversight of the institution and did not perform the contact themselves.

Topics discussed during interim contacts generally focus on the nature of the institution's operations and risks. The following topics are provided for illustrative purposes.

- Significant changes in bank products or services;
- Changes in bank management or key personnel;
- Changes in the strategic plan, business plan, or operations;
- Significant trends or changes in the local economy or business conditions as detailed in publicly available information, Division of Insurance and Research data, or other means;
- Purchase, acquisition, or merger strategies;
- Changes in technology, including operational systems, or plans for new products/activities that involve new technologies;
- Financial performance and trends, particularly unfavorable factors identified during off-site analysis;
- Progress in addressing any outstanding matters requiring board attention, violations, or enforcement actions;
- Recent Financial Institution Letters, laws, rules, and regulations that may affect the institution's operations;
- Any matters that may be of interest to regulators, including significant audit or security incidents; and
- Institution management's concerns about the bank or FDIC supervisory activities.

←

Other contacts with an institution that occur near the midpoint of examinations, such as a visitation or other direct communication with institution management, may serve as the interim contact. In such cases, the system of record should be updated by case managers to indicate that an interim contact was completed via alternate means.

EXAMINATION PLANNING ACTIVITIES

Thorough examination planning is critical to the efficient completion of an examination. Effective planning helps support risk-scoping decisions in terms of work performed and areas to receive special attention. It can also help determine staffing needs in regard to the number and expertise of personnel required. Finally, it can enhance examination efficiencies and reduce disruptions at institutions.

Examiners should consider the need for branch examinations when planning examinations. The FDIC examines branch offices on an as-needed basis only, and the regional director is responsible for deciding if a branch examination is necessary. The decision to conduct a branch examination may be delegated to the field supervisor or EIC of a particular examination.

In general, examinations should reflect a comprehensive and coordinated effort between risk management and specialty examiners to assess an institution's overall risk profile. Information request letters from various functions scheduled for the upcoming examination (for example, Risk Management, Information Technology (IT), Bank Secrecy Act (BSA), and Trust examinations) should be coordinated and combined whenever practical. Examiners should take special care to tailor information request letters to the unique risk profile and business model of the institution, and remove unnecessary and redundant information from request lists.

As a general rule, field supervisors (FS) or supervisory examiners (SE) must call institution management at least 90 days ahead of the projected start date of the examination to inform them of the upcoming safety and soundness examination. The FS or SE will provide notice that profile scripts for general safety and soundness, which includes BSA, Trust (when applicable), and IT, will be sent to the institution. Exceptions to this general policy (such as no-notice examinations, which require regional director approval) may include problem institutions, situations where management and ownership of the institution are identical, or in situations where conditions appear to be deteriorating rapidly.

Supervisors should be mindful of an institution's space and personnel limitations and schedule the number of examiners working on bank premises accordingly. Additionally, throughout the examination, examiners should make every effort to conduct as many examination activities as reasonably possible offsite in order to minimize disruptions to an institution's normal business activities.

The following items, while not all-inclusive, are well suited for offsite review when the related information is available.

- Policies and procedures
- Audit plan
- Audit reports and responses
- Strategic plan
- Board and committee minutes/reports
- Financial data
- Asset-related reports and documents

An examination procedures module titled Risk Scoping Activities is included in the Examination Documentation Modules. This module identifies and lists several activities that may be completed by examiners during the examination planning process.

Reviewing External Audit Workpapers

An external audit workpaper review is intended to provide information relating to an institution's internal control environment and its financial reporting practices. Thus, a workpaper review assists examiners in determining the scope of the examination and the procedures to be applied to different areas of operations.

Examiners should review the workpapers of the independent public accountant or other auditor performing the institution's external auditing program when an FDIC-supervised institution has undergone a financial statement or balance sheet audit, and:

- Significant concerns exist regarding matters that would fall within the scope of the work performed by the institution's external auditors, or
- The institution has been, or is expected to be, assigned a UFIRS composite rating of 4 or 5.

However, when considering how best to use examination resources, examiners should exercise reasonable judgment with respect to performing an external audit workpaper review for these institutions. For example, it would be appropriate to conduct an external audit workpaper review for FDIC-supervised institutions when significant matters exist and the review is reasonably expected to provide an examination benefit. If examiners determine that a benefit would not be derived from performing an external audit workpaper review for an FDIC-supervised institution, examiners must document, and include in the examination workpapers, the reasons for not conducting the review.

Shared-Loss Agreements

A shared-loss agreement (SLA) is a contract between the FDIC and institutions that acquire failed bank assets. Under the agreements, the FDIC agrees to absorb a portion of the losses, if incurred, on specific assets (usually loans), purchased by an institution. If an institution makes recoveries on covered assets, they must reimburse the FDIC for part of the recoveries. Shared-loss agreements cover specific timeframes and are often written so the FDIC absorbs 80 percent of incurred losses (up to a stated threshold), and receives 80 percent of recoveries. To maintain loss coverage, institutions must adhere to the terms of the agreement and make good faith efforts to collect loans.

Note: The FDIC's reimbursement for losses on assets covered by an SLA is measured in relation to an asset's book value on the records of the failed institution on the date of its failure, not in relation to the acquisition-date fair value at which covered assets must be booked by an acquiring bank.

The FDIC uses different types of agreements for commercial loans and residential mortgages. Both types cover credit losses and certain related expenses. However, for commercial assets, SLAs generally cover losses for five years and recoveries for eight years. For residential mortgages, SLAs generally cover losses and recoveries for ten years. At the inception of either type of agreement, the acquiring institution records an indemnification asset to reflect the expected FDIC loss reimbursement under the life of the SLA.

Shared-loss agreements are designed to keep assets in the private sector, place failed bank assets with local acquirers, and preserve asset values while reducing resolution costs. Banks should not allow shared-loss considerations to unduly impact foreclosure decisions. Banks should only foreclose on properties after exhausting other loss-mitigation and workout options. To avoid unnecessary home foreclosures, most residential SLAs specifically require institutions to engage in loss-mitigation efforts in accordance with the FDIC's Mortgage Loan Modification Program or the national Home Affordable Modification Program.

Examination Considerations

Regional and field office personnel should regularly communicate with the Division of Resolutions and Receiverships (DRR) to coordinate activities and share SLA information. Pre-examination communication between examiners and DRR allows examiners to determine the type and extent of SLAs and the existence of any issues that might affect an institution's safety and soundness. If any of a bank's assets are covered by an SLA, examiners should review the agreement and consider its implications when:

- Performing asset reviews,
- Assessing accounting entries,
- Assigning asset classifications, and
- Determining CAMELS ratings.

Risk management examiners should include a sample of SLA-related commercial assets in their loan scope. The number of loans sampled should be sufficient to allow examiners to assess whether the assets are administered in a manner consistent with commercial assets not covered by SLAs. Examiners may determine it is unnecessary to include SLA-related residential mortgages in their loan scope; however, SLA coverage should be considered when assigning adverse classifications to residential credits covered by SLAs.

In most cases, the portion of an asset covered by an SLA should not be subject to adverse classification because loss sharing represents a conditional guarantee from the FDIC. Generally, the amount that would otherwise be adversely classified (Substandard, Doubtful, or Loss) should be reduced by the applicable coverage rate (often 80 or 95 percent).

Risk management examiners should review management's plans and efforts to ensure that the indemnification asset has a zero balance when the period for loss protection under an SLA expires. Examiners should discuss any potential SLA concerns with a regional SLA subject matter expert.

Risk management examiners are not expected to evaluate an institution's compliance with SLAs. Personnel from DRR evaluate compliance with SLAs; assess SLA-related accounting, reporting, and recordkeeping systems; and review loss-claim certificates. However, risk management examiners should notify their regional SLA subject matter expert and DRR staff if they identify potential problems or nonconformance with an agreement.

Other Examination Considerations

As noted above, if any of a bank's assets are covered by an SLA, examiners should review the agreement and consider its implications during examinations or visitations. The following scheduling considerations apply to FDIC-supervised institutions that received FDIC assistance, or were involved in purchase and assumption or deposit transfer transactions. Acquiring institutions with total assets in excess of ten times the deposits acquired, which are rated composite 2 or better are exempt from the following requirements.

A visitation or limited-scope examination should be conducted at state nonmember institutions within 30 days of the transaction date to determine how funds from the FDIC are being used and whether the bank is in compliance with any applicable assistance agreement. A second visitation or limited-scope examination should be conducted within six months of the transaction. A full-scope examination should be conducted within twelve months of the transaction. Thereafter, standard examination frequency schedules apply.

A cooperative program should be established with the appropriate federal agency for national, state member, and thrift institutions to ensure that all institutions receiving FDIC funds are properly monitored and that the FDIC regional director is informed of important developments.

MEETINGS WITH BANK PERSONNEL

Open dialogue with institution management is critical to forward-looking, risk-focused supervision. Open communication helps ensure examination requests are met and disruptions to an institution's daily activities are minimized. The EIC should extend an invitation (through senior management or directly to a board member if they meet a director during the examination) for directors to participate in regularly scheduled meetings with examiners or to schedule individual meetings with the EIC.

Director attendance at examination meetings increases their knowledge of the examination process and provides directors with an opportunity to discuss their views on bank-related matters with examiners. The meetings also allow examiners to gain insight into the experience levels and leadership qualities of bank management. While encouraging participation in examination meetings, the EIC should emphasize that director attendance is voluntary and that a lack of participation will not be viewed negatively.

Examiners should promote open communication at board meetings and encourage director participation in future examination meetings. Other ways to inform bankers and promote open communication includes references in the ROE transmittal letter and discussions during interim contacts and outreach events, such as Directors' Colleges.

Meetings with Management

Prior to the onsite examination, the EIC should communicate with management to coordinate examination activities. Such communication should address information requests (including the names of contact individuals), workspace plans, and the general scope of the examination. Other informal meetings should be held as needed throughout the examination to discuss various topics, gain management's perspective on local economic conditions and bank-specific issues, and to keep management informed regarding the progress of the examination. Prior to the conclusion of the examination, examiners should thoroughly discuss their findings and recommendations with senior management. Such meetings are critical in communicating examination findings to the bank and providing management an opportunity to respond. Exit meetings should fully apprise bank management of all deficiencies and supervisory recommendations that will be cited in the ROE.

The following examples represent situations that will prompt meetings and encourage dialogue between examiners and management during the course of an examination. The circumstances of each examination will determine the type and number of meetings necessary, as well as the degree of formality required to schedule and conduct the meetings.

Examination Planning The EIC should contact institution management approximately six to eight weeks ahead of the examination. The purpose of this contact is to discuss the preliminary description of the institution's business model, risk profile, and complexity, and to describe how those definitions are being used to determine the planned examination scope and request list content. The meeting provides an opportunity to get management's perspective on economic conditions, key challenges/risks, significant audit findings since the prior examination, and key risk-management processes. Primary topics of conversation should generally include current financial conditions; significant changes (planned or completed) to bank policies, personnel, or strategic direction; and any other significant changes since the previous examination.
The EIC should also discuss how and when information requests will be sent to the bank (electronic or hard copies), and the method and timing for any requested information to be delivered to examiners (FDIC*connect*, external media, or hard copies). Importantly, the EIC should facilitate the secure exchange of information between institution management and examiners, by ensuring that the delivery method(s) used meet the security measures discussed in the FDIC's e-Exam policies for the exchange, use, and storage of electronic information.

Finally, the EIC should conduct an onsite meeting with bank management, or conduct a telephone conversation with management if an onsite meeting is not feasible, in advance of the examination after reviewing the requested materials provided by management. The discussion should focus on examination logistics, including the size of the examination team; and plans for work to be completed off-site and on-site.

First Day Generally, the EIC and examination team should meet with senior management and staff during the first day of the examination for introductions, to request additional information, to discuss the areas that will be reviewed during the examination, and to cover other general examination requirements. Such meetings provide an opportunity to establish open lines of communication.

Follow-up on Prior Examination Issues Early in the examination, it is useful for the EIC to meet with senior management and discuss the bank's progress in responding to prior supervisory recommendations, as well as outstanding internal and external audit recommendations. This is also a good opportunity for examiners to gain management's perspectives on other bank-specific concerns.

Strategic Planning and Budget The EIC and management should discuss asset and/or capital growth plans, new business or business products, and other strategic and budget issues during the course of the examination.

Loan Discussion Management should participate in loan discussions and the initial review of adverse classifications, as appropriate, considering the size and condition of the institution and loan portfolio.

Material Preliminary Findings Normally, the EIC should notify senior management of major findings and possible recommendations before the final management meeting. This is to ensure that management has the opportunity to provide any additional information or clarification for examiner consideration before the conclusion of the examination.

Management Meetings The EIC is expected to communicate with institution management regularly during the examination to inform management of the examination progress and findings. Further, all major examination issues should be discussed with senior management as soon as practical during an examination. Additionally, all significant issues should be discussed again at the end of the examination, prior to meeting with the board of directors.

As noted in the Examination Letters for Troubled Institutions section above, the FDIC's expectations for troubled institutions should be clearly communicated to bank management between the close of an examination and the issuance of an enforcement action.

Regardless of the number or type of meetings held, it is critical that examiners ensure on-going two-way communication with management. Such communication enhances the effectiveness of the examination process by allowing all parties to freely exchange information.

Meetings with Directors

The policies in this section have been established for meetings with boards of directors. These policies are designed to encourage director involvement in, and enhance director awareness of, FDIC supervisory efforts and to increase the effectiveness of such efforts. The bank's composite rating is the most important variable in deciding if and when these meetings should be held.

Banks Assigned a Composite Rating of 4 or 5

The EIC and the regional director or designee should meet with the board of directors (with the required quorum in attendance) during or subsequent to the examination. Additional meetings or contacts with the board of directors or appropriate board committee may be scheduled at the regional director's discretion.

Banks Assigned a Composite Rating of 3

The EIC should meet with the board (with the required quorum in attendance) during or subsequent to the examination. Regional office representation is at the discretion of the regional director. Additional meetings or other contacts with the board of directors or appropriate board committee may be scheduled at the discretion of the regional director or designee.

Banks Assigned a Composite Rating of 1 or 2

The EIC will meet with the board or a board committee during or subsequent to the examination when 36 months or more have elapsed since the last such meeting; the management component of the CAMELS rating is 3, 4 or 5; any other CAMELS performance rating is 4 or 5; or any two performance ratings are 3, 4 or 5. It is important to note that meeting with a board committee (in lieu of the entire board) in conjunction with an examination is permissible only when the committee is influential as to policy, meets regularly, contains reasonable outside director representation, and reports regularly to the entire board. Other factors that may be relevant to the decision of holding a board meeting include recent changes in control, ownership, or top management; adverse economic conditions; requests by management or the board for a meeting; or any unique conditions or trends pertinent to the institution. Regional office participation in meetings with banks rated composite 1 or 2 is at the regional director's discretion.

Matters Requiring Board Attention (MRBA)

The EIC will meet with the board of directors, or a board committee, during or subsequent to the examination whenever the EIC recommends including a MRBA in the ROE. To assist directors in prioritizing their efforts to address MRBA, discussions should cover the reasons for the MRBA, highlight the benefits and importance of addressing issues and the possible consequences of not taking action.

Other Considerations

When a meeting is held in conjunction with an examination, reference should be made on the Examination Conclusions and Comments (ECC) schedule as to the committee or board members, bank managers or personnel, and regulators in attendance. A clear but concise presentation of the items covered at the meeting, including corrective commitments and/or reactions of management, should also be included. If a meeting is held, but not in conjunction with an examination, a summary of the meeting, including the items noted above, should be prepared and a copy mailed to the institution, via certified mail, for consideration by the board and inclusion in the official minutes of the directorate's next meeting.

When it is concluded that a meeting with a board committee rather than the full board is appropriate, selection of the committee must be based on the group's actual responsibilities and functions rather than its title. In all cases, the committee chosen should include an acceptable representation of board members who are not full-time officers.

The success of a board meeting is highly dependent upon the examiner's preparation. The EIC should notify bank management as soon as possible of any plans to meet with the board to present overall examination findings. A written agenda that lists all areas to be discussed and provides supporting documents or schedules generally enhances examiners' explanations of findings and recommendations. Failure to adequately prepare for a meeting can substantially diminish the supervisory value of an examination. Both the written agenda, and the EIC discussions at the meeting, should be clear regarding items that senior management and the board are expected to address.

To encourage awareness and participation, examiners should inform bank management that the examination report (or copies thereof) should be made available to each director for thorough and timely review, and that a signature page is included in the examination report to be signed by each director after review of the report. Management should also be reminded that the report is confidential, remains the property of the FDIC, and that utmost care should be exercised in its reproduction and distribution. The bank should be advised to retrieve, destroy, and record the fact of destruction of any reproduced copies after they have served their purpose.

OTHER SOURCES OF INFORMATION

The primary purpose of this Manual is to provide instructions to the field examiner that should be applied in the risk management examination process. Other policy manuals or other instructional materials pertaining to additional areas of examination interest, such as trust department operations, IT activities, transfer agent, and consumer compliance have also been developed. Those areas were not addressed significantly in this Manual in order to enhance the organization of the primary risk management material and to keep the document reasonable in length. However, exclusion of these topics in no way implies that these activities do not impact a safety and soundness examination. To the contrary, deficiencies in other aspects of a bank's operations can have a major impact on an institution's overall condition. Therefore, it is critical for examiners to be aware of the existence and understand the significance of deficiencies in other areas.

Specialty examination findings should be addressed in the ECC section of the risk management ROE. The placement and length of related comments should be commensurate with the significance of the findings and the impact on the UFIRS ratings. Inclusion of specific specialty examination pages in the ROE in support of findings in the ECC section is addressed in Manual Section 16.1 – Report of Examination Instructions.

If a specialty examination is conducted at a date substantially removed from other examination activities, examiners may communicate their findings through a visitation report and letter to the institution if warranted. However, summary comments should also be included in the risk management ROE and factored into the UFIRS ratings.

In some situations, it may be necessary for examiners to conduct specialty examinations separately from the Risk Management examination. In these rare cases, a separate specialty examination report may be prepared, consistent with regional guidance and outstanding report preparation instructions.

To emphasize and illustrate how weaknesses in these ancillary activities can adversely affect the whole bank, a brief overview of trust, IT, BSA, and consumer protection activities is provided.

Trust Department

A bank's trust department acts in a fiduciary capacity when the assets it manages are not the bank's, but belong to and are for the benefit of others. This type of relationship necessitates a great deal of confidence on the part of customers and demands a high degree of good faith and responsibility on a bank's part. The primary objective of a trust department examination is to determine whether its operations or the administration of its accounts have given rise to possible or contingent liabilities, or direct liabilities (estimated losses), which could reduce the bank's capital accounts. If the terms of trust instruments are violated, if relevant laws and regulations are not complied with, or if generally accepted fiduciary standards are not adhered to, the department, and hence the bank, may become liable and suffer losses. If the magnitude of these losses is very high, the viability of the bank may be threatened. To aid examiners in evaluating a trust department, the Uniform Interagency Trust Rating System was devised. Composite ratings of 1 (best performance) through 5 (worst performance) are assigned based on analysis of five critical areas of a trust department's administration and operations. These include Management; Operations, Internal Controls and Audits; Earnings; Compliance; and Asset Management.

Information Technology

Information technology services apply to virtually all recordkeeping and operational areas in banks. These IT services may be managed internally on a bank's own in-house computer system, or outsourced, wholly or in part, to an independent data center that performs IT functions. Although some or all IT services may be outsourced, management and the board retain oversight responsibilities.

The potential consequences of receiving faulty data or suffering an interruption of services are serious and warrant comprehensive IT policies and procedures and thorough IT examinations. A primary objective of an IT examination is to determine the confidentiality, integrity, and availability of records produced by automated systems. Examination priorities include an evaluation of management's ability to identify risks and maintain appropriate compensating controls.

IT operations are rated in accordance with the Uniform Rating System for Information Technology (URSIT), which is based on an evaluation of four critical components: audit; management; development and acquisition; and support and delivery. The composite IT rating is influenced by the performance of the four component functions and reflects the effectiveness of a bank's IT risk management and information security programs and practices. A scale of 1 through 5 is used, wherein 1 indicates strong performance and 5 denotes critically deficient operating performance.

Most IT examinations should be embedded in risk management ROEs. The URSIT composite and component ratings should be assigned at each IT examination and included in the ROE in accordance with Section 16.1 of the RMS Manual.

Bank Secrecy Act

The Financial Recordkeeping and Reporting of Currency and Foreign Transactions Act of 1970 is often referred to as the Bank Secrecy Act. The purpose of the BSA is to ensure U.S. financial institutions maintain appropriate records and file certain reports involving currency transactions and customer relationships. Several acts and regulations that strengthen the scope and enforcement of BSA, anti-money laundering (AML), and counter-terrorist-financing measures have been signed into law. Some of these include:

- Money Laundering Control Act-1986
- Annuzio-Wylie Anti-Money Laundering Act-1992
- Money Laundering Suppression Act-1994
- Money Laundering & Financial Crimes Strategy Act-1998
- USA PATRIOT Act-2001

Findings from BSA examinations are generally included within the risk management report; however, separate BSA examinations can be conducted. Although a separate rating system for BSA does not exist, BSA findings can affect both the management rating and the overall composite rating of the institution. Refer to the BSA section of this Manual for additional information.

Consumer Protection

The principal objective of consumer protection examinations is to determine a bank's compliance with various consumer and civil rights laws and regulations. Consumer protection statutes include, but are not limited to, Truth in Lending, Truth in Savings, Community Reinvestment Act, and Fair Housing regulations. Noncompliance with these regulatory restrictions and standards may result in an injustice to affected individual(s) and reflects adversely on an institution's management and reputation. Moreover, violations of consumer laws can result in civil or criminal liabilities, and consequently, financial penalties. If significant in amount, such losses could have an adverse financial impact on a bank. As is the case for IT and trust operations, an interagency rating system for consumer compliance has been designed. It provides a general framework for evaluating an institution's conformance with consumer protection and civil rights laws and regulations. A numbering scale of 1 through 5 is used with 1 signifying the strongest performance and 5 the worst performance. A separate examination rating is assigned to each institution based on its performance in the area of community reinvestment. The four ratings are outstanding, satisfactory, needs to improve, and substantial noncompliance.

Summary

Risk management examiners must have a general knowledge of the key principles, policies, and practices relating to IT, BSA, consumer protection, trust, and other specialty examinations. Additionally, examiners should be knowledgeable of state laws and regulations that apply to the banks they examine; the rules, regulations, statements of policy and various banking-related statutes contained in the FDIC Rules and Regulations; and the instructions for completing Consolidated Reports of Condition and Income.

DISCLOSING REPORTS OF EXAMINATION

The ROE is highly confidential. Although a copy is provided to a bank, that copy remains the property of the FDIC. Without the FDIC's prior authorization, directors, officers, employees, and agents of a bank are not permitted to disclose the contents of a report. Under specified circumstances, FDIC regulations permit disclosures by a bank to its parent holding company or majority shareholder.

Standard FDIC regulations do not prohibit employees or agents of a bank from reviewing the ROE if it is necessary for purposes of their employment. Accountants and attorneys acting in their capacities as bank employees or agents may review an examination report without prior FDIC approval, but only insofar as it relates to their scope of employment. The FDIC believes the definition of agent includes an accountant or accounting firm that performs an audit of the bank.

Reports of Examination are routinely provided to a bank's chartering authority. Therefore, state bank examiners may review the bank's copy of an FDIC examination during a state examination.

EXAMINATION WORKPAPERS

Introduction

Examiners should document their findings through a combination of brief summaries, source documents, report comments, and other workpapers that clearly describe financial conditions, management practices, and examination conclusions. Documentation should generally describe:

- Key audit/risk-scoping decisions,
- Source documents reviewed, and
- General examination procedures performed.

Documentation should include summary statements. Summary statements can take many forms, including notations on copies of source documents, separate hand-written notes, and electronic or hard-copy memorandums. At a minimum, summary comments should:

- Detail examination findings and recommendations,
- Describe supporting facts and logic, and
- Record management responses and completion dates for promised corrective actions.

Although examination documentation may be maintained in various ways, examiners must securely retain appropriate supporting records of all major examination conclusions, recommendations, and assertions detailed in the ROE.

Safeguarding Examination Information

Examination information may contain non-public customer information as defined in Section 501(b) of the Gramm-Leach-Bliley Act. Therefore, examiners must carefully safeguard information and follow established procedures for accessing, transporting, storing, and disposing of electronic and paper information. The procedures, which may involve Washington-, regional-, and field-office practices, should include technical, physical, and administrative safeguards and an incident response program.

Examiners must protect FDIC property and data and respond quickly to any security breech. Examiners should:

- Protect computer equipment and data in transit,
- Track data in transit, and
- Secure unattended equipment and data.

Examiners must report unauthorized access to data and equipment on a timely basis. Examiners should contact the FDIC's Help Desk within one hour after discovery; their supervisor as soon as possible; and in instances where theft of equipment is involved, the local police.

Examination Documentation (ED) Modules

Examination procedures have been developed jointly by the FDIC, the Federal Reserve, and various state agencies to provide examiners with tools to scope examination activities, evaluate financial conditions and risk-management practices, and document examination findings. The use of these modules is discretionary. When not used, examination findings should be documented as discussed above.

The ED modules incorporate questions and points of consideration into examination procedures that specifically address a bank's risk management strategies for each of its major business activities. The modules direct examiners to evaluate areas of risk and associated risk-control practices, thereby facilitating an effective supervisory program. The ED module examination procedures are generally separated into three distinct tiers: Core Analysis, Expanded Analysis, and Impact Analysis. The extent to which an examiner works through each of these levels of analysis depends upon the conclusions reached regarding the presence of significant concerns or deficiencies.

Where significant deficiencies or weaknesses are noted in the Core Analysis review, the examiner should complete the Expanded Analysis section, but only for the decision factors that present the greatest degree of risk to the bank.

On the other hand, if risks are properly managed, examiners can conclude their review after documenting conclusions concerning the Core Analysis Decision Factors and carrying forward any applicable comments to the ROE. The Expanded Analysis section provides guidance to examiners to help determine if weaknesses are material to a bank's condition or if an activity is inadequately managed.

The use of the modules should be tailored to the characteristics of each bank based on its size, complexity, and risk profile. As a result, the extent to which each module is completed will vary. Individual procedures presented for each level are meant only to serve as a guide for answering the decision factors. Each procedure does not require an individual response.

Substance of Workpapers

Appropriate documentation should be prepared and retained in the workpapers for each significant job task performed. A checklist of examination procedures performed may be used to document completed tasks and included as part of the examination workpapers. The checklist may also be used as the final documentation of lower-risk areas if findings are not material.

Examiners should use standardized loan line sheets except in special situations where alternative forms, such as institution-generated line sheets, provide a clear and substantial time savings and the same general loan information. Line sheets must contain sufficient, albeit sometimes brief, supporting data to substantiate a pass designation or adverse classification.

For BSA examinations, examiners should document preliminary, core, and expanded procedures as needed, in accordance with current guidance relating to BSA/AML workprograms for examination procedures.

Workpaper forms are available in ETS to supplement report pages for certain areas of review, such as risk-weighted assets and cash flow projections. When warranted, supplemental workpapers may be included in the ROE to the extent that they provide material support for significant findings.

Filing of Workpapers

Historically examiners maintained paper copies of documents to support examination findings. Generally, information can now be obtained electronically, or be captured electronically, using portable scanners. Examiners should scan documents that support examination findings unless technical or other issues require hard copies. Examiners should scan documents in a secure location within a reasonable time after receiving or developing them. Scanners should be turned off when not in use to clear the scanner's memory of previously scanned information. Examiners should return hardcopy documents to their source or destroy them in a secure manner (onsite when possible) after completing the scanning process.

Electronic documentation must be appropriately secured throughout the supervisory process to prevent disclosure of confidential or sensitive information to unauthorized individuals. Examiners should manage and store general examination documents using the Electronic Workpapers Module in the Regional Automated Document Distribution and Imaging System (RADD).

Examiners must exercise sound judgment in determining which electronic workpapers to retain. Examiners should only retain final documents that support examination or other supervisory findings (not multiple versions of a document) and delete all other documents. The examiner-in-charge is responsible for ensuring that only appropriate electronic workpapers are retained and that the workpapers are retained in accordance with existing policies and procedures.

At the conclusion of an examination or visitation, examiners should generally delete a bank's electronic workpapers from their laptops. However, electronic workpapers can be retained for longer periods if the information is needed to support ongoing business needs. In such instances, examiners should delete the electronic workpapers as soon as practical.

Note: Non-FDIC issued laptops, desktops, or other electronic devices may not be used to store institution-provided information or examination workpapers.

If hardcopy documents are maintained, the documents should be appropriately stored and secured. Each folder, envelope, or binder should be labeled with the institution's name and location, the date of examination, and a list of documents that were prepared for each category. At its discretion, each region and field office may designate the major documentation categories and supplemental lists for their respective office(s). The EIC is responsible for ensuring outdated workpapers are appropriately purged and current workpapers are properly organized and filed.

If hardcopy documents are physically transported to another location, examiners must follow existing procedures to create logs of hardcopy documents that contain personally identifiable information.

BSA workpapers must be retained for five years and should be maintained separately from the workpapers of the risk management examination. The separate retention of BSA workpapers will expedite their submission to the Treasury Department in the event they are requested.

Retention of Workpapers

Line sheets should generally be retained for one examination cycle, after which they may be purged from the active loan deck. Risk Management and Trust Officer's Questionnaires should be retained for a minimum of ten years from the examination start date. Officer's Questionnaires should be retained indefinitely when irregularities are discovered or suspected, especially if the signed questionnaire may provide evidence of these irregularities. The examiner may submit a copy of the Officer's Questionnaire with the ROE if circumstances warrant, such as when the examiner suspects that an officer knowingly provided incorrect information on the document.

Retention of other workpapers beyond one examination should generally be confined to those banks with existing or pending administrative actions, special documents relating to past insider abuse, documents that are the subject of previous criminal referral letters, or other such sensitive documents. While the retention of workpapers beyond one examination cycle is generally discouraged, major schedules and other pertinent workpapers can be retained if deemed useful. Additionally, if a bank's composite rating is 3 or worse, most workpapers should be maintained until the bank returns to a satisfactory condition.

←

ADDENDUM TO SECTION 1.1

UFIRS RATINGS DEFINITIONS

Composite Ratings

Composite ratings are based on a careful evaluation of an institution's managerial, operational, financial, and compliance performance. The six key components used to assess an institution's financial condition and operations are capital adequacy, asset quality, management capability, earnings quantity and quality, liquidity adequacy, and sensitivity to market risk. The composite ratings are defined as follows:

Composite 1

Financial institutions in this group are sound in every respect and generally have components rated 1 or 2. Any weaknesses are minor and can be handled in a routine manner by the board of directors and management. These financial institutions are the most capable of withstanding the vagaries of business conditions and are resistant to outside influences such as economic instability in their trade area. These financial institutions are in substantial compliance with laws and regulations. As a result, these financial institutions exhibit the strongest performance and risk management practices relative to the institution's size, complexity, and risk profile, and give no cause for supervisory concern.

Composite 2

Financial institutions in this group are fundamentally sound. For a financial institution to receive this rating, generally no component rating should be more severe than 3. Only moderate weaknesses are present and are well within the board of directors' and management's capabilities and willingness to correct. These financial institutions are stable and are capable of withstanding business fluctuations. These financial institutions are in substantial compliance with laws and regulations. Overall risk management practices are satisfactory relative to the institution's size, complexity, and risk profile. There are no material supervisory concerns and, as a result, the supervisory response is informal and limited.

Composite 3

Financial institutions in this group exhibit some degree of supervisory concern in one or more of the component areas. These financial institutions exhibit a combination of weaknesses that may range from moderate to severe; however, the magnitude of the deficiencies generally will not cause a component to be rated more severely than 4. Management may lack the ability or willingness to effectively address weaknesses within appropriate time frames. Financial institutions in this group generally are less capable of withstanding business fluctuations and are more vulnerable to outside influences than those institutions rated a composite 1 or 2. Additionally, these financial institutions may be in significant noncompliance with laws and regulations. Risk management practices may be less than satisfactory relative to the institution's size, complexity, and risk profile. These financial institutions require more than normal supervision, which may include formal or informal enforcement actions. Failure appears unlikely, however, given the overall strength and financial capacity of these institutions.

Composite 4

Financial institutions in this group generally exhibit unsafe and unsound practices or conditions. There are serious financial or managerial deficiencies that result in unsatisfactory performance. The problems range from severe to critically deficient. The weaknesses and problems are not being satisfactorily addressed or resolved by the board of directors and management. Financial institutions in this group generally are not capable of withstanding business fluctuations. There may be significant noncompliance with laws and regulations. Risk management practices are generally unacceptable relative to the institution's size, complexity, and risk profile. Close supervisory attention is required, which means, in most cases, formal enforcement action is necessary to address the problems. Institutions in this group pose a risk to the deposit insurance fund. Failure is a distinct possibility if the problems and weaknesses are not satisfactorily addressed and resolved.

Composite 5

Financial institutions in this group exhibit extremely unsafe and unsound practices or conditions; exhibit a critically deficient performance; often contain inadequate risk management practices relative to the institution's size, complexity, and risk profile; and are of the greatest supervisory concern. The volume and severity of problems are beyond management's ability or willingness to control or correct. Immediate outside financial or other assistance is needed in order for the financial institution to be viable. Ongoing supervisory attention is necessary. Institutions in this group pose a significant risk to the deposit insurance fund and failure is highly probable.

Component Ratings

Each of the component rating descriptions are divided into an introductory paragraph, a list of principal evaluation factors, and a brief description of each numerical rating. Some of the evaluation factors are reiterated under one or more of the other components to reinforce the interrelationship between components. The evaluation factors for each component rating are in no particular order of importance.

Capital Adequacy

A financial institution is expected to maintain capital commensurate with the nature and extent of risks to the institution and the ability of management to identify, measure, monitor, and control these risks. The effect of credit, market, and other risks on the institution's financial condition should be considered when evaluating the adequacy of capital. The types and quantity of risk inherent in an institution's activities will determine the extent to which it may be necessary to maintain capital at levels above required regulatory minimums to properly reflect the potentially adverse consequences that these risks may have on the institution's capital.

The capital adequacy of an institution is rated based upon, but not limited to, an assessment of the following evaluation factors:

- The level and quality of capital and the overall financial condition of the institution;
- The ability of management to address emerging needs for additional capital;
- The nature, trend, and volume of problem assets, and the adequacy of the allowance for loan and lease losses and other valuation reserves;
- Balance sheet composition, including the nature and amount of intangible assets, market risk, concentration risk, and risks associated with nontraditional activities;
- Risk exposure represented by off-balance sheet activities;
- The quality and strength of earnings, and the reasonableness of dividends;
- Prospects and plans for growth, as well as past experience in managing growth; and
- Access to capital markets and other sources of capital including support provided by a parent holding company.

Ratings

A rating of 1 indicates a strong capital level relative to the institution's risk profile.

A rating of 2 indicates a satisfactory capital level relative to the financial institution's risk profile.

A rating of 3 indicates a less than satisfactory level of capital that does not fully support the institution's risk profile. The rating indicates a need for improvement, even if the institution's capital level exceeds minimum regulatory and statutory requirements.

A rating of 4 indicates a deficient level of capital. In light of the institution's risk profile, viability of the institution may be threatened. Assistance from shareholders or other external sources of financial support may be required.

A rating of 5 indicates a critically deficient level of capital such that the institution's viability is threatened. Immediate assistance from shareholders or other external sources of financial support is required.

Asset Quality

The asset quality rating reflects the quantity of existing and potential credit risk associated with the loan and investment portfolios, other real estate owned, and other assets, as well as off-balance sheet transactions. The ability of management to identify, measure, monitor, and control credit risk is also reflected here. The evaluation of asset quality should consider the adequacy of the allowance for loan and lease losses and weigh the exposure to counter-party, issuer, or borrower default under actual or implied contractual agreements. All other risks that may affect the value or marketability of an institution's assets, including, but not limited to, operating, market, reputation, strategic, or compliance risks, should also be considered.

The asset quality of a financial institution is rated based upon, but not limited to, an assessment of the following evaluation factors:

- The adequacy of underwriting standards, soundness of credit administration practices, and appropriateness of risk identification practices;
- The level, distribution, severity, and trend of problem, classified, nonaccrual, restructured, delinquent, and nonperforming assets for both on- and off-balance sheet transactions;
- The adequacy of the allowance for loan and lease losses and other asset valuation reserves;

- The credit risk arising from or reduced by off-balance sheet transactions, such as unfunded commitments, credit derivatives, commercial and standby letters of credit, and lines of credit;
- The diversification and quality of the loan and investment portfolios;
- The extent of securities underwriting activities and exposure to counter-parties in trading activities;
- The existence of asset concentrations;
- The adequacy of loan and investment policies, procedures, and practices;
- The ability of management to properly administer its assets, including the timely identification and collection of problem assets;
- The adequacy of internal controls and management information systems; and
- The volume and nature of credit-documentation exceptions.

Ratings

A rating of 1 indicates strong asset quality and credit administration practices. Identified weaknesses are minor in nature and risk exposure is modest in relation to capital protection and management's abilities. Asset quality in such institutions is of minimal supervisory concern.

A rating of 2 indicates satisfactory asset quality and credit administration practices. The level and severity of classifications and other weaknesses warrant a limited level of supervisory attention. Risk exposure is commensurate with capital protection and management's abilities.

A rating of 3 is assigned when asset quality or credit administration practices are less than satisfactory. Trends may be stable or indicate deterioration in asset quality or an increase in risk exposure. The level and severity of classified assets, other weaknesses, and risks require an elevated level of supervisory concern. There is generally a need to improve credit administration and risk management practices.

A rating of 4 is assigned to financial institutions with deficient asset quality or credit administration practices. The levels of risk and problem assets are significant, inadequately controlled, and subject the financial institution to potential losses that, if left unchecked, may threaten its viability.

A rating of 5 represents critically deficient asset quality or credit administration practices that present an imminent threat to the institution's viability.

Management

The capability of the board of directors and management, in their respective roles, to identify, measure, monitor, and control the risks of an institution's activities and to ensure a financial institution's safe, sound, and efficient operation in compliance with applicable laws and regulations is reflected in this rating. Generally, directors need not be actively involved in day-to-day operations; however, they must provide clear guidance regarding acceptable risk exposure levels and ensure that appropriate policies, procedures, and practices have been established. Senior management is responsible for developing and implementing policies, procedures, and practices that translate the board's goals, objectives, and risk limits into prudent operating standards.

Depending on the nature and scope of an institution's activities, management practices may need to address some or all of the following risks: credit, market, operating or transaction, reputation, strategic, compliance, legal, liquidity, and other risks. Sound management practices are demonstrated by active oversight by the board of directors and management; competent personnel; adequate policies, processes, and controls taking into consideration the size and sophistication of the institution; maintenance of an appropriate audit program and internal control environment; and effective risk monitoring and management information systems. This rating should reflect the board and management's ability as it applies to all aspects of banking operations as well as other financial service activities in which the institution is involved.

The capability and performance of management and the board of directors is rated based upon, but not limited to, an assessment of the following evaluation factors:

- The level and quality of oversight and support of all institution activities by the board of directors and management;
- The ability of the board of directors and management, in their respective roles, to plan for, and respond to, risks that may arise from changing business conditions or the initiation of new activities or products;
- The adequacy of, and conformance with, appropriate internal policies and controls addressing the operations and risks of significant activities;
- The accuracy, timeliness, and effectiveness of management information and risk monitoring systems appropriate for the institution's size, complexity, and risk profile;
- The adequacy of audits and internal controls to promote effective operations and reliable financial and regulatory reporting; safeguard assets; and ensure

compliance with laws, regulations, and internal policies;
- Compliance with laws and regulations;
- Responsiveness to recommendations from auditors and supervisory authorities;
- Management depth and succession;
- The extent that the board of directors and management is affected by, or susceptible to, dominant influence or concentration of authority;
- Reasonableness of compensation policies and avoidance of self-dealing;
- Demonstrated willingness to serve the legitimate banking needs of the community; and
- The overall performance of the institution and its risk profile.

Ratings

A rating of 1 indicates strong performance by management and the board of directors and strong risk management practices relative to the institution's size, complexity, and risk profile. All significant risks are consistently and effectively identified, measured, monitored, and controlled. Management and the board have demonstrated the ability to promptly and successfully address existing and potential problems and risks.

A rating of 2 indicates satisfactory management and board performance and risk management practices relative to the institution's size, complexity, and risk profile. Minor weaknesses may exist, but are not material to the safety and soundness of the institution and are being addressed. In general, significant risks and problems are effectively identified, measured, monitored, and controlled.

A rating of 3 indicates management and board performance that need improvement or risk management practices that are less than satisfactory given the nature of the institution's activities. The capabilities of management or the board of directors may be insufficient for the type, size, or condition of the institution. Problems and significant risks may be inadequately identified, measured, monitored, or controlled.

A rating of 4 indicates deficient management and board performance or risk management practices that are inadequate considering the nature of an institution's activities. The level of problems and risk exposure is excessive. Problems and significant risks are inadequately identified, measured, monitored, or controlled and require immediate action by the board and management to preserve the soundness of the institution. Replacing or strengthening management or the board may be necessary.

A rating of 5 indicates critically deficient management and board performance or risk management practices. Management and the board of directors have not demonstrated the ability to correct problems and implement appropriate risk management practices. Problems and significant risks are inadequately identified, measured, monitored, or controlled and now threaten the continued viability of the institution. Replacing or strengthening management or the board of directors is necessary.

Earnings

This rating reflects not only the quantity and trend of earnings, but also factors that may affect the sustainability or quality of earnings. The quantity as well as the quality of earnings can be affected by excessive or inadequately managed credit risk that may result in loan losses and require additions to the ALLL, or by high levels of market risk that may unduly expose an institution's earnings to volatility in interest rates. The quality of earnings may also be diminished by undue reliance on extraordinary gains, nonrecurring events, or favorable tax effects. Future earnings may be adversely affected by an inability to forecast or control funding and operating expenses, improperly executed or ill-advised business strategies, or poorly managed or uncontrolled exposure to other risks.

The rating of an institution's earnings is based upon, but not limited to, an assessment of the following evaluation factors:

- The level of earnings, including trends and stability;
- The ability to provide for adequate capital through retained earnings;
- The quality and sources of earnings;
- The level of expenses in relation to operations;
- The adequacy of the budgeting systems, forecasting processes, and management information systems in general;
- The adequacy of provisions to maintain the allowance for loan and lease losses and other valuation allowance accounts; and
- The earnings exposure to market risk such as interest rate, foreign exchange, and price risks.

Ratings

A rating of 1 indicates earnings that are strong. Earnings are more than sufficient to support operations and maintain adequate capital and allowance levels after consideration is given to asset quality, growth, and other factors affecting the quality, quantity, and trend of earnings.

A rating of 2 indicates earnings that are satisfactory. Earnings are sufficient to support operations and maintain adequate capital and allowance levels after consideration is given to asset quality, growth, and other factors affecting the quality, quantity, and trend of earnings. Earnings that are relatively static, or even experiencing a slight decline, may receive a 2 rating provided the institution's level of earnings is adequate in view of the assessment factors listed above.

A rating of 3 indicates earnings that need to be improved. Earnings may not fully support operations and provide for the accretion of capital and allowance levels in relation to the institution's overall condition, growth, and other factors affecting the quality, quantity, and trend of earnings.

A rating of 4 indicates earnings that are deficient. Earnings are insufficient to support operations and maintain appropriate capital and allowance levels. Institutions so rated may be characterized by erratic fluctuations in net income or net interest margin, the development of significant negative trends, nominal or unsustainable earnings, intermittent losses, or a substantive drop in earnings from the previous years.

A rating of 5 indicates earnings that are critically deficient. A financial institution with earnings rated 5 is experiencing losses that represent a distinct threat to its viability through the erosion of capital.

Liquidity

In evaluating the adequacy of a financial institution's liquidity position, consideration should be given to the current level and prospective sources of liquidity compared to funding needs, as well as to the adequacy of funds management practices relative to the institution's size, complexity, and risk profile. In general, funds management practices should ensure that an institution is able to maintain a level of liquidity sufficient to meet its financial obligations in a timely manner and to fulfill the legitimate banking needs of its community. Practices should reflect the ability of the institution to manage unplanned changes in funding sources, as well as react to changes in market conditions that affect the ability to quickly liquidate assets with minimal loss. In addition, funds management practices should ensure that liquidity is not maintained at a high cost, or through undue reliance on funding sources that may not be available in times of financial stress or adverse changes in market conditions.

Liquidity is rated based upon, but not limited to, an assessment of the following evaluation factors:

- The adequacy of liquidity sources compared to present and future needs and the ability of the institution to meet liquidity needs without adversely affecting its operations or condition;
- The availability of assets readily convertible to cash without undue loss;
- Access to money markets and other sources of funding;
- The level of diversification of funding sources, both on- and off-balance sheet;
- The degree of reliance on short-term, volatile sources of funds, including borrowings and brokered deposits, to fund longer-term assets;
- The trend and stability of deposits;
- The ability to securitize and sell certain pools of assets; and
- The capability of management to properly identify, measure, monitor, and control the institution's liquidity position, including the effectiveness of funds management strategies, liquidity policies, management information systems, and contingency funding plans.

Ratings

A rating of 1 indicates strong liquidity levels and well-developed funds management practices. The institution has reliable access to sufficient sources of funds on favorable terms to meet present and anticipated liquidity needs.

A rating of 2 indicates satisfactory liquidity levels and funds management practices. The institution has access to sufficient sources of funds on acceptable terms to meet present and anticipated liquidity needs. Modest weaknesses may be evident in funds management practices.

A rating of 3 indicates liquidity levels or funds management practices in need of improvement. Institutions rated 3 may lack ready access to funds on reasonable terms or may evidence significant weaknesses in funds management practices.

A rating of 4 indicates deficient liquidity levels or inadequate funds management practices. Institutions rated 4 may not have or be able to obtain a sufficient volume of funds on reasonable terms to meet liquidity needs.

A rating of 5 indicates liquidity levels or funds management practices so critically deficient that the continued viability of the institution is threatened. Institutions rated 5 require immediate external financial assistance to meet maturing obligations or other liquidity needs.

Sensitivity to Market Risk

The sensitivity to market risk component reflects the degree to which changes in interest rates, foreign exchange rates, commodity prices, or equity prices can adversely affect a financial institution's earnings or economic capital. When evaluating this component, consideration should be given to management's ability to identify, measure, monitor, and control market risk; the institution's size; the nature and complexity of its activities; and the adequacy of its capital and earnings in relation to its level of market risk exposure.

For many institutions, the primary source of market risk arises from nontrading positions and their sensitivity to changes in interest rates. In some larger institutions, foreign operations can be a significant source of market risk. For some institutions, trading activities are a major source of market risk.

Market risk is rated based upon, but not limited to, an assessment of the following evaluation factors:

- The sensitivity of the financial institution's earnings or the economic value of its capital to adverse changes in interest rates, foreign exchange rates, commodity prices, or equity prices;
- The ability of management to identify, measure, monitor, and control exposure to market risk given the institution's size, complexity, and risk profile;
- The nature and complexity of interest rate risk exposure arising from nontrading positions; and
- Where appropriate, the nature and complexity of market risk exposure arising from trading and foreign operations.

Ratings

A rating of 1 indicates that market risk sensitivity is well controlled and that there is minimal potential that the earnings performance or capital position will be adversely affected. Risk management practices are strong for the size, sophistication, and market risk accepted by the institution. The level of earnings and capital provide substantial support for the degree of market risk taken by the institution.

A rating of 2 indicates that market risk sensitivity is adequately controlled and that there is only moderate potential that the earnings performance or capital position will be adversely affected. Risk management practices are satisfactory for the size, sophistication, and market risk accepted by the institution. The level of earnings and capital provide adequate support for the degree of market risk taken by the institution.

A rating of 3 indicates that control of market risk sensitivity needs improvement or that there is significant potential that the earnings performance or capital position will be adversely affected. Risk management practices need to be improved given the size, sophistication, and level of market risk accepted by the institution. The level of earnings and capital may not adequately support the degree of market risk taken by the institution.

A rating of 4 indicates that control of market risk sensitivity is unacceptable or that there is high potential that the earnings performance or capital position will be adversely affected. Risk management practices are deficient for the size, sophistication, and level of market risk accepted by the institution. The level of earnings and capital provide inadequate support for the degree of market risk taken by the institution.

A rating of 5 indicates that control of market risk sensitivity is unacceptable or that the level of market risk taken by the institution is an imminent threat to its viability. Risk management practices are wholly inadequate for the size, sophistication, and level of market risk accepted by the institution.

INTRODUCTION

Purpose of Capital

Bank capital performs several very important functions. It absorbs losses, promotes public confidence, helps restrict excessive asset growth, and provides protection to depositors and the deposit insurance funds.

Absorbs Losses

Capital allows institutions to continue operating as going concerns during periods when operating losses or other adverse financial results are experienced.

Promotes Public Confidence

Capital provides a measure of assurance to the public that an institution will continue to provide financial services even when losses have been incurred, thereby helping to maintain confidence in the banking system and minimize liquidity concerns.

Restricts Excessive Asset Growth

Capital, along with minimum capital ratio standards, restrains unjustified asset expansion by requiring that asset growth be funded by a commensurate amount of additional capital.

Protects Depositors and the Deposit Insurance Fund

Placing owners at significant risk of loss, should the institution fail, helps to minimize the potential for moral hazard, and promotes safe and sound banking practices.

The FDIC, as the primary insuring agency, has a responsibility to protect depositors and the deposit insurance fund. Consequently, the FDIC focuses attention on the adequacy of capital during bank examinations and in supervisory programs. For example, examiners carefully review asset and liability accounts to determine adjusted equity levels, as compared to simply identifying book capital. Similarly, examiners identify higher-risk assets, such as adversely classified loans, and assets listed for special mention or as concentrations, because the assets may contribute to losses or weaken capital in the future. Additionally, examiners review bank policies and procedures, and management's qualifications and performance, to identify weaknesses that could hinder earnings or reduce capital. And finally, to assess the potential effect on capital, examiners review bank's earnings, capital-distribution plans, and contingent liabilities that may arise from banking relationships, trust activities, or litigation.

←

REGULATORY CAPITAL REQUIREMENTS

Regulatory capital requirements have evolved as innovations in financial instruments and investment activities introduced greater complexity to the banking industry. To ensure regulatory requirements keep pace with these changes, federal banking agencies revised the rules governing qualifying capital instruments and minimum capital levels. Capital rules in the U.S. generally follow a framework of rules adopted by the Basel Committee on Banking Supervision (BCBS), an international standard-setting body that deals with various aspects of bank supervision. The FDIC is a member of the BCBS and works with the Board of Governors of the Federal Reserve System (FRB) and the Office of the Comptroller of the Currency (OCC) to establish domestic capital regulations.

In 2013, the FDIC, FRB, and OCC issued regulations for insured depository institutions in the U.S. that align with Basel III capital standards (Basel III). The standards and regulations are designed to strengthen the quality and quantity of bank capital and promote a stronger financial industry that is more resilient to economic stress. Basel III capital standards emphasize common equity tier 1 capital as the predominant form of bank capital. Common equity tier 1 capital is widely recognized as the most loss-absorbing form of capital, as it is permanent and places shareholders' funds at risk of loss in the event of insolvency. Moreover, Basel III strengthens minimum capital ratio requirements and risk-weighting definitions, increases Prompt Corrective Action (PCA) thresholds, establishes a capital conservation buffer, and provides a mechanism to mandate counter-cyclical capital buffers.

Basel III standards apply to all insured depository institutions. For FDIC-supervised institutions, the capital rules are contained in Part 324 of the FDIC Rules and Regulations. Part 324 defines capital elements, establishes risk-weighting guidelines for determining capital requirements under the standardized and advanced approaches, and sets PCA standards that prescribe supervisory action for institutions that are not adequately capitalized. Part 324 also establishes requirements to maintain a capital conservation buffer that affects capital distributions and discretionary payments. The phase-in of Part 324 began on January 1, 2014 for advanced approach institutions[1] and January 1, 2015 for community banks and

[1] Generally, an advanced approaches institution is an institution that has consolidated total assets of $250 billion or more or has on-balance sheet foreign exposure of $10 billion or more. Refer to Section 324.100.

other non-advanced approaches institutions. Full implementation of the rules for all institutions begins on January 1, 2019.

This chapter provides an overview of the rule; however examiners should refer to Part 324 for specific rule text.

Other Regulatory Requirements

Examiners should be aware of other regulatory requirements that address capital requirements, such as:

Topic	Rule
Risk-Based Insurance Premiums	Part 327 of the FDIC Rules and Regulations
Brokered Deposits	Section 337.6 of the FDIC Rules and Regulations
Limits on Extensions of Credit to Insiders	Section 337.3 of the FDIC Rules and Regulations and FRB Regulation O
Activities and Investments Insured State Nonmember	Part 362 of the FDIC Rules and Regulations
Limitations on Interbank Liabilities	Part 206 of FRB Regulations
Limitations on Federal Reserve Discount Window Advances	Section 10B of the Federal Reserve Act
Grounds for Appointing of Conservator or Receiver	Section 11(c)(5) of the Federal Deposit Insurance Act (FDI Act)

←

COMPONENTS OF CAPITAL

Part 324 establishes three components of regulatory capital: common equity tier 1 capital, additional tier 1 capital, and tier 2 capital. Tier 1 capital is the sum of common equity tier 1 capital and additional tier 1 capital. Total capital is the sum of tier 1 and tier 2 capital. Common equity tier 1 capital, tier 1 capital, and total capital serve as the numerators for calculating regulatory capital ratios. An institution's risk-weighted assets, as defined by Part 324, serve as the denominator for these ratios. Average total assets with certain adjustments serve as the denominator for the tier 1 leverage capital ratio.

Common Equity Tier 1 Capital

Common equity tier 1 capital is the most loss-absorbing form of capital. It includes qualifying common stock and related surplus net of treasury stock; retained earnings; certain accumulated other comprehensive income (AOCI) elements if the institution does not make an AOCI opt-out election (refer to opt-out election discussion in next paragraph), plus or minus regulatory deductions or adjustments as appropriate; and qualifying common equity tier 1 minority interests. It is important to note that the federal banking agencies expect the majority of common equity tier 1 capital to be in the form of common voting shares.

Part 324 allows all non-advanced approach institutions to make a permanent, one-time opt-out election, enabling them to calculate regulatory capital without AOCI. Such an election neutralizes the impact of unrealized gains or losses on available-for-sale bond portfolios in the context of regulatory capital levels. To opt-out, institutions must make a one-time permanent election on the March 31, 2015 Call Report. For institutions that do not or cannot opt-out, the AOCI adjustment to common equity tier 1 capital could have a significant impact on regulatory capital ratios if significant bond portfolio appreciation or depreciation occurs.

Part 324 requires that several items be fully deducted from common equity tier 1 capital such as goodwill, deferred tax assets that arise from net operating loss and tax credit carry-forwards, other intangible assets (except for mortgage servicing assets), gains on sale of securitization exposures, and certain investments in another financial institution's capital instruments. Additionally, banks must adjust for unrealized gains or losses on certain cash flow hedges. Finally, banks must consider threshold deductions for three specific types of assets: mortgage servicing assets, deferred tax assets related to temporary timing differences, and significant investments in another unconsolidated financial institution's common stock. Generally, banks must deduct the amount of exposure to these types of assets, by category, that exceeds 10 percent of a base common equity tier 1 capital calculation. In addition, there is a 15 percent aggregate limit on these three threshold deduction items. The amounts of threshold items not deducted will be assigned a 250 percent risk weight when Part 324 is fully phased in.

Additional Tier 1 Capital

Additional tier 1 capital includes qualifying noncumulative perpetual preferred stock, bank-issued Small Business Lending Fund and Troubled Asset Relief Program instruments that previously qualified for tier 1 capital, and qualifying tier 1 minority interests, less certain investments in other unconsolidated financial institutions' instruments that would otherwise qualify as additional tier 1 capital.

Tier 2 Capital

Tier 2 capital includes the allowance for loan and lease losses up to 1.25 percent of risk-weighted assets, qualifying preferred stock, subordinated debt, and qualifying tier 2 minority interests, less any deductions in the tier 2 instruments of an unconsolidated financial institution. Part 324 eliminates previous limits on term subordinated debt, limited-life preferred stock, and the amount of tier 2 capital includable in total capital.

Deductions and Limits

Investments in the capital instruments of another financial institution, such as common stock, preferred stock, subordinated debt, and trust preferred securities might need to be deducted from each tier of capital. Investments must be analyzed to determine whether they are significant or non-significant, which depends on the percentage of common stock that a bank owns in the other financial institution. If the bank owns 10 percent or less of the other institution's common shares, then all of that investment is non-significant. If a bank owns more than 10 percent, then all of the investment in that company is significant. Part 324 contains separate deduction requirements for significant and non-significant investments.

In many cases, deductions will be made from the tier of capital for which an investment would otherwise be eligible. To illustrate, if a bank's investment is an instrument that qualifies as tier 2 capital, it is deducted from tier 2 capital. If it qualifies as an additional tier 1 capital instrument, it is deducted from additional tier 1 capital. If it qualifies as a common equity tier 1 capital instrument, it is deducted from common equity tier 1 capital. If the bank does not have sufficient tier 2 capital to absorb a deduction, then the excess amount is deducted from additional tier 1 capital or from common equity tier 1 capital if there is insufficient additional tier 1 capital.

Part 324 limits the amount of minority interest in a subsidiary that may be included in each tier of capital. To be included in capital, the instrument that gives rise to minority interest must qualify for a particular tier of capital.

←

RISK-WEIGHTED ASSETS

Part 324 prescribes two approaches to risk weighting assets. The standardized approach is generally designed for community banks, while the advanced approach is used by larger, more complex institutions.

Standardized Approach

A bank's balance sheet assets and credit equivalent amounts of off-balance sheet items are generally assigned to one of four risk categories (0, 20, 50, and 100 percent) according to the obligor, or if relevant, the guarantor or the nature of the collateral. Part 324, Subpart D (Risk-weighted Assets-Standardized Approach) sets forth the criteria for categorizing non-advanced approach institutions' assets and off-balance sheet exposures for risk-weighting purposes.

Since the risk-weighting system was first introduced in the U.S. in the early 1990s, the general process of risk weighting assets has not changed. However, several changes implemented by the standardized approach involve risk weights other than the 0, 20, 50, and 100 percent categories. These changes are individually outlined below and include high volatility commercial real estate loans; past due asset exposures; securitizations or structured investments; equity exposures; and collateralized and guaranteed exposures.

High Volatility Commercial Real Estate Loans (HVCRE)

Loans designated as HVCRE loans generally refer to a subset of acquisition, development, and construction (ADC) loans that are assigned a risk-weighting of 150 percent. HVCRE loans do not include 1-4 family residential ADC projects, loans to finance agricultural properties, or community development projects. HVCRE loans also exclude ADC projects where:

- The loan-to-value is at or below supervisory maximums,
- The borrower contributed at least 15 percent of the as-completed value in cash or unencumbered marketable assets, and
- The contributed capital is contractually required to remain throughout the project life.

Past-Due Asset Risk Weights

The standardized approach requires financial institutions to transition assets that are 90 days or more past due or on nonaccrual from their original risk weight to 150 percent. For example, if the bank held a revenue bond that was on nonaccrual, Part 324 requires the bond to be risk weighted at 150 percent compared to its original 50 percent risk weight. This treatment could potentially apply to commercial, agricultural, multi-family, and consumer loans as well as fixed income securities. However, this requirement does not apply to past due 1-4 family residential real estate loans (which would be risk weighted at 100 percent), HVCRE (risk weighted at 150 percent), and the portion of loan balances with eligible guarantees or collateral where the risk weight can vary.

Structured Securities and Securitizations

Part 324 establishes risk weight approaches for securitization exposures and structured security exposures that are retained on- or off-balance sheet. Typical examples of securitization exposures include private label collateralized mortgage obligations (CMOs), trust preferred collateralized debt obligations, and asset-backed securities, provided there is tranching of credit risk. Generally, pass-through and government agency CMOs are excluded from the securitization exposure risk weight approaches. In general, Part 324 requires FDIC-supervised institutions to calculate the risk weight of securitization exposures using either the *gross-up approach* or the *Simplified Supervisory Formula Approach* (SSFA) consistently across all securitization exposures, except in certain cases. For instance, the bank can, at any time, risk-weight a securitization exposure at 1,250 percent.

The gross-up approach is similar to earlier risk-based capital rules, where capital is required on the credit exposure of the bank's investment in the subordinate tranche, as well as its pro rata share of the more senior tranches it supports. It calculates a capital requirement based on the weighted-average risk weights of the underlying exposures in the securitization pool.

The SSFA is designed to assign a lower risk weight to more senior-class securities and higher risk weights to support tranches. The SSFA is both risk-sensitive and forward-looking. The formula adjusts the risk weight for a security's underlying collateral based on key risk factors such as incurred losses, nonperforming loans, and the ability of subordinate tranches to absorb losses. In any case, a securitization is assigned at least a minimum risk weight of 20 percent.

Securitization Due Diligence

Section 324.41(c) implements due diligence requirements for securitization exposures. The analysis must be commensurate with the complexity of the securitization exposure and the materiality of the exposure in relation to capital.

Under these requirements, management must demonstrate a comprehensive understanding of the features of a securitization exposure that would materially affect its performance. The due diligence analysis should be conducted prior to acquisition and at least quarterly as long as the instrument is in the institution's portfolio.

When conducting analysis of a securitization exposure, the bank should consider structural features such as:

- Credit enhancements,
- Performance of servicing organizations,
- Deal-specific definitions of default, and
- Any other features that could materially impact the performance of the exposure.

The analysis should also assess relevant performance information of the underlying credit exposures such as:

- Past due payments;
- Prepayment rates;
- Property types;
- Average loan-to-value ratios;
- Geographic and industry diversification;
- Relevant market data information, such as bid-ask spreads;
- Recent sale prices;
- Trading volumes;
- Historic price volatility;
- Implied market volatility; and the
- Size, depth, and concentration level of the market for the securitization.

For re-securitization exposures, the analysis should assess the performance on underlying securitization exposures.

If management is not able to demonstrate sufficient understanding of a securitization exposure, regulators may require the bank to assign the exposure a 1,250 percent risk weight.

Equity Risk Weights

Part 324 assigns various risk weights for equity investments. Significant investments in the common shares of an unconsolidated financial institution that are not deducted from common equity tier 1 capital, are assigned a 250 percent risk weight when Basel III is fully phased in. For banks that are allowed to hold publicly traded equities, the risk weight for these assets ranges from 100 to 300 percent. A risk weight of 400 percent is assigned to non-publicly traded equity exposures. A risk weight of 600 percent is assigned to investments in a hedge fund or investment fund that has greater than immaterial leverage. To the extent that the aggregate adjusted carrying value of certain equity exposures does not exceed 10 percent of the bank's total capital, a 100 percent risk weight may be applied.

Part 324 also contains various look-through approaches for equity exposures to investment funds. For example, if a bank has an equity investment in a mutual fund that invests in various types of bonds, the regulation directs how to assign proportional risk weights based on the underlying investments. In addition, there is special treatment for a few classes of equity securities. Risk weights for Federal

Reserve Bank stock is 0 percent, Federal Home Loan Bank stock receives a 20 percent risk weight, and community development exposures, including Community Development Financial Institutions, are assigned 100 percent risk weights. Examiners should refer to Sections 324.51, 324.52, and 324.53 for additional information regarding risk weights for equity exposures.

Collateralized Transactions

In certain circumstances, an institution has the option to recognize the risk-mitigating effects of financial collateral to reduce the risk-based capital requirements associated with a collateralized transaction. Financial collateral includes cash on deposit (or held for the bank by a third party trustee), gold bullion, certain investment grade[2] securities, publicly traded equity securities, publicly traded convertible bonds, and certain money market fund shares.

Part 324 permits two general approaches to recognize financial collateral for risk weighting purposes. The simple approach generally allows substituting the risk weight of the financial collateral for the risk weight of any exposure. In order to use the simple approach, the collateral must be subject to a collateral agreement for at least the life of the exposure, the collateral must be revalued at least every 6 months, and the collateral (other than gold) and the exposure must be denominated in the same currency. The second approach, the collateral haircut (discount) approach, allows a bank to calculate the exposure for repo-style transactions, eligible margin loans, collateralized derivative contracts, and single-product netting sets of such transactions using a mathematical formula and supervisory haircut factors. Refer to Section 324.37 for additional details.

Most institutions are expected to use the simple approach; however, regardless of the approach chosen, it must be applied consistently for similar exposures or transactions.

The following are examples under the simple approach. A bank may assign a zero percent risk weight to the collateralized portion of an exposure where the financial collateral is cash on deposit. A bank may also assign a zero percent risk weight if the financial collateral is an exposure to a sovereign[3] that qualifies for a zero percent risk weight and the bank has discounted the market value of the collateral by 20 percent. Transactions collateralized by debt securities of government sponsored entities receive a 20 percent risk weight, while risk weights for transactions collateralized by money market funds will vary according to the funds' investments. Finally, for transactions collateralized by investment grade securities, such as general obligation municipal, revenue, and corporate bonds, banks may use collateral risk weights of 20, 50, and 100 percent, respectively.

Treatment of Guarantees

Under Part 324, banks have the option to substitute the risk weight of an eligible guarantee or guarantor for the risk weight of the underlying exposure. For example, if the bank has a loan guaranteed by an eligible guarantor, the bank can use the risk weight of the guarantor. Eligible guarantors include entities such as depository institutions and holding companies, the International Monetary Fund, Federal Home Loan Banks, the Federal Agricultural Mortgage Corporation, entities with investment grade debt, sovereign entities, and foreign banks. An eligible guarantee must be written, be either unconditional or a contingent obligation of the U.S. government or its agencies, cover all or a pro rata share of all contractual payments, give the beneficiary a direct claim against the protection provider, and meet other requirements outlined in the definition of eligible guarantees under Section 324.2.

Off-Balance Sheet Exposures

The risk-weighted amounts for all off-balance sheet items are determined by a two-step process. First, the "credit equivalent amount" is determined by multiplying the face value or notional amount of the off-balance sheet item by a credit conversion factor. Second, the credit equivalent amount is assigned to the appropriate risk category, like any other balance sheet asset.

Advanced Approaches

An institution that has consolidated total assets equal to $250 billion or more; that has consolidated total on-balance sheet foreign exposures equal to $10 billion or more; is a subsidiary of a depository institution or holding company that uses the advanced approaches; or elects to use the advanced approaches is generally subject to the advanced approaches which are described in Part 324, Subpart E (Risk-weighted Assets - Internal Ratings-Based and Advanced Measurement Approaches) and Subpart F (Risk-weighted Assets - Market Risk). These subparts outline requirements for risk weighting a complex institution's assets and other exposures, including trading accounts. The advanced approaches are not described in this Manual. Please refer to Part 324 and other pertinent materials for detailed information.

[2] *Investment grade* means that the issuer has adequate capacity to meet financial commitments for the projected life of the asset or exposure.

[3] *Sovereign* means a central government (including the U.S. government) or an agency, department, ministry, or central bank of a central government.

←

MINIMUM REGULATORY CAPITAL RATIOS

As defined by Section 324.10(a), FDIC-supervised institutions must maintain the following minimum capital ratios. These requirements are identical to those for national and state member banks.

- Common equity tier 1 capital to total risk-weighted assets ratio of 4.5 percent,
- Tier 1 capital to total risk-weighted assets ratio of 6 percent,
- Total capital to total risk-weighted assets ratio of 8 percent, and
- Tier 1 capital to average total assets ratio (tier 1 leverage ratio) of 4 percent.

Section 324.4(b) indicates that any insured institution which has less than its minimum leverage capital requirement may be deemed to be engaged in an unsafe and unsound practice pursuant to Section 8 of the FDI Act, unless the institution has entered into and is in compliance with a written agreement or has submitted and is in compliance with a plan approved by the FDIC to increase its leverage capital ratio and take other action as may be necessary. Section 324.4(c) indicates that any insured depository institution with a tier 1 capital to total assets ratio of less than 2 percent may be deemed to be operating in an unsafe and unsound condition.

Notwithstanding the minimum capital requirements, an FDIC-supervised institution must maintain capital commensurate with the level and nature of all risks to which the institution is exposed. Furthermore, an FDIC-supervised institution must have a process for assessing its overall capital adequacy in relation to its risk profile and a comprehensive strategy for maintaining an appropriate level of capital. The FDIC is not precluded from taking formal enforcement actions against an insured depository institution with capital above the minimum requirement if the specific circumstances indicate such action appropriate.

Additionally, FDIC-supervised institutions that fail to maintain capital at or above minimum leverage capital requirements may be issued a capital directive by the FDIC. Capital directives generally require an institution to restore its capital to the minimum leverage requirement within a specified time period. Refer to Section 15.1 – Formal Administrative Actions for further discussion on capital directives.

Supplementary Leverage Ratio

For advanced approach institutions, a supplementary leverage ratio of 3 percent will be required as of January 1, 2018. This supplemental ratio is not related to the four minimum capital ratios applicable to all insured institutions. The supplemental ratio is a stand-alone ratio that must be calculated by dividing tier 1 capital by total leverage exposure. Total leverage exposure consists of on-balance sheet items, less amounts deducted from tier 1 capital, plus:

- Potential future credit exposure related to derivatives contracts;
- Cash collateral for derivative transactions not meeting certain criteria;
- Effective notional amounts of sold credit derivatives;
- Gross value of receivables of repo-style transactions not meeting certain criteria;
- Ten percent of the notional amount of unconditionally cancellable commitments; and
- The notional amount of all other off-balance sheet exposures multiplied by standardized credit conversion factors, excluding securities lending and borrowing transactions, reverse repurchase agreements, and derivatives.

The supplemental leverage ratio is derived by calculating the arithmetic mean of this measure for the last day of each month in the reporting period.

In addition, the largest banking organizations will be subject to an enhanced supplementary leverage ratio beginning January 1, 2018. To avoid restrictions on capital distributions and discretionary bonus payments, bank holding companies (BHCs) with more than $700 billion in consolidated total assets or more than $10 trillion in assets under custody must maintain a leverage buffer greater than 2 percentage points above the minimum supplementary leverage ratio requirement of 3 percent, for a total of more than 5 percent. Insured depository institution subsidiaries of such BHCs must maintain at least a 6 percent supplementary leverage ratio to be considered well capitalized under the PCA framework.

Capital Conservation Buffer

The capital conservation buffer is designed to strengthen an institution's financial resilience during economic cycles. Beginning January 1, 2016, financial institutions will be required to maintain a capital conservation buffer as shown in the table below in order to avoid restrictions on capital distributions and other payments.

Year	CET1 Capital Conservation Buffer
2016	0.625%
2017	1.25%
2018	1.875%
2019	2.50%

If a bank's capital conservation buffer falls below the amount listed in the table above, its maximum payout amount for capital distributions and discretionary payments declines to a set percentage of eligible retained income based on the size of the bank's buffer. The following table reflects the maximum payout ratio for the fully phased in capital conservation buffer beginning January 1, 2019. For the maximum payout ratios during the transition period (January 1, 2016 through December 1, 2018), refer to Section 32.400(a)(2).

Capital Conservation Buffer (% of RWA)	Maximum Payout Ratio (% of Eligible Retained Income)
Greater than 2.5%	No payout limitation
Less than or equal to 2.5% and greater than 1.875%	60%
Less than or equal to 1.875% and greater than 1.25%	40%
Less than or equal to 1.25% and greater than 0.625%	20%
Less than or equal to 0.625%	0%

The types of payments subject to the restrictions include dividends, share buybacks, discretionary payments on tier 1 instruments, and discretionary bonus payments. It is important to note that the FDIC maintains the authority to impose further restrictions and require capital to be commensurate with the bank's risk profile.

A bank cannot make capital distributions or certain discretionary bonus payments during the current calendar quarter if its eligible retained income is negative and its capital conservation buffer was less than 2.50 percent as of the end of the previous quarter. Eligible retained income is a bank's net income as reported in its Call Reports for the four calendar quarters preceding the current quarter, net of any capital distributions, and certain discretionary bonus payments that were made during those four quarters.

To calculate the capital conservation buffer for a given quarter, each minimum risk-based capital requirement in Part 324 is subtracted from the institution's corresponding capital ratios. The following ratios would be subtracted from the institution's corresponding ratio to derive the buffer amount:

- Common equity tier 1 risk-based capital ratio minus 4.5 percent;
- Tier 1 risk-based capital ratio minus 6 percent; and
- Total risk-based capital ratio minus 8 percent.

The lowest of the three measures would represent the institution's capital conservation buffer and is used to determine its maximum payout for the current quarter. To the extent a bank's capital conservation buffer is 2.50 percent or less of risk-weighted assets, the bank's maximum payout amount for capital distributions and discretionary payments would decline.

The FDIC may permit an FDIC-supervised institution that is otherwise limited from making distributions and discretionary bonus payments to make a distribution or discretionary bonus payment upon an institution's request, if the FDIC determines that the distribution or discretionary bonus payment would not be contrary to the purposes of this section, or to the safety and soundness of the FDIC-supervised institution.

←

PROMPT CORRECTIVE ACTION

Part 324, Subpart H (Prompt Corrective Action) was issued by the FDIC pursuant to Section 38 of the FDI Act. Its purpose is to establish the capital measures and levels that are used to determine supervisory actions authorized under Section 38 of the FDI Act. Subpart H also outlines the procedures for the submission and review of capital restoration plans and other directives pursuant to Section 38. Notably, neither Subpart H nor Section 38 limits the FDIC's authority to take supervisory actions to address unsafe or unsound practices or conditions, deficient capital levels, or violations of law. Actions under this Subpart and Section 38 may be taken independently of, in conjunction with, or in addition to any other enforcement action available to the FDIC.

The following table summarizes the PCA categories.

PCA Category	Total RBC Ratio	Tier 1 RBC Ratio	CET1 RBC Ratio	Tier 1 Leverage Ratio
Well Capitalized	10%	8%	6.5%	5%
Adequately Capitalized	8%	6%	4.5%	4%
Undercapitalized	< 8%	< 6%	< 4.5%	< 4%
Significantly Undercapitalized	< 6%	< 4%	< 3%	< 3%
Critically Undercapitalized	Tangible Equity/Total Assets ≤ 2%			

Any bank that does not meet the minimum PCA requirements may be deemed to be in violation of Part 324, and engaged in an unsafe or unsound practice unless the bank has entered into and is in compliance with a written plan approved by the FDIC. In addition, under Subpart H, the FDIC may reclassify a well-capitalized FDIC-supervised institution as adequately capitalized, or require an adequately capitalized or undercapitalized FDIC-supervised institution to comply with certain mandatory or discretionary supervisory actions as if the institution were in the next lower PCA category. Refer to Part 324, Subpart H for further details.

EXAMINATION-IDENTIFIED DEDUCTIONS FROM COMMON EQUITY CAPITAL

Identified Losses and Inadequate Reserves

Part 324 provides that, on a case-by-case basis and in conjunction with supervisory examinations of an FDIC-supervised institution, deductions from capital may be required. The definition of common equity tier 1 capital specifically provides for the deduction of identified losses, such as items classified Loss, any provision expenses that are necessary to replenish the Allowance for Loan and Lease Losses (ALLL) to an adequate level, estimated losses in contingent liabilities, differences in accounts which represent shortages, and liabilities not shown on books. Losses attributed to a criminal violation may also need to be deducted from capital; refer to Section 16.1 – Report of Examination Instructions for the Capital Calculations page instructions. Also, for the calculation of capital ratios, assets may need to be adjusted for certain identified losses; refer to the instructions for the Capital Calculations page for details.

When it is deemed appropriate during an examination to adjust capital for items classified Loss or for an inadequate ALLL, the following method should be used by examiners. This method avoids adjustments that may otherwise result in a double deduction (e.g., for loans classified Loss), particularly when common equity tier 1 capital already has been effectively reduced through provision expenses recorded in the ALLL. Additionally, the following method addresses situations where an institution overstated the amount of common equity tier 1 capital by failing to take necessary provision expenses to establish and maintain an adequate ALLL.

- Deduct the amount of Loss for items other than held-for-investment loans and leases in the calculation of common equity tier 1 capital. If other real estate (ORE) general reserves exist, refer to the discussion of Other Real Estate Reserves below.
- Deduct the amount of Loss for held-for-investment loans and leases from the ALLL in the calculation of tier 2 capital.
- If the ALLL is considered inadequate, an estimate of the provision expense needed for an adequate ALLL should be made. The estimate is made after identified losses have been deducted from the ALLL. Loans and leases classified Doubtful should not be directly deducted from capital. Rather, they should be included in the evaluation of the ALLL and, if appropriate, accounted for by the inadequate ALLL adjustment. An adjustment from common equity tier 1 capital to tier 2 capital for the provision expenses necessary to replenish the ALLL to an adequate level should be made when the amount is significant.

Other Real Estate Reserves

Other real estate reserves, whether considered general or specific reserves, are not recognized as a component of regulatory capital. However, these reserves should be considered when accounting for ORE that is classified Loss. Examiners should consider the existence of any general ORE reserves when deducting ORE classified Loss. To the extent ORE reserves adequately cover the risks inherent in the ORE portfolio as a whole, including any individual ORE properties classified Loss, there would not be a deduction from common equity tier 1 capital. The ORE Loss in excess of ORE reserves should be deducted from common equity tier 1 capital under Assets Other Than Held-for-Investment Loans and Leases Classified Loss.

Liabilities Not Shown on Books

Non-book liabilities have a direct bearing on capital adjustments. These definite and direct, but unbooked liabilities (contingent liabilities are treated differently) should be carefully verified and supported by factual comments. Examiners should recommend that bank records be adjusted so that all liabilities are properly reflected. Deficiencies in a bank's accrual accounting system, which are of such magnitude that the institution's capital accounts are significantly overstated constitutes an example of non-book liabilities for which an adjustment should be made in the examination capital analysis. Similarly, an adjustment to capital should be made for material, deferred tax liabilities or for a significant amount of unpaid bills that are not reflected on the bank’s books.

←

CAPITAL ADEQUACY

The FDIC's authority to enforce capital standards in financial institutions includes the use of written agreements, capital directives, and discretionary actions. A discussion on the use of these powers is included in Section 15.1 - Formal Administrative Actions, of this manual. Specific recommendations regarding capital adequacy should not be made solely on the examiner's initiative. Coordination between the examiner and the regional office is essential in this area. If the level or trend of the bank's capital position is adverse, the matter should be discussed with management with a comment included in the examination report. It is particularly important that management's plans to correct the capital deficiency be accurately determined and noted in the report, along with the examiner's assessment of the feasibility and sufficiency of those plans.

Supervisory assessments of capital adequacy will generally be based on the following factors.

Less Than Adequately Capitalized Institutions

Banks that fail to meet minimum capital ratios are often subject to capital directives or other formal enforcement action by the FDIC to increase capital. Moreover, such institutions may have any application submitted to the FDIC denied if such application requires the FDIC to evaluate the adequacy of the institution's capital structure.

Fundamentally Sound and Well-Managed Banks

Minimum capital ratios are generally viewed as the minimum acceptable standards for banks whose overall financial condition is fundamentally sound, which are well-managed, and which have no material or significant financial weaknesses. While the FDIC will make this determination based on each bank's own condition and specific circumstances, the definition generally applies to those banks evidencing a level of risk, which is no greater than that normally associated with a Composite rating of 1 or 2. Banks meeting this definition, which are in compliance with the minimum capital requirements, will not generally be required by the FDIC to raise new capital from external sources.

Problem Banks

Banks evidencing a level of risk at least as great as that normally associated with a Composite rating of 3, 4, or 5 will be required to maintain capital higher than the minimum regulatory requirement and at a level deemed appropriate in relation to the degree of risk within the institution. These higher capital levels should normally be addressed through informal actions, such as Memoranda of Understanding, between the FDIC and the bank or, in cases of more pronounced risk, through the use of formal enforcement actions under Section 8 of the FDI Act.

Capital Requirements of Primary Regulator

All insured depository institutions are expected to meet any capital requirements established by their primary state or federal regulator that exceed the minimum capital requirement set forth by regulation. The FDIC will consult with the bank's primary state or federal regulator when establishing capital requirements higher than the minimum set forth by regulation.

Capital Plans

Banks with insufficient capital in relation to their risk profile are often required to submit a capital plan to the FDIC in conjunction with a formal enforcement action or other directive. The development of a capital plan is frequently recommended by the FDIC to help boards of directors formulate a plan for restoring capital adequacy. Capital plans may be requested informally through the supervisory process, a Memorandum of Understanding, or other mandatory or discretionary supervisory action. Examiners should consider the necessity of recommending a capital plan if the adequacy of the capital position is in question. If a capital plan is in place, examiners should assess compliance with the plan and whether the outstanding capital plan remains appropriate and, if necessary, recommend revisions to the regional office.

Disallowing the Use of Bankruptcy

Section 2522(c) of the Crime Control Act of 1990 amended the Bankruptcy Code to require that in Chapter 11 bankruptcy cases the trustee shall seek to immediately cure any deficit under any commitment by a debtor to maintain the capital of an insured depository institution. Chapter 11 cases are those in which a debtor company seeks to reorganize its debt. In addition, Section 2522(d) provides an eighth priority in distribution for such commitments. These provisions place the FDIC in a strong, preferred position with respect to a debtor if a commitment to maintain capital is present and the institution is inadequately capitalized.

This provision will only be useful to the FDIC if commitments to maintain capital can be obtained from owners of institutions such as holding companies, or other corporations or financial conglomerates. Examples of situations where opportunities might exist include situations where a prospective owner might be attempting to mitigate a factor such as potential future risk to the insurance funds or when the FDIC is providing assistance to an acquirer. In addition, in accordance with the PCA provisions in Part 324, undercapitalized FDIC-supervised institutions are required to file a capital plan with the FDIC and, before such a capital plan can be accepted, any company having control over the institution would need to guarantee the bank's compliance with the plan. However, in any case, a commitment to maintain capital should be considered only as an additional enhancement and not as a substitute for actual capital.

Increasing Capital in Operating Banks

To raise capital ratios, management of an institution must increase capital levels or reduce asset growth to the point that the capital formation rate exceeds asset growth. The following sections describe alternatives to increasing the capital level in banks.

Increased Earnings Retention

Management may attempt to increase earnings retention through a combination of higher earnings or lower cash dividend rates. Earnings may be improved, for example, by tighter controls over certain expense outlays; repricing of loans, fees, or service charges; upgrading credit standards and administration to reduce loan or investment losses, or through various other adjustments. An increase in retained earnings will improve capital ratios assuming the increase exceeds asset growth.

Sale of Additional Capital Stock

Sometimes increased earnings retention is insufficient to address capital requirements and the sale of new equity must be pursued. One adverse effect of this option is shareholder dilution. If the sale of additional stock is a consideration, examiners should indicate in the examination report the sources from which such funds might be obtained. This notation will be helpful as background data for preliminary discussions with the state banking supervisor and serves to inform the regional director as to the practical possibilities of new stock sales. The following information could be incorporated into the report, at the examiner's discretion:

- A complete list of present shareholders, indicating amounts of stock held and their financial worth. Small holdings may be aggregated if a complete listing is impractical.
- Information concerning individual directors relative to their capacity and willingness to purchase stock.
- A list of prominent customers and depositors who are not shareholders, but who might be interested in acquiring stock.
- A list of other individuals or possible sources of support in the community who, because of known wealth or other reasons, might desire to subscribe to new stock.

Any other data bearing upon the issue of raising new capital, along with the examiner's opinions regarding the most likely prospects for the sale of new equity, should be included in the confidential section of the examination report.

Reduce Asset Growth

Bank management may also increase capital ratios by reducing asset growth to a level below that of capital formation. Some institutions will respond to supervisory concerns regarding the bank's capitalization level by attempting to reduce the institution's total assets. Sometimes this intentional asset shrinkage will be accomplished by disposing of short-term, marketable assets and allowing volatile liabilities to run off. This reduction may result in a relatively higher capital-to-assets ratio, but it may leave the bank with a strained liquidity posture. Therefore, it is a strategy that can have adverse consequences from a safety and soundness perspective and examiners should be alert to the possible impact this strategy could have in banks that are experiencing capital adequacy problems.

Contingent Liabilities

Contingent liabilities reflect potential claims on bank assets. Any actual or direct liability that is contingent upon a future event or circumstance may be considered a contingent liability. Contingent liabilities are divided into two general categories. Category I contingent liabilities result in a concomitant increase in bank assets if the contingencies convert to actual liabilities. These contingencies usually result from off-balance sheet lending activities such as loan commitments and letters of credit. For example, when a bank funds an existing loan commitment or honors a draft drawn on a letter of credit, it generally originates a loan for the amount of liability incurred.

Category II contingent liabilities include those in which a claim on assets arises without an equivalent increase in assets. For example, pending litigation in which the bank is defendant or claims arising from trust operations could reduce an institution’s cash or other assets.

Examination Policies

Examination interest in contingent liabilities is predicated upon an evaluation of the impact contingencies may have on a bank's condition. Contingent liabilities that are significant in amount or have a high probability of becoming direct liabilities must be considered when the bank's component ratings are assigned. For example, the amount of contingent liabilities and the extent to which they may be funded must be considered in the analysis of liquidity. Determination of the management component may appropriately include consideration of contingencies, particularly off-balance sheet lending practices. Contingent liabilities arising from off-balance sheet fee producing activities may enhance earnings. In rating earnings, the impact of present and future fee income should be analyzed.

The extent to which contingent liabilities may ultimately result in charges against capital accounts is always part of the examination process and an important consideration in rating capital. Examiners should consider the degree of off-balance sheet risk in their analysis of the bank's overall capital adequacy and the determination of compliance with Part 324 of the FDIC Rules and Regulations.

Potential and Estimated Losses

As described above, Category I contingent liabilities are defined as those that will give rise to a concomitant increase in bank assets if the contingencies convert into actual liabilities. Such contingencies should be evaluated for credit risk and, if appropriate, listed for Special Mention or subjected to adverse classification. If a Category I contingent liability is classified Loss, it would be included in the *Other Adjustments to and Deductions from Common Equity Tier 1 Capital* category on the Capital Calculations page if an allowance has not been established for the classified exposure. To the extent the off-balance sheet credit exposure classified Loss has an associated allowance, the Loss is deducted from the allowance for credit losses on off-balance sheet credit exposures, not Common Equity Tier 1 Capital.

A bank's exposure to Category II contingent liabilities normally depends solely on the probability of the contingencies becoming direct liabilities. To reflect the degree of likelihood that a contingency may result in a charge to the capital accounts, the terms potential loss and estimated loss are used. A loss contingency is an existing condition, situation, or set of circumstances that involves uncertainty as to possible loss that will be resolved when one or more future events occur or fail to occur. Potential loss refers to contingent liabilities in which there is substantial and material risk of loss to the bank. An estimated loss from a loss contingency (for example, pending or threatened litigation) should be recognized if it is probable that an asset has been impaired or a liability incurred as of the examination date and the amount of the loss can be reasonably estimated.

For further information, examiners should refer to the Statement of Financial Accounting Standards Codification (ASC) 450 Contingencies.

The memorandum section of the Capital Calculations page of the Report of Examination includes two contingent liability items. The first item, Contingent Liabilities, refers to Category I contingent liabilities. The second item, Potential Loss, refers only to Category II contingent liabilities. Estimated losses related to Category II contingent liabilities are reflected in the Other Adjustments to and Deductions from Common Equity Tier 1 Capital line item. Contingent liability losses are not included as adjustments to assets.

Common Forms of Contingent Liabilities

Common types and characteristics of contingent liabilities encountered in bank examinations are discussed below. In all cases, the examiner's fundamental objectives are to ascertain the likelihood that such contingencies may result in losses to the bank and assess the pending impact on its financial condition.

Litigation

If the bank is involved in a lawsuit where the outcome may affect the bank’s financial condition, the examiner should include the facts in the examination report. Comments should address the essential points upon which the suit is based, the total dollar amount of the plaintiff's claim, the basis of the bank's defense, the status of any negotiations toward a compromise settlement, and the opinion of bank management or counsel relative to the probability of a successful defense. In addition, corroboration of information and opinions provided by bank management regarding significant lawsuits should be obtained from the bank's legal counsel. At the examiner's discretion, reference to suits that are small or otherwise of limited consequence may be omitted from the examination report.

Determination of potential or estimated losses in connection with lawsuits is often difficult. There may be occasions where damages sought are of such magnitude that, if the bank is unsuccessful in its defense, it could be rendered insolvent. In such instances, examiners should consult their regional office for guidance. All potential and estimated losses must be substantiated by comments detailing the specific reasons leading to the conclusion.

Trust Activities

Contingent liabilities may develop within the trust department due to actions or inactions of the bank acting in its fiduciary capacity. These contingencies may arise from failure to abide by governing instruments, court orders, generally accepted fiduciary standards, or controlling statutes and regulations. Deficiencies in administration by the trust department can lead to lawsuits, surcharges, or other penalties that must be absorbed by the bank's capital accounts. Therefore, the dollar volume and severity of such contingencies must be analyzed during the safety and soundness examination.

Consigned Items and Nonledger Control Accounts

Banks sometimes provide customer services that do not result in transactions entered on the general ledger. These customer services include safekeeping, rental of safe deposit box facilities, purchase and sale of investments for customers, sale of traveler's checks, and collection department services. It is management's responsibility to ensure that collateral and other nonledger items are properly recorded and protected by effective custodial controls. Proper insurance protection must be obtained to protect against claims arising from mishandling, negligence, or other unforeseen occurrences. Failure to take protective steps may lead to contingent liabilities. The following is a brief description of customer service activities involving consigned items.

Customer Safekeeping

Safe Deposit Boxes - The bank and its customers enter into a contract whereby the bank receives a fee for renting safe deposit boxes and assumes responsibility of exercising reasonable care against loss of the box's contents. When a loss does occur, unless the bank can demonstrate that it employed reasonably prudent care, it could be held liable. Safe deposit box access should be granted only after verifying the lessee's signature at each visit. The bank generally cannot gain access to a customer's safe deposit box except as allowed under certain statutes or court orders.

Safekeeping - In addition to items held as collateral for loans, banks occasionally hold customers' valuables. To limit potential liabilities, banks should attempt to discourage this practice by emphasizing the benefits of a safe deposit box, but when not possible or practical to do so, the same procedures employed in handling loan collateral must be followed.

Custodial Accounts - Banks may act as custodian for customers' investments such as stocks, bonds, or gold. When serving as custodian, the bank has only the duties of safekeeping the property involved and performing ministerial acts as directed by the principal. As a rule, no management or advisory duties are exercised. Before providing such services, the bank should seek advice of legal counsel concerning applicable state and federal laws governing this type of relationship. In addition, use of signed agreements or contracts, which clearly define the bank's duties and responsibilities is an important part in limiting potential liability.

Collection Items

The collection department may act as an agent for others in receiving, collecting, and liquidating items. In consideration for this service, a fee is generally received. An audit trail must be in place to substantiate proper handling of all items to reduce the bank's potential liability.

Consigned Items

Consigned items typically include traveler's checks. Banks share a fee with the consignor of traveler's checks. A working supply is generally maintained at the selling station(s) and the reserve supply should be maintained under dual control in the bank's vault.

Reserve Premium Accounts

The American Bankers Association (ABA) sponsored the creation of the American Bankers Professional and Fidelity Insurance Company Ltd. (ABPFIC). The ABPFIC is a mutual insurance company that reinsures a portion of Progressive Company's directors and officers liability and fidelity bond insurance programs, which are available to banks that are ABA members. Banks that obtain insurance coverage from Progressive become members of ABPFIC. As a mutual reinsurance company, ABPFIC established a mechanism (a Reserve Premium Account) by which its members are required to provide additional funds to ABPFIC to cover losses.

The Reserve Premium Account Agreement between the bank and the ABPFIC provides for the bank to deposit into the Account an amount equal to the insurance premiums quoted by Progressive for the bank's first year combined Director and Officer Liability insurance, Financial Institution Bond, and such other coverages written by Progressive. No funds are actually placed with or transferred to ABPFIC when a Reserve Premium Account is established. Rather, a bank can satisfy this deposit requirement by pledging or otherwise earmarking specific bank assets for this purpose.

Unless ABPFIC makes a demand for payment from Reserve Premium Accounts to cover losses, the assets in such accounts remain bank assets and any associated earnings are the banks'. Any demand for payment would reportedly be made on a pro rata basis to all banks that must maintain a Reserve Premium Account. Establishing a Reserve Premium Account results in a Category II contingent liability equal to the bank's deposit into the account.

Under ASC 450 a bank would accrue an estimated loss from the contingent liability resulting from having entered into a Reserve Premium Account Agreement with ABPFIC when and if available information indicates that (1) it is probable that ABPFIC will make a demand for payment from the account and (2) the amount of the payment can be reasonably estimated.

The asset used to satisfy the Reserve Premium Account requirement should be shown in the proper balance sheet category and considered a pledged asset. If a bank pledged or otherwise earmarked any short term and marketable assets (e.g., securities) for its Reserve Premium Account, the amount of the bank's contingent liability should be reflected in management's internal liquidity analysis since the assets used to satisfy Reserve requirement are not available to meet liquidity needs.

←

EVALUATING CAPITAL ADEQUACY

Banks are expected to meet any capital requirements properly established by its primary state or federal regulator, which exceed the minimum capital requirement set forth in the regulation. Once these minimum capital requirements are met, the evaluation of capital adequacy extends to factors that require a combination of analysis and judgment. Banks are too dissimilar to permit use of standards based on one or only a few criteria. Generally, a financial institution is expected to maintain capital commensurate with the nature and extent of risks to the institution and the ability of management to identify, measure, monitor, and control these risks.

It is important to note that what is adequate capital for safety and soundness purposes may differ significantly from the minimum leverage and risk-based standards and the *Well Capitalized* and *Adequately Capitalized* definitions that are used in the PCA regulations and certain other capital-based rules. The minimums set forth in the leverage and risk-based capital standards apply to sound, well-run institutions.

In all cases, a financial institution is expected to maintain capital commensurate with the risks to which it is exposed, especially the volume and severity of adversely classified assets.

After determining that an institution meets the minimum capital requirements, examiners should use judgment and financial analysis to assess the overall adequacy of an institution's capital. The capital adequacy of an institution is rated based upon, but not limited to, an assessment of the following factors.

Financial Condition of the Institution

The institution's overall financial condition and risk management practices are important considerations when assessing capital adequacy. For example, asset quality problems can cause losses that deplete capital, and poor earnings can hinder capital formation. Additionally, institutions with weak policies, procedures, or management teams may be unable to address financial risks. Furthermore, risk may not always be reflected in the current financial condition. Therefore, examiners should not rely solely on an institution's current financial condition when determining capital adequacy and must assess management's ability to identify, measure, monitor, and control all material risks that may affect capital.

Quality of Capital

The composition of and quality of capital are important considerations when assessing capital adequacy. Higher-quality capital that is available to absorb losses on a going-concern basis enhances the institution's resiliency. For instance, all things being equal, voting common equity is higher quality than hybrid capital instruments because voting common equity is available to absorb losses as they occur while hybrid capital instruments have debt-like features that may limit its ability to absorb losses.

Emerging Needs for Additional Capital

Management's ability to address emerging needs for additional capital depends on many factors. A few of these factors include earnings performance and growth plans, the financial capacity of the directorate, and the strength of a holding company. A combination of ratio analysis and examiner judgment is required to evaluate these types of issues. As part of assessing capital adequacy, the impact of growth and strategic objectives should be considered.

Problem Assets

The nature, trend, and volume of problem assets and the adequacy of the ALLL are vital factors in determining capital adequacy. Items to consider include:

- The type and level of problem assets,
- Loan-origination and portfolio-administration activities,
- The level of the ALLL, and
- The institution's methodology for establishing the ALLL level.

Examiners should consider current, and when applicable prior, examination findings when assessing capital adequacy. Examiners should also review Uniform Bank Performance Reports and perform appropriate level and trend analysis. In assessing the ALLL adequacy, examiners should review the institution's ALLL methodology in accordance with outstanding regulatory and accounting pronouncements.

Balance Sheet Composition

The quality, type, and diversification of on- and off-balance sheet items must be considered when reviewing the adequacy of an institution's capital. Risk-weighted capital guidelines and ratios can help examiners determine the adequacy of capital protection, but examiner judgment is required to assess overall capital adequacy. For example, a portfolio of 150 percent risk-weighted HVCRE loans at two different institutions may have different risk characteristics. Additionally, regulatory capital ratios alone do not account for concentration risk, market risk, or risks associated with nontraditional banking activities. Examiner judgment is therefore an integral part of assessing an institution's level of risk and management's ability to adequately manage such risks.

Off-Balance Sheet Risk Exposures

Examiners should consider the risks associated with off-balance sheet activities when evaluating capital. For example, an institution's capital needs can be significantly affected by the volume and nature of activities conducted in a fiduciary capacity. Fiduciary activities, or other nontraditional-banking initiatives, can expose the bank to losses that could affect capital. Similarly, lawsuits against the bank, or other contingent liabilities such as off-balance sheet lending, may indicate a need for greater capital protection and must be carefully reviewed.

Earnings and Dividends

A bank's current and historical earnings record is one of the key elements to consider when assessing capital adequacy. Good earnings performance enables a bank to fund asset growth and remain competitive in the marketplace while at the same time retaining sufficient equity to maintain a strong capital position. The institution's dividend policy is also of importance. Excessive dividends can negate strong earnings performance and result in a weakened capital position, while excessively low dividends may lower the attractiveness of the stock to investors, which can be a detriment should the bank need to raise additional equity. Generally, earnings should first be applied to the elimination of losses and the establishment of necessary reserves and prudent capital levels. Thereafter, dividends can be disbursed in reasonable amounts. Consideration should be given to the extent affiliates rely on or require dividends and other support and the potential impact to the institution's capital position, including in periods of stress.

Asset Growth

Management's ability to adequately plan for and manage growth is important with respect to assessing capital adequacy. A review of past performance and future prospects is a good starting point for this review. The examiner may want to compare asset growth to capital formation during recent periods. The examiner should review the current budget and strategic plan to review growth plans and potential impact to capital adequacy.

Access to Capital Sources

Management's access to capital sources, including existing shareholders and holding company support, is a vital factor in analyzing capital. If management has ample access to capital on reasonable terms, the institution may be able to operate with less capital than an institution without such access. Also, the financial capacity of existing shareholders and strength of a holding company will factor into capital access. If a holding company previously borrowed funds to purchase newly issued stock of a subsidiary bank (a process referred to as double leverage), the holding company may be less able to provide additional capital. The examiner would need to extend beyond standard ratio analysis of the bank to assess management's access to capital sources. For example, examiners can consider current market conditions when assessing the institution's ability to raise capital.

←

RATING THE CAPITAL FACTOR

The adequacy of an institution's capital is one of the elements that examiners must determine to arrive at a composite rating in accordance with the Uniform Financial Institutions Rating System. This determination is a judgmental process that requires examiners to consider all of the subjective and objective variables, concepts, and guidelines that have been discussed throughout this section. Ratings are based on a scale of 1 through 5, with a rating of 1 indicating the strongest performance and risk management practices relative to the institution's size, complexity, and risk profile; and the level of least supervisory concern. A 5 rating indicates the most critically deficient level of performance; inadequate risk management practices relative to the institution's size, complexity, and risk profile; and the greatest supervisory concern.

Uniform Financial Institution Rating System

A financial institution is expected to maintain capital commensurate with the nature and extent of risks to the institution and the ability of management to identify, measure, monitor, and control these risks. The effect of credit, market, and other risks on the institution's financial condition should be considered when evaluating the adequacy of capital. The types and quantity of risk inherent in an institution's activities will determine the extent to which it may be necessary to maintain capital at levels above required regulatory minimums to properly reflect the potentially adverse consequences that these risks may have on the institution's capital. The capital adequacy of an institution is rated based upon, but not limited to, an assessment of the following evaluation factors:

- The level and quality of capital and the overall financial condition of the institution.
- The ability of management to address emerging needs for additional capital.
- The nature, trend, and volume of problem assets, and the adequacy of allowances for loan and lease losses and other valuation reserves.
- Balance sheet composition, including the nature and amount of intangible assets, market risk, concentration risk, and risks associated with nontraditional activities.
- Risk exposure represented by off-balance sheet activities.
- The quality and strength of earnings, and the reasonableness of dividends.
- Prospects and plans for growth, as well as past experience in managing growth.
- Access to capital markets and other sources of capital, including support provided by a parent holding company.

Ratings

A rating of 1 indicates a strong capital level relative to the institution's risk profile.

A rating of 2 indicates a satisfactory capital level relative to the financial institution's risk profile.

A rating of 3 indicates a less than satisfactory level of capital that does not fully support the institution's risk profile. The rating indicates a need for improvement, even if the institution's capital level exceeds minimum regulatory and statutory requirements.

A rating of 4 indicates a deficient level of capital. In light of the institution's risk profile, viability of the institution may be threatened. Assistance from shareholders or other external sources of financial support may be required.

A rating of 5 indicates a critically deficient level of capital such that the institution's viability is threatened. Immediate assistance from shareholders or other external sources of financial support is required.

INTRODUCTION

Asset quality is one of the most critical areas in determining the overall condition of a bank. The primary factor affecting overall asset quality is the quality of the loan portfolio and the credit administration program. Loans typically comprise a majority of a bank's assets and carry the greatest amount of risk to their capital. Securities may also comprise a large portion of the assets and also contain significant risks. Other items which can impact asset quality are other real estate, other assets, off-balance sheet items and, to a lesser extent, cash and due from accounts, and premises and fixed assets.

Management often expends significant time, energy, and resources administering their assets, particularly the loan portfolio. Problems within this portfolio can detract from their ability to successfully and profitably manage other areas of the institution. Examiners should be diligent and focused when reviewing a bank's assets, as they can significantly impact most other facets of bank operations.

EVALUATION OF ASSET QUALITY

The asset quality rating reflects the quantity of existing and potential credit risk associated with the loan and investment portfolios, other real estate owned, and other assets, as well as off-balance sheet transactions. The ability of management to identify and manage credit risk is also reflected here. The evaluation of asset quality should consider the adequacy of the Allowance for Loan and Lease Losses (ALLL) and weigh the exposure to counter-party, issuer, or borrower default under actual or implied contractual agreements. All other risks that may affect the value or marketability of an institution's assets, including, but not limited to, operating, market, reputation, strategic, or compliance risks, should also be considered.

Prior to assigning an asset quality rating, several factors should be considered. The factors should be reviewed within the context of any local and regional conditions that might impact bank performance. Also, any systemic weaknesses, as opposed to isolated problems, should be given appropriate consideration. The following is not a complete list of all possible factors that may influence an examiner's assessment; however, all assessments should consider the following:

- The adequacy of underwriting standards, soundness of credit administration practices, and appropriateness of risk identification practices.
- The level, distribution, severity, and trend of problem, classified, nonaccrual, restructured, delinquent, and nonperforming assets for both on- and off-balance sheet transactions.
- The adequacy of the ALLL and other asset valuation reserves.
- The credit risk arising from or reduced by off-balance sheet transactions, such as unfunded commitments, credit derivatives, commercial and standby letters of credit, and lines of credit.
- The diversification and quality of the loan and investment portfolios.
- The extent of securities underwriting activities and exposure to counter-parties in trading activities.
- The existence of asset concentrations.
- The adequacy of loan and investment policies, procedures, and practices.
- The ability of management to properly administer its assets, including the timely identification and collection of problem assets.
- The adequacy of internal controls and management information systems.
- The volume and nature of credit documentation exceptions.

When assigning component ratings, the above factors, among others, should be evaluated not only according to current adverse classification levels and risk management practices, but also considering any ongoing trends. The same classification levels and management practices might be looked on more or less favorably depending on any improving or deteriorating trends in one or more factors. The examiner should never look at things in a vacuum, instead, noting how the current level or status of each factor relates to previous and expected performance and the performance of other similar institutions.

RATING THE ASSET QUALITY FACTOR

The asset quality rating definitions are applied following a thorough evaluation of existing and potential risks and the mitigation of those risks. The definitions of each rating follow.

A rating of 1 indicates strong asset quality and credit administration practices. Identified weaknesses are minor in nature and risk exposure is modest in relation to capital protection and management's abilities. Asset quality in such institutions is of minimal supervisory concern.

A rating of 2 indicates satisfactory asset quality and credit administration practices. The level and severity of classifications and other weaknesses warrant a limited level of supervisory attention. Risk exposure is commensurate with capital protection and management's abilities.

A rating of 3 is assigned when asset quality or credit administration practices are less than satisfactory. Trends may be stable or indicate deterioration in asset quality or an increase in risk exposure. The level and severity of classified assets, other weaknesses, and risks require an elevated level of supervisory concern. There is generally a need to improve credit administration and risk management practices.

A rating of 4 is assigned to financial institutions with deficient asset quality or credit administration practices. The levels of risk and problem assets are significant, inadequately controlled, and subject the financial institution to potential losses that, if left unchecked, may threaten its viability.

A rating of 5 represents critically deficient asset quality or credit administration practices that present an imminent threat to the institution's viability.

INTRODUCTION

Section 39 of the Federal Deposit Insurance Act, *Standards for Safety and Soundness,* requires each federal banking agency to establish safety and soundness standards for all insured depository institutions. Appendix A to Part 364 of the FDIC Rules and Regulations, *Interagency Guidelines Establishing Standards for Safety and Soundness,* sets standards that institutions are required to follow/adopt. Operational and managerial standards pertaining to an institution's loan portfolio address areas such as asset quality, internal controls, credit underwriting, and loan documentation. The standards are designed to identify potential safety and soundness concerns and to ensure that action is taken to address those concerns before they pose a risk to the Deposit Insurance Fund.

The examiner's evaluation of an institution's lending policies, credit administration, and the quality of the loan portfolio is among the most important aspects of the examination process. To a great extent, the quality of an institution's loan portfolio determines the risk to depositors and to the FDIC's insurance fund. Conclusions regarding the institution's condition and the quality of its management are weighted heavily by the examiner's findings with regard to lending practices. Emphasis on review and evaluation of the loan portfolio and its administration by institution management during examinations recognizes that loans comprise a major portion of most institutions' assets; and, that it is the asset category which ordinarily presents the greatest credit risk and potential loss exposure to banks. Moreover, pressure for increased profitability, liquidity considerations, and a more complex society produce great innovations in credit instruments and approaches to lending. Loans have consequently become more complex. Examiners therefore find it necessary to devote a large portion of time and attention to loan portfolio examination.

←

LOAN ADMINISTRATION

Lending Policies

The examiner's evaluation of the loan portfolio involves much more than merely appraising individual loans. Prudent management and administration of the overall loan account, including establishment of sound lending and collection policies, are of vital importance if the institution is to be continuously operated in an acceptable manner.

Lending policies should be clearly defined and set forth in such a manner as to provide effective supervision by the directors and senior officers. The board of directors of every institution has the legal responsibility to formulate lending policies and to supervise their implementation. Therefore examiners should encourage establishment and maintenance of written, up-to-date lending policies which have been approved by the board of directors. A lending policy should not be a static document, but must be reviewed periodically and revised in light of changing circumstances surrounding the borrowing needs of the institution's customers as well as changes that may occur within the institution itself. To a large extent, the economy of the community served by the institution dictates the composition of the loan portfolio. The widely divergent circumstances of regional economies and the considerable variance in characteristics of individual loans preclude establishment of standard or universal lending policies. There are, however, certain broad areas of consideration and concern that are typically addressed in the lending policies of all banks regardless of size or location. These include the following:

- General fields of lending in which the institution will engage and the kinds or types of loans within each general field;
- Lending authority of each loan officer;
- Lending authority of a loan or executive committee, if any;
- Responsibility of the board of directors in reviewing, ratifying, or approving loans;
- Guidelines under which unsecured loans will be granted;
- Guidelines for rates of interest and the terms of repayment for secured and unsecured loans;
- Limitations on the amount advanced in relation to the value of the collateral and the documentation required by the institution for each type of secured loan;
- Guidelines for obtaining and reviewing real estate appraisals as well as for ordering reappraisals, when needed;
- Maintenance and review of complete and current credit files on each borrower;
- Appropriate collection procedures including, but not limited to, actions to be taken against borrowers who fail to make timely payments;
- Limitations on the maximum volume of loans in relation to total assets;
- Limitations on the extension of credit through overdrafts;
- Description of the institution's normal trade area and circumstances under which the institution may extend credit outside of such area;
- Guidelines that address the goals for portfolio mix and risk diversification and cover the institution's plans for monitoring and taking appropriate corrective action, if deemed necessary, on any concentrations that may exist;

- Guidelines addressing the institution's loan review and grading system ("Watch list");
- Guidelines addressing the institution's review of the Allowance for Loan and Lease Losses (ALLL); and
- Guidelines for adequate safeguards to minimize potential environmental liability.

The above are only guidelines for areas that should be considered during the loan policy evaluation. Examiners should also encourage management to develop specific guidelines for each lending department or function. As with overall lending policies, it is not the FDIC's intent to suggest universal or standard loan policies for specific types of credit. The establishment of these policies is the responsibility of each institution's Board and management. Therefore, the following discussion of basic principles applicable to various types of credit will not include or allude to acceptable ratios, levels, comparisons or terms. These matters should, however, be addressed in each institution's lending policy, and it will be the examiner's responsibility to determine whether the policies are realistic and being followed.

Much of the rest of this section of the Manual discusses areas that should be considered in the institution's lending policies. Guidelines for their consideration are discussed under the appropriate areas.

Loan Review Systems

The terms *loan review system* or *credit risk review system* refer to the responsibilities assigned to various areas such as credit underwriting, loan administration, problem loan workout, or other areas. Responsibilities may include assigning initial credit grades, ensuring grade changes are made when needed, or compiling information necessary to assess the appropriateness of the ALLL.

The complexity and scope of a loan review system will vary based upon an institution's size, type of operations, and management practices. Systems may include components that are independent of the lending function, or may place some reliance on loan officers. Although smaller institutions are not expected to maintain separate loan review departments, it is essential that all institutions have an effective loan review system. Regardless of its complexity, an effective loan review system is generally designed to address the following objectives:

- To promptly identify loans with well-defined credit weaknesses so that timely action can be taken to minimize credit loss;
- To provide essential information for determining the appropriateness of the ALLL;
- To identify relevant trends affecting the collectibility of the loan portfolio and isolate potential problem areas;
- To evaluate the activities of lending personnel;
- To assess the adequacy of, and adherence to, loan policies and procedures, and to monitor compliance with relevant laws and regulations;
- To provide the board of directors and senior management with an objective assessment of the overall portfolio quality; and
- To provide management with information related to credit quality that can be used for financial and regulatory reporting purposes.

Credit Risk Rating or Grading Systems

Accurate and timely credit grading is a primary component of an effective loan review system. Credit grading involves an assessment of credit quality, the identification of problem loans, and the assignment of risk ratings. An effective system provides information for use in establishing an allowance for specific credits and for the determination of an overall ALLL level.

Credit grading systems often place primary reliance on loan officers for identifying emerging credit problems. However, given the importance and subjective nature of credit grading, a loan officer's judgement regarding the assignment of a particular credit grade should generally be subject to review. Reviews may be performed by peers, superiors, loan committee(s), or other internal or external credit review specialists. Credit grading reviews performed by individuals independent of the lending function are preferred because they can often provide a more objective assessment of credit quality. A loan review system typically includes the following:

- A formal credit grading system that can be reconciled with the framework used by Federal regulatory agencies;
- An identification of loans or loan pools that warrant special attention;
- A mechanism for reporting identified loans, and any corrective action taken, to senior management and the board of directors; and
- Documentation of an institution's credit loss experience for various components of the loan and lease portfolio.

Loan Review System Elements

Loan review policies are typically reviewed and approved at least annually by the board of directors. Policy guidelines include a written description of the overall credit grading process, and establish responsibilities for the various loan review functions. The policy generally addresses the following items:

- Qualifications of loan review personnel;
- Independence of loan review personnel;
- Frequency of reviews;
- Scope of reviews;
- Depth of reviews;
- Review of findings and follow-up; and
- Workpaper and report distribution.

Qualifications of Loan Review Personnel

Personnel to involve in the loan review function are qualified based on level of education, experience, and extent of formal training. They are knowledgeable of both sound lending practices and their own institution's specific lending guidelines. In addition, they are knowledgeable of pertinent laws and regulations that affect lending activities.

Loan Review Personnel Independence

Loan officers are generally responsible for ongoing credit analysis and the prompt identification of emerging problems. Because of their frequent contact with borrowers, loan officers can usually identify potential problems before they become apparent to others. However, institutions should be careful to avoid over reliance upon loan officers. To avoid conflicts of interest, management typically ensures that, when feasible, all significant loans are reviewed by individuals that are not part of, or influenced by anyone associated with, the loan approval process.

Larger institutions typically establish separate loan review departments staffed by independent credit analysts. Cost and volume considerations may not justify such a system in smaller institutions. Often, members of senior management that are independent of the credit administration process, a committee of outside directors, or an outside loan review consultant fill this role. Regardless of the method used, loan review personnel should report their findings directly to the board of directors or a board committee.

Frequency of Reviews

The loan review function provides feedback on the effectiveness of the lending process in identifying emerging problems. Reviews of significant credits are generally performed annually, upon renewal, or more frequently when factors indicate a potential for deteriorating credit quality. A system of periodic reviews is particularly important to the ALLL determination process.

Scope of Reviews

Reviews typically cover all loans that are considered significant. In addition to loans over a predetermined size, management will normally review smaller loans that present elevated risk characteristics such as credits that are delinquent, on nonaccrual status, restructured as a troubled debt, previously classified, or designated as Special Mention. Additionally, management may wish to periodically review insider loans, recently renewed credits, or loans affected by common repayment factors. The percentage of the portfolio selected for review should provide reasonable assurance that all major credit risks have been identified.

Depth of Reviews

Loan reviews typically analyze a number of important credit factors, including:

- Credit quality;
- Sufficiency of credit and collateral documentation;
- Proper lien perfection;
- Proper loan approval;
- Adherence to loan covenants;
- Compliance with internal policies and procedures, and applicable laws and regulations; and
- The accuracy and timeliness of credit grades assigned by loan officers.

Review of Findings and Follow-up

Loan review findings should be reviewed with appropriate loan officers, department managers, and members of senior management. Typically, any existing or planned corrective action (including estimated timeframes) is obtained for all noted deficiencies, with those deficiencies that remain unresolved reported to senior management and the board of directors.

Workpaper and Report Distribution

A list of the loans reviewed, including the review date, and documentation supporting assigned ratings is commonly prepared. A report that summarizes the results of the review is typically submitted to the board at least quarterly. Findings usually address adherence to internal policies and procedures, and applicable laws and regulations, so that deficiencies can be remedied in a timely manner. Examiners should review the written response from management in response to any substantive criticisms or recommendations and assess corrective actions taken.

Allowance for Loan and Lease Losses (ALLL)

Each institution must maintain an ALLL that is appropriate to absorb estimated credit losses associated with the held for investment loan and lease portfolio, i.e., loans and leases that the institution has the intent and ability to hold for the foreseeable future or until maturity or payoff. Each institution should also maintain, as a separate liability account, an allowance sufficient to absorb estimated credit losses associated with off-balance sheet credit instruments such as loan commitments, standby letters of credit, and guarantees. This separate liability account for estimated credit losses on off-balance sheet credit exposures should not be reported as part of the ALLL on an institution's balance sheet. Loans and leases held for sale are carried on the balance sheet at the lower of cost or fair value, with a separate valuation allowance. This separate valuation allowance should not be included as part of the ALLL and accordingly regulatory capital.

The term "estimated credit losses" means an estimate of the current amount of the loan and lease portfolio (net of unearned income) that is not likely to be collected; that is, net charge-offs that are likely to be realized for a loan, or pool of loans. The estimated credit losses should meet the criteria for accrual of a loss contingency (i.e., a provision to the ALLL) set forth in generally accepted accounting principles (U.S. GAAP). When available information confirms specific loans and leases, or portions thereof, to be uncollectible, these amounts should be promptly charged-off against the ALLL.

Estimated credit losses should reflect consideration of all significant factors that affect repayment as of the evaluation date. Estimated losses on loan pools should reflect historical net charge-off levels for similar loans, adjusted for changes in current conditions or other relevant factors. Calculation of historical charge-off rates can range from a simple average of net charge-offs over a relevant period, to more complex techniques, such as migration analysis.

Portions of the ALLL can be attributed to, or based upon the risks associated with, individual loans or groups of loans. However, the ALLL is available to absorb credit losses that arise from the entire portfolio. It is not segregated for any particular loan, or group of loans.

Responsibility of the Board and Management

It is the responsibility of the board of directors and management to maintain the ALLL at an appropriate level. The allowance should be evaluated, and appropriate provisions made, at least quarterly. In carrying out their responsibilities, the board and management are expected to:

- Establish and maintain a loan review system that identifies, monitors, and addresses asset quality problems in a timely manner.
- Ensure the prompt charge-off of loans, or portions of loans, deemed uncollectible.
- Ensure that the process for determining an appropriate allowance level is based on comprehensive, adequately documented, and consistently applied analysis.

For purposes of Reports of Condition and Income (Call Reports) an appropriate ALLL for loans held for investment should consist of the following items:

- The amount of allowance related to loans individually evaluated and determined to be impaired under ASC (Accounting Standards Codification) Subtopic 310-10, *Receivables - Overall*.
- The amount of allowance related to loans that were individually evaluated for impairment and determined not to be impaired, as well as other loans collectively evaluated under ASC Subtopic 450-20, *Contingencies – Loss Contingencies*.
- The amount of allowance related to loans evaluated under ASC Subtopic 310-30, *Receivables –Loans and Debt Securities Acquired with Deteriorated Credit Quality*.
- The amount of allowance related to international transfer risk associated with its cross-border lending exposure.

Furthermore, management's analysis of an appropriate allowance level requires significant judgement in determining estimates of credit losses. An institution may support its estimate through qualitative factors that adjust historical loss rates or an unallocated portion that can be supported through a similar analysis.

When determining an appropriate allowance, primary reliance should normally be placed on analysis of the various components of a portfolio, including all significant credits reviewed on an individual basis. Examiners should refer to ASC Subtopic 310-10 for guidance in establishing an allowance for individually evaluated loans determined to be impaired and measured under that standard. When analyzing the appropriateness of an allowance, portfolios evaluated collectively should group loans with similar characteristics, such as risk classification, past due status, type of loan, industry, or collateral. A depository institution may, for example, analyze the following groups of loans and provide for them in the ALLL:

- Significant credits reviewed on an individual basis (i.e., impaired loans);

- Loans and leases that are not reviewed individually, but which present elevated risk characteristics, such as delinquency, adverse classification, or Special Mention designation;
- Homogenous loans that are not reviewed individually, and do not present elevated risk characteristics; and
- All other loans that have not been considered or provided for elsewhere.

In addition to estimated credit losses, the losses that arise from the transfer risk associated with an institution's cross-border lending activities require special consideration. Over and above any minimum amount that is required by the Interagency Country Exposure Review Committee to be provided in the Allocated Transfer Reserve (or charged to the ALLL), an institution must determine if their ALLL is appropriate to absorb estimated losses from transfer risk associated with its cross-border lending exposure.

Factors to Consider in Estimating Credit Losses

Estimated credit losses should reflect consideration of all significant factors that affect the portfolio's collectibility as of the evaluation date. While historical loss experience provides a reasonable starting point, historical losses, or even recent trends in losses, are not by themselves, a sufficient basis to determine an appropriate ALLL level. Management should also consider any relevant qualitative factors that are likely to cause estimated losses to differ from historical loss experience such as:

- Changes in lending policies and procedures, including underwriting, collection, charge-off and recovery practices;
- Changes in local and national economic and business conditions;
- Changes in the volume or type of credit extended;
- Changes in the experience, ability, and depth of lending management;
- Changes in the volume and severity of past due, nonaccrual, troubled debt restructurings, or classified loans;
- Changes in the quality of an institution's loan review system or the degree of oversight by the board of directors; and,
- The existence of, or changes in the level of, any concentrations of credit.

Institutions are also encouraged to use ratio analysis as a supplemental check for evaluating the overall reasonableness of an ALLL. Ratio analysis can be useful in identifying trends in the relationship of the ALLL to classified and nonclassified credits, to past due and nonaccrual loans, to total loans and leases and binding commitments, and to historical charge-off levels. However, while such comparisons can be helpful as a supplemental check of the reasonableness of management's assumptions and analysis, they are not, by themselves, a sufficient basis for determining an appropriate ALLL. Such comparisons do not eliminate the need for a comprehensive analysis and documentation of the loan and lease portfolio and the factors affecting its collectibility.

Examiner Responsibilities

Generally, following the quality assessment of the loan and lease portfolio, the loan review system, and the lending policies, examiners are responsible for assessing the appropriateness of the ALLL. Examiners should consider all significant factors that affect the collectibility of the portfolio. Examination procedures for reviewing the appropriateness of the ALLL are included in the Examination Documentation (ED) Modules.

In assessing the overall appropriateness of an ALLL, it is important to recognize that the related process, methodology, and underlying assumptions require a substantial degree of judgement. Credit loss estimates will not be precise due to the wide range of factors that must be considered. Furthermore, the ability to estimate credit losses on specific loans and categories of loans should improve over time. Therefore, examiners will generally accept management's estimates of credit losses in their assessment of the overall appropriateness of the ALLL when management has:

- Maintained effective systems and controls for identifying, monitoring and addressing asset quality problems in a timely manner;
- Analyzed all significant factors that affect the collectibility of the portfolio; and
- Established an acceptable ALLL evaluation process that meets the objectives for an appropriate ALLL.

If, after the completion of all aspects of the ALLL review described in this section, the examiner does not concur that the reported ALLL level is appropriate, or the ALLL evaluation process is deficient, recommendations for correcting these problems, including any examiner concerns regarding an appropriate level for the ALLL, should be noted in the Report of Examination.

Regulatory Reporting of the ALLL

An ALLL established in accordance with the guidelines provided above should fall within a range of acceptable estimates. When an ALLL is not deemed at an appropriate level, management will be required to increase the provision for loan and lease loss expense sufficiently to restore the ALLL reported in its Call Report to an appropriate level.

Accounting and Reporting Treatment

ASC Subtopic 450-20 provides the basic guidance for recognition of a loss from a contingency that should be accrued through a charge to income (i.e., a provision expense) when available information indicates that it is probable the asset has been impaired and the amount is reasonably estimated. ASC Subtopic 310-10 provides specific guidance about the measurement and disclosure for loans individually evaluated and determined to be impaired. Loans are considered to be impaired when, based on current information and events, it is probable that the creditor will be unable to collect all interest and principal payments due according to the contractual terms of the loan agreement. This would generally include all loans restructured as a troubled debt and nonaccrual loans.

For individually impaired loans, ASC Subtopic 310-10 provides guidance on the acceptable methods to measure impairment. Specifically, this standard states that when a loan is impaired, a creditor should measure impairment based on the present value of expected future cash flows discounted at the loan's effective interest rate, except that as a practical expedient, a creditor may measure impairment based on a loan's observable market price. However, the Call Report instructions require an institution to use the fair value of the collateral in its determination of impairment for all impaired collateral dependent loans. When developing the estimate of expected future cash flows for a loan, an institution should consider all available information reflecting past events and current conditions, including the effect of existing qualitative factors.

Large groups of smaller-balance homogenous loans are *not* included in the scope of ASC Subtopic 310-10, unless the loan is a troubled debt restructuring. Such groups of loans may include, but are not limited to, credit card, residential mortgage, and consumer installment loans. Examiners should refer to ASC Subtopic 450-20 for loans collectively evaluated for impairment, as well as individual loans that are identified for evaluation on an individual basis and determined not to be impaired.

Institutions should not layer their loan loss allowances. Layering is the inappropriate practice of recording estimates in the ALLL for the same loan under the different accounting standards. Layering can happen when an institution measures impairment on an individually impaired loan and includes that same loan in its estimate of loan losses on a collective basis, thereby estimating the loan loss for the same loan twice.

While different institutions may use different methods, there are certain common elements that should be included in any ALLL methodology. Generally, an institution's methodology should:

- Include a detailed loan portfolio analysis, performed regularly;
- Consider all loans (whether on an individual or group basis);
- Identify loans to be evaluated for impairment on an individual basis under ASC Subtopic 310-10; loans evaluated under ASC Subtopic 310-30; and segment the remainder of the portfolio into groups of loans with similar risk characteristics for evaluation and analysis under ASC Subtopic 450-20;
- Consider all known relevant internal and external factors that may affect loan collectibility;
- Be applied consistently but, when appropriate, be modified for new factors affecting collectibility;
- Consider the particular risks inherent in different kinds of lending;
- Consider current collateral values (less costs to sell), where applicable;
- Require that analyses, estimates, reviews and other ALLL methodology functions be performed by competent and well-trained personnel;
- Be based on current and reliable data;
- Be well-documented, in writing, with clear explanations of the supporting analyses and rationale; and,
- Include a systematic and logical method to consolidate the loss estimates and ensure the ALLL balance is recorded in accordance with U.S. GAAP.

A systematic methodology that is properly designed and implemented should result in an institution's best estimate of the ALLL. Accordingly, institutions should adjust their ALLL balance, either upward or downward, in each period for differences between the results of the systematic determination process and the unadjusted ALLL balance in the general ledger.

Examiners are encouraged, with the acknowledgement of management, to communicate with an institution's external auditors and request an explanation of their rationale and findings, when differences in judgment concerning the appropriateness of the institution's ALLL exist. In case of controversy, an institution and its auditor may be reminded when an institution's supervisory agency's interpretation on how U.S. GAAP should be applied to a specified event or transaction (or series of related events or transactions) differs from the institution's interpretation, the supervisory agency may require the institution to reflect the event(s) or transaction(s) in its Call Report in accordance with the agency's interpretation and to amend previously submitted reports.

Additional information on the documentation of the ALLL, including its methodology, and the establishment of loan review systems is provided in the Interagency Statement of Policy on the Allowance for Loan and Lease Losses, (including frequently asked questions) dated December 13, 2006, and the Interagency Policy Statement on Allowance for Loan and Lease Losses Methodologies and Documentation for Banks and Savings Associations, dated July 2, 2001.

PORTFOLIO COMPOSITION

Commercial Loans

General

Loans to business enterprises for commercial or industrial purposes, whether proprietorships, partnerships or corporations, are commonly described as commercial loans. In asset distribution, commercial or business loans frequently comprise one of the most important assets of an institution. They may be secured or unsecured and have short or long-term maturities. Such loans include working capital advances, term loans and loans to individuals for business purposes.

Short-term working capital and seasonal loans provide temporary capital in excess of normal needs. They are used to finance seasonal requirements and are repaid at the end of the cycle by converting inventory and accounts receivable into cash. Such loans may be unsecured; however, many working capital loans are advanced with accounts receivable and/or inventory as collateral. Firms engaged in manufacturing, distribution, retailing and service-oriented businesses use short-term working capital loans.

Term business loans have assumed increasing importance. Such loans normally are granted for the purpose of acquiring capital assets, such as plant and equipment. Term loans may involve a greater risk than do short-term advances, because of the length of time the credit is outstanding. Because of the potential for greater risk, term loans are usually secured and generally require regular amortization. Loan agreements on such credits may contain restrictive covenants during the life of the loan. In some instances, term loans may be used as a means of liquidating, over a period of time, the accumulated and unpaid balance of credits originally advanced for seasonal needs. While such loans may reflect a borrower's past operational problems, they may well prove to be the most viable means of salvaging a problem situation and effecting orderly debt collection.

Commercial lending policies generally address acquisition of credit information, such as property, operating and cash flow statements; factors that might determine the need for collateral acquisition; acceptable collateral margins; perfecting liens on collateral; lending terms, and charge-offs.

Accounts Receivable Financing

Accounts receivable financing is a specialized area of commercial lending in which borrowers assign their interests in accounts receivable to the lender as collateral. Typical characteristics of accounts receivable borrowers are those businesses that are growing rapidly and need year-round financing in amounts too large to justify unsecured credit, those that are nonseasonal and need year-round financing because working capital and profits are insufficient to permit periodic cleanups, those whose working capital is inadequate for the volume of sales and type of operation, and those whose previous unsecured borrowings are no longer warranted because of various credit factors.

Several advantages of accounts receivable financing from the borrower's viewpoint are: it is an efficient way to finance an expanding operation because borrowing capacity expands as sales increase; it permits the borrower to take advantage of purchase discounts because the company receives immediate cash on its sales and is able to pay trade creditors on a satisfactory basis; it insures a revolving, expanding line of credit; and actual interest paid may be no more than that for a fixed amount unsecured loan.

Advantages from the institution's viewpoint are: it generates a relatively high yield loan, new business, and a depository relationship; permits continuing banking relationships with long-standing customers whose financial conditions no longer warrant unsecured credit; and minimizes potential loss when the loan is geared to a percentage of the accounts receivable collateral. Although accounts receivable loans are collateralized, it is important to analyze the borrower's financial statements. Even if the collateral is of good quality and in excess of the loan, the borrower must demonstrate financial progress. Full repayment through collateral liquidation is normally a solution of last resort.

Institutions use two basic methods to make accounts receivable advances. First, blanket assignment, wherein the borrower periodically informs the institution of the amount of receivables outstanding on its books. Based on this information, the institution advances the agreed percentage of the outstanding receivables. The receivables are usually pledged on a non-notification basis and payments on receivables are made directly to the borrower who then remits them to the institution. The institution applies all or a portion of such funds to the borrower's loan. Second, ledgering the accounts, wherein the lender receives duplicate copies of the invoices together with the shipping documents and/or delivery receipts. Upon receipt of satisfactory information, the institution advances the agreed percentage of the outstanding receivables. The receivables are usually pledged on a notification basis. Under this method, the institution maintains complete control of the funds paid on all accounts pledged by requiring the borrower's customer to remit directly to the institution.

In the area of accounts receivable financing, an institution's lending policy typically addresses the acquisition of credit information such as property, operating and cash flow statements. It also typically addresses maintenance of an accounts receivable loan agreement that establishes a percentage advance against acceptable receivables, a maximum dollar amount due from any one account debtor, financial strength of debtor accounts, insurance that "acceptable receivables" are defined in light of the turnover of receivables pledged, aging of accounts receivable, and concentrations of debtor accounts.

Leveraged Lending

The Federal institution regulatory agencies initially issued guidance on April 9, 2001, concerning sound risk management practices for institutions engaged in leveraged financing. In light of the developments and experience gained since the initial guidance was issued, the Federal institution regulatory agencies issued new Interagency Guidance on Leveraged Lending on May 21, 2013, to update and replace the 2001 guidance. Examiners should also review the related Frequently Asked Questions (FAQ) issued on November 7, 2014.

Applicability

A financial institution’s risk management practices should be consistent with the size and risk profile of its leveraged activities relative to its assets, earnings, liquidity, and capital. Institutions that originate or sponsor leveraged transactions can refer to the guidance for suggestions about sound risk management principles.

The agencies do not intend for a financial institution that originates a small number of less complex, leveraged loans to have policies and procedures commensurate with a larger, more complex leveraged loan origination business. However, any financial institution that participates in leveraged lending transactions may refer to and consider supervisory guidance provided in the “Participations Purchased” section of the guidance.

General

Leveraged lending is an important type of financing for national and global economies, and the U.S. financial industry plays an integral role in making credit available and syndicating that credit to investors. In particular, financial institutions should ensure they do not unnecessarily heighten risks by originating poorly underwritten loans. For example, a poorly underwritten leveraged loan that is pooled with other loans or is participated with other institutions may generate risks for the financial system.

Numerous definitions of leveraged lending exist throughout the financial services industry and commonly contain some combination of the following:

- Proceeds used for buyouts, acquisitions, or capital distributions.
- Transactions where the borrower’s Total Debt divided by EBITDA (earnings before interest, taxes, depreciation, and amortization) or Senior Debt divided by EBITDA exceed 4.0X EBITDA or 3.0X EBITDA, respectively, or other defined levels appropriate to the industry or sector.
- A borrower recognized in the debt markets as a highly leveraged firm, which is characterized by a high debt-to-net-worth ratio.
- Transactions when the borrower’s post-financing leverage, as measured by its leverage ratios (for example, debt-to-assets, debt-to-net-worth, debt-to-cash flow, or other similar standards common to particular industries or sectors), significantly exceeds industry norms or historical levels.

A financial institution engaging in leveraged lending typically defines the activity within its policies and procedures in a manner sufficiently detailed to ensure consistent application across all business lines. An appropriate definition describes clearly the purposes and financial characteristics common to these transactions, and covers risk from both direct exposure and indirect exposure via limited recourse financing secured by leveraged loans, or financing extended to financial intermediaries (such as conduits and special purpose entities (SPEs)) that hold leveraged loans.

In general, supervisory expectations for sound risk management of leveraged lending activities places importance on institutions developing and maintaining the following:

- Transactions structured to reflect a sound business premise, an appropriate capital structure, and reasonable cash flow and balance sheet leverage. Combined with supportable performance projections, these elements of a safe-and-sound loan structure should clearly support a borrower's capacity to repay and to de-lever to a sustainable level over a reasonable period, whether underwritten to hold or distribute;
- A definition of leveraged lending that facilitates consistent application across all business lines;
- Well-defined underwriting standards that, among other things, define acceptable leverage levels and describe amortization expectations for senior and subordinate debt;
- A credit limit and concentration framework consistent with the institution's risk appetite;
- Sound Management Information Systems (MIS) that enable management to identify, aggregate, and monitor leveraged exposures and comply with policy across all business lines;
- Strong pipeline management policies and procedures that, among other things, provide for real-time information on exposures and limits, and exceptions to the timing of expected distributions and approved hold levels; and,
- Guidelines for conducting periodic portfolio and pipeline stress tests to quantify the potential impact of economic and market conditions on the institution's asset quality, earnings, liquidity, and capital.

Risk Management Framework

Given the high-risk profile of leveraged transactions, prudent financial institutions engaged in leveraged lending adopt a risk management framework that has an intensive and frequent review and monitoring process. The framework has as its foundation written risk objectives, risk acceptance criteria, and risk controls. A lack of robust risk management processes and controls at a financial institution with significant leveraged lending activities could contribute to supervisory findings that the financial institution is engaged in unsafe-and-unsound banking practices.

General Policy Expectations

A financial institution's credit policies and procedures for leveraged lending generally address the following:

- Identification of the financial institution's risk appetite including clearly defined amounts of leveraged lending that the institution is willing to underwrite (for example, pipeline limits) and is willing to retain (for example, transaction and aggregate hold levels). The designated risk appetite is commonly supported by an analysis of the potential effect on earnings, capital, liquidity, and other risks that result from these positions, and is approved by the board of directors;
- A limit framework that includes limits or guidelines for single obligors and transactions, aggregate hold portfolio, aggregate pipeline exposure, and industry and geographic concentrations. This limit framework identifies the related management approval authorities and exception tracking provisions. In addition to notional pipeline limits, financial institutions with significant leveraged transactions implement underwriting limit frameworks that assess stress losses, flex terms, economic capital usage, and earnings at risk or that otherwise provide a more nuanced view of potential risk;
- Procedures for ensuring the risks of leveraged lending activities are appropriately reflected in an institution's allowance for loan and lease losses (ALLL) and capital adequacy analyses;
- Credit and underwriting approval authorities, including the procedures for approving and documenting changes to approved transaction structures and terms;
- Guidelines for appropriate oversight by senior management, including adequate and timely reporting to the board of directors;
- Expected risk-adjusted returns for leveraged transactions;
- Minimum underwriting standards (see "Underwriting Standards" section below); and,
- Effective underwriting practices for primary loan origination and secondary loan acquisition.

Participations Purchased

Financial institutions purchasing participations and assignments in leveraged lending transactions should make a thorough, independent evaluation of the transaction and the risks involved before committing any funds. They should apply the same standards of prudence, credit assessment and approval criteria, and in-house limits that would be employed if the purchasing organization were originating the loan. Policies typically include requirements for:

- Obtaining and independently analyzing full credit information both before the participation is purchased and on a timely basis thereafter;
- Obtaining from the lead lender copies of all executed and proposed loan documents, legal opinions, title insurance policies, Uniform Commercial Code (UCC) searches, and other relevant documents;
- Carefully monitoring the borrower's performance throughout the life of the loan; and,

- Establishing appropriate risk management guidelines as described in this document.

Underwriting Standards

A financial institution's underwriting standards should be clear, written and measurable, and should accurately reflect the institution's risk appetite for leveraged lending transactions. A financial institution should have clear underwriting limits regarding leveraged transactions, including the size that the institution will arrange both individually and in the aggregate for distribution. The originating institution should be mindful of reputational risks associated with poorly underwritten transactions, as these risks may find their way into a wide variety of investment instruments and exacerbate systemic risks within the general economy. An institution's underwriting standards typically consider the following:

- Whether the business premise for each transaction is sound and the borrower's capital structure is sustainable regardless of whether the transaction is underwritten for the institution's own portfolio or with the intent to distribute.
- A borrower's capacity to repay and ability to de-lever to a sustainable level over a reasonable period.
- Expectations for the depth and breadth of due diligence on leveraged transactions.
- Standards for evaluating expected risk-adjusted returns.
- The degree of reliance on enterprise value and other intangible assets for loan repayment, along with acceptable valuation methodologies, and guidelines for the frequency of periodic reviews of those values;
- Expectations for the degree of support provided by the sponsor (if any), taking into consideration the sponsor's financial capacity, the extent of its capital contribution at inception, and other motivating factors.
- Whether credit agreement terms allow for the material dilution, sale, or exchange of collateral or cash flow-producing assets without lender approval;
- Credit agreement covenant protections, including financial performance (such as debt-to-cash flow, interest coverage, or fixed charge coverage), reporting requirements, and compliance monitoring.
- Collateral requirements in credit agreements that specify acceptable collateral and risk-appropriate measures and controls, including acceptable collateral types, loan-to-value guidelines, and appropriate collateral valuation methodologies. Standards for asset-based loans that are part of the entire debt structure also should outline expectations for the use of collateral controls (for example, inspections, independent valuations, and payment lockbox), other types of collateral and account maintenance agreements, and periodic reporting requirements; and,
- Whether loan agreements provide for distribution of ongoing financial and other relevant credit information to all participants and investors.

Credit Analysis

Effective underwriting and management of leveraged lending risk is highly dependent on the quality of analysis employed during the approval process as well as ongoing monitoring. An institution's analysis of leveraged lending transactions typically ensures that:

- Cash flow analyses do not rely on overly optimistic or unsubstantiated projections of sales, margins, and merger and acquisition synergies;
- Liquidity analyses include performance metrics appropriate for the borrower's industry; predictability of the borrower's cash flow; measurement of the borrower's operating cash needs; and ability to meet debt maturities;
- Projections exhibit an adequate margin for unanticipated merger-related integration costs;
- Projections are stress tested for one or two downside scenarios, including a covenant breach;
- Transactions are reviewed at least quarterly to determine variance from plan, the related risk implications, and the accuracy of risk ratings and accrual status;
- Enterprise and collateral valuations are independently derived or validated outside of the origination function, are timely, and consider potential value erosion;
- Collateral liquidation and asset sale estimates are based on current market conditions and trends;
- Potential collateral shortfalls are identified and factored into risk rating and accrual decisions;
- Contingency plans anticipate changing conditions in debt or equity markets when exposures rely on refinancing or the issuance of new equity; and
- The borrower is adequately protected from interest rate and foreign exchange risk.

Valuation Standards

Institutions often rely on enterprise value and other intangibles when (1) evaluating the feasibility of a loan request; (2) determining the debt reduction potential of planned asset sales; (3) assessing a borrower's ability to access the capital markets; and, (4) estimating the strength of a secondary source of repayment. Institutions may also view enterprise value as a useful benchmark for assessing a sponsor's economic incentive to provide financial support. Given the specialized knowledge needed for the development of a credible enterprise valuation and the importance of enterprise valuations in the underwriting and ongoing risk assessment processes, enterprise valuations should be performed by qualified persons independent of an institution's origination function.

There are several methods used for valuing businesses. The most common valuation methods are assets, income, and market. Asset valuation methods consider an enterprise's underlying assets in terms of its net going-concern or liquidation value. Income valuation methods consider an enterprise's ongoing cash flows or earnings and apply appropriate capitalization or discounting techniques. Market valuation methods derive value multiples from comparable company data or sales transactions. However, final value estimates should be based on the method or methods that give supportable and credible results. In many cases, the income method is generally considered the most reliable.

There are two common approaches employed when using the income method. The "capitalized cash flow" method determines the value of a company as the present value of all future cash flows the business can generate in perpetuity. An appropriate cash flow is determined and then divided by a risk-adjusted capitalization rate, most commonly the weighted average cost of capital. This method is most appropriate when cash flows are predictable and stable. The "discounted cash flow" method is a multiple-period valuation model that converts a future series of cash flows into current value by discounting those cash flows at a rate of return (referred to as the "discount rate") that reflects the risk inherent therein. This method is most appropriate when future cash flows are cyclical or variable over time. Both income methods involve numerous assumptions, and therefore, supporting documentation should fully explain the evaluator's reasoning and conclusions.

When a borrower is experiencing a financial downturn or facing adverse market conditions, a prudent lender will reflect those adverse conditions in its assumptions for key variables such as cash flow, earnings, and sales multiples when assessing enterprise value as a potential source of repayment. Changes in the value of a borrower's assets are typically tested under a range of stress scenarios, including business conditions more adverse than the base case scenario. Stress tests of enterprise values and their underlying assumptions are generally conducted and documented at origination of the transaction and periodically thereafter, incorporating the actual performance of the borrower and any adjustments to projections. Prudent institutions perform their own discounted cash flow analysis to validate the enterprise value implied by proxy measures such as multiples of cash flow, earnings, or sales.

Enterprise value estimates derived from even the most rigorous procedures are imprecise and ultimately may not be realized. Therefore, institutions relying on enterprise value or illiquid and hard-to-value collateral typically have policies that provide for appropriate loan-to-value ratios, discount rates, and collateral margins. Based on the nature of an institution's leveraged lending activities, the prudent institution establishes limits for the proportion of individual transactions and the total portfolio that are supported by enterprise value. Regardless of the methodology used, the assumptions underlying enterprise-value estimates typically are clearly documented, well supported, and understood by the institution's appropriate decision-makers and risk oversight units. Further, an institution's valuation methods are appropriate for the borrower's industry and condition.

Risk Rating Leveraged Loans

The risk rating of leveraged loans involves the use of realistic repayment assumptions to determine a borrower's ability to de-lever to a sustainable level within a reasonable period of time. For example, supervisors commonly assume that the ability to fully amortize senior secured debt or the ability to repay at least 50 percent of total debt over a five-to-seven year period provides evidence of adequate repayment capacity. If the projected capacity to pay down debt from cash flow is nominal with refinancing the only viable option, the credit will usually be adversely rated even if it has been recently underwritten. In cases when leveraged loan transactions have no reasonable or realistic prospects to de-lever, a Substandard rating is likely. Furthermore, when assessing debt service capacity, extensions and restructures should be scrutinized to ensure that the institution is not merely masking repayment capacity problems by extending or restructuring the loan.

If the primary source of repayment becomes inadequate, it would generally be inappropriate for an institution to consider enterprise value as a secondary source of repayment unless that value is well supported. Evidence of well-supported value may include binding purchase and sale agreements with qualified third parties or thorough asset valuations that fully consider the effect of the borrower's distressed circumstances and potential changes in business and market conditions. For such borrowers, when a portion of the loan may not be protected by pledged assets or a well-supported enterprise value, examiners generally will rate that portion Doubtful or Loss and place the loan on nonaccrual status.

Risks in leveraged lending activities are considered in the ALLL and capital adequacy analysis. For allowance purposes, leverage exposures should be taken into account either through analysis of the estimated credit losses from the discrete portfolio or as part of an overall analysis of the portfolio utilizing the institution's internal risk grades or other factors. At the transaction level, exposures heavily reliant on enterprise value as a secondary source of repayment should be scrutinized to determine the need for and adequacy of specific allocations.

Problem Credit Management

Individual action plans are typically formulated by management when working with borrowers experiencing diminished operating cash flows, depreciated collateral values, or other significant plan variances. Weak initial underwriting of transactions, coupled with poor structure and limited covenants, may make problem credit discussions and eventual restructurings more difficult for an institution as well as result in less favorable outcomes.

A financial institution generally formulates credit policies that define expectations for the management of adversely rated and other high-risk borrowers whose performance departs significantly from planned cash flows, asset sales, collateral values, or other important targets. These policies should stress the need for workout plans that contain quantifiable objectives and measureable time frames. Actions may include working with the borrower for an orderly resolution while preserving the institution's interests, sale of the credit in the secondary market, or liquidation of collateral. Problem credits should be reviewed regularly for risk rating accuracy, accrual status, recognition of impairment through specific allocations, and charge-offs.

Reporting and Analytics

Diligent financial institutions regularly monitor higher risk credits, including leveraged loans. Monitoring includes management's review of comprehensive reports about the characteristics and trends in such exposures at least quarterly, with summaries provided to the board of directors. Policies and procedures typically identify the fields to be populated and captured by a financial institution's MIS, which then yields accurate and timely reporting to management and the board of directors that may include the following:

- Individual and portfolio exposures within and across all business lines and legal vehicles, including the pipeline;
- Risk rating distribution and migration analysis, including maintenance of a list of those borrowers who have been removed from the leveraged portfolio due to improvements in their financial characteristics and overall risk profile;
- Industry mix and maturity profile;
- Metrics derived from probabilities of default and loss given default;
- Portfolio performance measures, including noncompliance with covenants, restructurings, delinquencies, non-performing amounts, and charge-offs;
- Amount of impaired assets and the nature of impairment, and the amount of the ALLL attributable to leveraged lending;
- The aggregate level of policy exceptions and the performance of that portfolio;
- Exposures by collateral type, including unsecured transactions and those where enterprise value will be the source of repayment for leveraged loans. Reporting should also consider the implications of defaults that trigger pari passu treatment for all lenders and, thus, dilute the secondary support from the sale of collateral;
- Secondary market pricing data and trading volume, when available;
- Exposures and performance by deal sponsors. Deals introduced by sponsors may, in some cases, be considered exposure to related borrowers. An institution should identify, aggregate, and monitor potential related exposures;
- Gross and net exposures, hedge counterparty concentrations, and policy exceptions;
- Actual versus projected distribution of the syndicated pipeline, with regular reports of excess levels over the hold targets for the syndication inventory. Pipeline definitions should clearly identify the type of exposure. This includes committed exposures that have not been accepted by the borrower, commitments accepted but not closed, and funded and unfunded commitments that have closed but have not been distributed;
- Total and segmented leveraged lending exposures, including subordinated debt and equity holdings, alongside established limits. Reports should provide a detailed and comprehensive view of global exposures, including situations when an institution has indirect exposure to an obligor or is holding a previously sold position as collateral or as a reference asset in a derivative;
- Borrower and counterparty leveraged lending reporting should consider exposures booked in other business units throughout the institution, including indirect exposures such as default swaps and total return swaps, naming the distributed paper as a covered or referenced asset or collateral exposure through repo transactions. Additionally, the institution should consider positions in the held for sale or traded portfolios or through structured investment vehicles owned or sponsored by the originating institution or its subsidiaries or affiliates.

Deal Sponsors

A financial institution that relies on sponsor support as a secondary source of repayment typically develops guidelines for evaluating the qualifications of financial sponsors and implements processes to regularly monitor a sponsor's financial condition. Deal sponsors may provide valuable support to borrowers such as strategic planning, management, and other tangible and intangible benefits. Sponsors may also provide sources of financial support for borrowers that fail to achieve projections. Generally, a financial institution rates a borrower based on an analysis of the borrower's standalone financial condition. However, a financial institution may consider support from a sponsor in assigning internal risk ratings when the institution can document the sponsor's history of demonstrated support as well as the economic incentive, capacity, and stated intent to continue to support the transaction. However, even with documented capacity and a history of support, the sponsor's potential contributions may not mitigate supervisory concerns absent a documented commitment of continued support. An evaluation of a sponsor's financial support typically includes the following:

- The sponsor's historical performance in supporting its investments, financially and otherwise;
- The sponsor's economic incentive to support, including the nature and amount of capital contributed at inception;
- Documentation of degree of support (for example, a guarantee, comfort letter, or verbal assurance);
- Consideration of the sponsor's contractual investment limitations;
- To the extent feasible, a periodic review of the sponsor's financial statements and trends, and an analysis of its liquidity, including the ability to fund multiple deals;
- Consideration of the sponsor's dividend and capital contribution practices;
- The likelihood of the sponsor supporting a particular borrower compared to other deals in the sponsor's portfolio; and,
- Guidelines for evaluating the qualifications of a sponsor and a process to regularly monitor the sponsor's performance.

Independent Credit Review

A financial institution with a strong and independent credit review function demonstrates the ability to identify portfolio risks and documented authority to escalate inappropriate risks and other findings to their senior management. Due to the elevated risks inherent in leveraged lending, and depending on the relative size of a financial institution's leveraged lending business, there is greater importance for the institution's credit review function to assess the performance of the leveraged portfolio more frequently and in greater depth than other segments in the loan portfolio. To be most effective, such assessments should be performed by individuals with the expertise and experience for these types of loans and the borrower's industry. Portfolio reviews should generally be conducted at least annually. For many financial institutions, the risk characteristics of leveraged portfolios, such as high reliance on enterprise value, concentrations, adverse risk rating trends, or portfolio performance, may dictate more frequent reviews.

A financial institution that staffs its internal credit review function appropriately and ensures that the function has sufficient resources is most capable of providing timely, independent, and accurate assessments of leveraged lending transactions. Effective reviews evaluate the level of risk, risk rating integrity, valuation methodologies, and the quality of risk management. Such internal credit reviews that review the institution's leveraged lending practices, policies, and procedures provide management with a complete assessment of the leveraged lending program.

Stress Testing

A financial institution typically develops and implements guidelines for conducting periodic portfolio stress tests on loans originated to hold as well as loans originated to distribute, and sensitivity analyses to quantify the potential impact of changing economic and market conditions on its asset quality, earnings, liquidity, and capital. The sophistication of stress-testing practices and sensitivity analyses are most effective when they are consistent with the size, complexity, and risk characteristics of the institution's leveraged loan portfolio. To the extent a financial institution is required to conduct enterprise-wide stress tests, the leveraged portfolio should be included in any such tests.

Conflicts of Interest

A financial institution typically develops appropriate policies and procedures to address and to prevent potential conflicts of interest when it has both equity and lending positions. For example, an institution may be reluctant to use an aggressive collection strategy with a problem borrower because of the potential impact on the value of an institution's equity interest. A financial institution may encounter pressure to provide financial or other privileged client information that could benefit an affiliated equity investor. Such conflicts also may occur when the underwriting financial institution serves as financial advisor to the seller and simultaneously offers financing to multiple buyers (that is, stapled financing). Similarly, there may be conflicting interests among the different lines of business within a financial institution or between the financial institution and its affiliates. When these situations occur, potential conflicts of interest arise between the financial institution and its customers. Effective policies and procedures clearly define potential conflicts of interest, identify appropriate risk management controls and procedures, enable employees to report potential conflicts of interest to management for action without fear of retribution, and ensure compliance with applicable laws. Further, management should have an established training program for employees on appropriate practices to follow to avoid conflicts of interest.

Oil and Gas Lending

Industry Overview

Oil and gas (O&G) lending is complex and highly specialized due to factors such as global supply and demand, geopolitical uncertainty, weather-related disruptions, fluctuations and volatility in currency markets (i.e. the strength of the U.S. dollar compared to global currency markets), and changes in environmental and other governmental policies. As such, companies and borrowers that are directly or indirectly tied to the O&G industry frequently experience expansion and contraction within key operational areas of their businesses that will directly impact their financial condition and repayment capacity.

The O&G industry has four interconnected segments:

- Upstream - exploration and production (E&P) companies
- Midstream - transporting, treating, processing, storing, and marketing to Upstream companies
- Downstream - refining and marketing
- Support/Services - equipment, services, or support activities (e.g. drilling, workover units, and water hauling services)

O&G lending to Upstream companies for E&P activities is a specialized form of lending, and is the primary focus of this section (see Reserve-Based Lending below). Loans to Midstream, Downstream and Support/Service companies are generally structured similar to other commercial loans. In addition, Midstream companies often raise capital through Master Limited Partnerships that are publicly traded. The highest credit risk is typically found in Support/Services and Upstream lending, which are more directly affected by changes in production and commodity prices.

Reserve-Based Lending

Loans for E&P activities are typically secured by proved reserves and governed by a borrowing base, an arrangement known as reserve-based lending, or RBL. Effective credit risk management in RBL requires conservative underwriting, appropriate structuring, experienced and knowledgeable lending staff, and sound loan administration practices. It is also important for the board and senior management to consider the unique risks associated with this type of lending when developing RBL policies and approving and administering such loans. These risks include, but are not limited to, credit, concentration, market volatility/pricing, limited purpose collateral, production, operational, legal, compliance/environmental, interest rate, liquidity, strategic, and third-party risk.

RBL may appear similar to traditional asset based lending (ABL), but there are notable differences. The primary source of repayment for ABL is the orderly liquidation of the collateral (receivables and inventory) into cash. Such loans are typically structured with strong controls over the collateral, such as a lock box arrangement. In contrast, the primary source of repayment for RBL is the cash flows derived from the extraction of O&G reserves. An independent, third-party reserve engineering report serves as the primary underwriting tool to estimate the future cash stream and establish a “borrowing base,” which is a collateral base agreed to by the borrower and lender that is used to limit the amount of funds the lender advances the borrower. The borrowing base is subject to periodic redeterminations, typically semiannually, that can result in the reduction of the borrowing base commitment when commodity prices and reserves are declining.

Types of Reserves

Lenders should generally only consider proved reserves, defined as having at least a 90 percent probability that the quantities actually recovered will equal or exceed the estimate, in determining collateral value. Within the proved reserves category, Proved Developed Producing (PDP), Proved Developed Non-Producing (PDNP), and Proved Undeveloped (PUD) reserves are collectively known as P1. As described below, PDNP and PUD require capital expenditures (CAPEX) to bring the non-producing and undeveloped reserves online as PDP:

- PDP represents reserves that are recoverable from existing wells with existing equipment and operating methods that are producing at the time of the engineering report estimate.
- PDNP reserves include both shut-in (PDSI) and behind the pipe (PDBP) reserves, and production can be initiated or restored with relatively low

expenditures compared to the cost of drilling a new well.

  - PDSI reserves are completion intervals that are open, but have not started producing; were shut-in for market conditions or pipeline connections; or not capable of production for mechanical reasons.
  - PDBP reserves are those expected to be recovered from existing wells that require additional completion work or future completion prior to the start of production.

- PUD reserves are expected to be recovered only after making future investment. These reserves have been proved by independent engineering reports, but do not have a well infrastructure in place.

Other categories of reserves include "probable" (P2) and "possible" (P3). Probable reserves are relatively uncertain, while possible reserves are considered speculative in nature. Probable and possible reserves should not receive any value when determining the borrowing base.

Reserve Engineering Reports

Reserve engineering reports are an estimate of the volumes of O&G reserves that are likely to be recovered based on reasonable assumptions regarding physical characteristics of the reservoir, available technology, and operating efficiencies. The significant reliance on engineering reports in underwriting RBL facilities requires sound internal controls over the collateral evaluation process. Reserve reports must be objective; based on reasonable, well-documented assumptions; and completed independently of the loan origination and collection functions. It is important for management to document the qualifications and independence of the engineer, and to periodically evaluate the production performance, which includes a comparison of production projections to actual results.

RBL collateral value consists of a point-in-time estimate of the present value (PV) of future net revenue (FNR) derived from the production and sale of existing O&G reserves, net of operating expenses, production taxes, royalties, and CAPEX, discounted at an appropriate rate. The engineering reports should contain sufficient information and documentation to support the assumptions and the analysis used to derive the forecasted cash flows and discounted PV. Bank management should provide clear guidance to the engineer at engagement regarding discount rates, pricing assumptions, operating expense escalation rates, and risk-adjustment guidelines limiting higher risk reserves. The engineer will conduct an analysis of production reports from the subject properties, and project estimated reserve depletion.

Borrowing Base

The collateral base securing each facility should be primarily comprised of PDP reserves. Inclusion of PDNP reserves in the collateral evaluation should be supported with sufficient documentation to demonstrate that the borrower has the financial capacity to convert PDNP reserves to PDP reserves by making the necessary investments to restore or initiate production within the near-term.

To include PUDs in the borrowing base calculation, the borrower should have sufficient liquidity and positive Free Cash Flow to meet operational needs, and debt service requirements, as well as be able to fund (or obtain the funding for) the CAPEX that would be required to convert these undeveloped reserves into production. Potential sale and/or marketability of the PUDs can also be considered when evaluating collateral values, provided there is adequate documentation of recent PUD sales.

Lenders use risk-adjustment factors to lower the value of unseasoned producing and non-producing reserves before applying borrowing base advance rates. Bank management should consider policy limits on production vs. non-production reserves, the oil and gas mix, maximum production coming from one well (single well concentration risk), and other risk-adjustment factors. Ideally, management achieves diversification in the geographic location of reserve fields, and establishes limits on the lowest number of producing wells needed to establish an acceptable borrowing base.

Typically, the advance rate for high-quality proved (P1) reserves should rarely exceed 65 percent (a typical range is 50 to 65 percent) of the PV of FNR. If the lender determines that PDNP or PUD reserves are to be considered in the borrowing base, these reserves should generally not exceed 25 to 35 percent of the total borrowing base. In addition, PDNP and PUD reserves should be risk-adjusted (65 to 75 percent for PDNP and 25 to 50 percent for PUD, for example) prior to applying the advance rate. Lenders may apply separate risk-adjusted advance rates for each proved reserve category in the borrowing base. During extended periods of low or declining commodity prices, it is not uncommon for banks to increase the risk adjustment for PDNP and PUD reserves.

As part of the underwriting process, lending personnel typically prepare both base-case and sensitivity-case analyses that focus on the ability of converting the underlying collateral into cash to repay the loan, including an estimate of the impact that sustained adverse changes in market conditions would have on a company's repayment ability. A base-case analysis uses standard assumption scenarios and generally includes a discount to current prices against the forward curve (projected futures pricing estimates of the commodity). A sensitivity case analysis subjects the O&G reserves to adverse external factors such as lower market prices and/or higher operating expenses to ascertain the effect on loan repayment. Full debt service capacity (DSC) should be analyzed using both the base-case and sensitivity-case scenarios.

Discount Rates

The Securities and Exchange Commission (SEC) requires publicly traded companies to report the value of their reserves using a standard discount rate of 10 percent in accordance with ASC Topic 932, Extractive Activities - Oil and Gas. In evaluating collateral valuations for RBL facilities, banks often utilize alternative discount rates. For creditworthy borrowers and during more benign operating cycles, a 9 percent discount rate is commonly used. For higher-risk borrowers or during volatile or declining market cycles for O&G, higher discount rates are typically used. If a discount rate is selected that significantly differs from generally accepted discount rates, examiners should assess management's documentation supporting its rationale. Some banks may use multiple discount rates under certain circumstances. An example may include establishing a standard discount rate for performing credits and a higher rate for higher risk facilities.

Price Decks

Prudent management regularly evaluates, and updates as necessary, its pricing assumptions for RBL, commonly referred to as the institution's price deck. The price deck is a forecast used to derive cash flow and collateral value assumptions, and typically is approved by the board of directors or a specifically designated board committee. Pricing assumptions typically represent the most significant variable in driving the final estimate of value, and must be well-supported.

Each institution's price deck typically reflects both base-case and sensitivity-case pricing scenarios. Pricing assumptions for the sensitivity case are generally sufficiently conservative and used to determine whether the borrower has the financial capacity to generate adequate cash flow to repay the debt during a prolonged low commodity price environment. Price deck considerations include, for example, current commodity pricing, forward curve projections (future price considerations), cost assumptions, discount rates, and timing of the various reports. Management should also document any risk-based adjustments applied to each proved reserve category. While the risk-adjusted base case projections will generally be used to underwrite RBLs, management should consider the ability to repay the debt using the risk-adjusted sensitivity case to determine potential exposure due to adverse market price fluctuations.

Loan Structure

RBL credit facilities are typically structured as a revolving line of credit (RLOC), a reducing revolving line of credit (RRLOC), or an amortizing term loan, governed by a well-supported and fully documented borrowing base. These credit facilities generally should fully amortize within the half-life of the reserves (that is, the time in years required to produce one-half of the total estimated recoverable production) with repayment aligning with projected cash flows. In other words, the term of the loans should be tied to the economic life of the underlying asset. This is often represented as the "reserve tail tests" that are based on the economic half-life of the reserves or the cash flow remaining after projected loan payout.

Loan durations should be fairly short-term and directly tied to the economic life of the asset (generally 50 to 60 percent of the economic life of the proved reserves or the proved reserves' half-life). The terms generally depend on the projected and actual reserve production (reserve run data), as well as the type and range of collateral (PDP, PDNP, or PUD). A reasonable portion of the estimated revenues should remain after the debt has fully amortized (reserve tail). Borrowing bases should be re-determined at least semiannually, subject to an updated reserve engineering report.

Covenants

Appropriate use of covenants is imperative in managing credit risk for O&G loans. Lenders typically require financial covenants to instill discipline in the lending relationship, including the borrower's leverage position, repayment capacity, and liquidity. In addition, covenants should limit cash distributions to owners/shareholders, and should include standard performance and financial reporting requirements. Examples of commonly used ratios/covenants for evaluating E&P companies include Free Cash Flow (FCF), Interest Coverage, Fixed Charge Coverage, Current Ratio, Quick Ratio, Senior Debt/EBITDA(X), and Total Debt/EBITDA(X). The calculation of earnings before interest, taxes, depreciation, and amortization (EBITDA) typically incorporates maintenance CAPEX (X) due to its impact on the amount of projected FCF that is available after debt service to support operations.

Hedging

When used properly, hedging may be an effective tool to help protect the borrower and the lender from sharp commodity price declines by providing a stable cash flow stream. E&P companies frequently use hedging instruments such as futures contracts, swaps, collars, and put options to reduce price risk exposure. Generally, hedges should be limited to no more than 85 percent of projected production volumes. Counterparties should be limited to reputable, financially sound companies that are approved in accordance with the institution's O&G loan policy. If the hedges are taken as collateral or part of the borrowing base, the advance rate and any limitations on the hedging position should be documented in the loan agreement. If hedges are sold or monetized, the proceeds of such should generally be applied to the respective debt.

Borrower and Financial Analysis

Management should have a clear understanding of the overall financial health of the borrower that includes an assessment of the borrower's ability to maintain operations through adverse market conditions. E&P companies in sound financial condition should have strong cash flow from reliable revenue sources and well-controlled operating expenses. Companies should also have adequate sources of liquidity and effective working capital management, sound reserve development practices, well-defined criteria for divestiture, adequate capital structure, manageable levels of debt, and appropriate financial reporting. As part of the overall financial analysis of the relationship, updated engineering data should be well-documented and should enable the lender to determine the borrower's capacity to service the debt. Any over-advance situation should have a reasonable plan and timeframe to cure the over-advance.

The principals of successful E&P companies should be experienced and have a well-documented track record of managing through all stages of the business cycle. In good times, company management should be able to identify, acquire, and develop reserves profitably and in line with expectations. During declining price cycles, company management should be able to demonstrate the ability to streamline operations, maintain reasonable production, manage working capital, strategically reduce CAPEX, and make sound divestitures to ensure repayment of debt. Bank management should evaluate the borrower's cost cycle, which reflects not only the ability to generate cash flow from production, but also the CAPEX necessary to replace depleted reserves. Working capital management is critically important, as delinquent payments to vendors can result in a negative working capital position (due to accounts payable increasing) and an increased leverage ratio.

Financial analysis typically includes the following:

- Adequacy of operating cash flows to service existing total debt;
- Overall compliance with financial covenants, including borrowing base limitations as detailed in the loan agreement;
- Reasonableness of the company's budget assumptions and projections;
- Comparison of borrower provided production projections with actual results;
- Working capital, tangible net worth, and leverage positions; and
- Impact of capital expenses and recent acquisitions.

O&G Loan Policy Guidelines

The O&G loan policy should provide sufficient guidance to loan officers, clearly convey appropriate policy limitations and monitoring procedures, and detail appropriate underwriting standards and practices. The O&G policy should clearly indicate those industry segments (Upstream, Midstream, Downstream, and Support/Services) the board chooses to lend to and include guidance on each of those segments.

For institutions engaged in RBL, appropriate policies address reserve measurement and valuation analysis, borrowing base determinations, production history analysis, financial statement and ratio analysis, commitment advances, discount rates, price deck formulation, financial covenants, steps to cure an over-advance situation, and ALLL considerations. Specific guidelines typically cover the following areas:

- Lending objectives, risk appetite, portfolio limits, target market, and concentration limits;
- Methodology and requirements for monitoring O&G markets, including pricing, supply and demand trends, overall market trends, and industry analysis;
- Board and committee oversight over the O&G lending and engineering departments;
- Officer and committee lending limits;
- Borrowing base calculations and risk-adjustments;
- Price deck considerations and adjustments;
- Advance rates, risk-adjusted values for PDP, PDNP, and PUD reserves, and requirement to risk adjust the discount value of nonproducing reserves before applying advance rates;
- Frequency and required details of borrowing base redeterminations and price deck revaluations;
- Requirements for independent engineering reports and analysis thereof;
- Well concentration guidelines and maximum per single well limits;

- Financial covenants, minimum ratio and other financial information requirements, and review requirements (e.g. current ratio, fixed charge coverage, cash flow coverage, leverage ratios);
- Collateral valuation requirements, including required remaining collateral at payout;
- Renewal and restructuring guidelines, including nonaccrual and troubled debt restructuring implications;
- Remedies for declining collateral or over-advanced situations, such as Monthly Commitment Reductions, pledge of additional reserves as collateral, and sale of non-productive reserves;
- Minimum required insurance (including property, liability, and environmental);
- Defined loan safety or coverage factors and/or loan value policies, including other debt that is "pari-passu" (i.e. all debts sharing equally in the production cash flows available to amortize debt);
- Typical amortization, payout, and loan repayment terms, including maximum terms for production revolvers and term loans;
- Guarantor requirements;
- Hedging requirements, policies, and limitations;
- Stress-testing and sensitivity analysis and requirements thereof; and
- Monitoring requirements for the risks inherent in loans dependent on royalty interests in production revenues for repayment.

Credit Risk Rating Assessment and Classification Guidelines

An appropriate O&G loan policy also addresses specific credit risk review procedures for the O&G portfolio and O&G loan grading criteria. Risk rating definitions should be clearly defined. RBL that are adequately protected by the current sound worth and debt service capacity of the borrower, guarantor, or underlying collateral generally will not be adversely classified for supervisory purposes. However, if any of the following circumstances are present, a more in-depth and comprehensive analysis of the credit is needed to determine whether the loan has potential or well-defined weaknesses:

- The loan balance exceeds 65 percent of the PV of FNR of PDP, or the cash flow analysis indicates that the loan will not amortize within the reserve half-life;
- The credit is not performing in accordance with contractual terms (repayment of interest and principal);
- Advance rates exceed the institution's limits or industry standards for proved reserves;
- Frequent over-advances occur at subsequent borrowing base redeterminations;
- Excessive operating leverage;
- Covenant defaults;
- Delinquent payables, or other evidence of poor working capital management;
- Significant current or likely future disruptions in production;
- Frequent financial statement revisions or changes in chosen accounting method;
- Maintenance or capital expenditures significantly exceed budgeted forecasts; or
- The credit is identified by the institution as a "distressed" credit.

Examiners are to consider all information relevant to evaluating the prospects that the loan will be repaid, including the borrower's creditworthiness, the cash flow provided by the borrower's operation, the collateral supporting the loan, integrity and reliability of the engineering data, borrowing base considerations, primary source of repayment, and any support provided by financially responsible guarantors and co-borrowers. If the borrower's circumstances reveal well-defined weaknesses, adverse classification of the loan relationship is likely warranted. The level and severity of classification of distressed, collateral-dependent RBLs will depend on the quality of the underlying collateral, based on the most recent re-determined and risk-adjusted borrowing base that is contractually obligated to be funded.

The portion of the loan commitment(s) secured by the NPV of total risk-adjusted proved reserves should be classified Substandard. When the potential for loss may be mitigated by the outcome of certain pending events, or when loss is expected but the amount of the loss cannot be reasonably determined, the remaining balance secured by the NPV of total unrisked proved reserves should be classified Doubtful. The portion of the loan commitment(s) that exceeds 100 percent of the NPV of total unrisked proved reserves, and is uncollectible, should be classified Loss. These guidelines may be adjusted depending on the borrower's specific situation and should not replace examiner judgment.

The following tables illustrate an example of the rating methodology for a classified borrower. Actual pricing, discount rates, and risk adjustment factors applied by the institution may vary according to current market conditions and the nature of the reserves. Examiners should closely review the key assumptions made by the institution in arriving at the current collateral valuation.

Example: Collateral Valuation ($ Million)
Discounted NPV at 9% and using NYMEX Strip Pricing

Valuation Basis	Hedges	PDP	PDNP	PUD	Total Proved
Unrisked NPV	$10	$50	$20	$40	$120
Risk adjustment factors	100%	100%	75%	50%	
Risked & Adjusted NPV	$10	$50	$15	$20	$95
		Total collateral value:			$95

Example: Classification ($ Million)
Borrowing base commitment on RBL is $125 million

	TC	Pass	SM	II	III	IV
RBL	$125			$95	$25	$5
Total	$125			$95	$25	$5

TC: Total Commitment SM: Special Mention
II: Substandard III: Doubtful IV: Loss

Note: The $25 million of Doubtful represents the difference between the unrisked NPV and the risked NPV. If the borrower's prospects for further developing PDNP and PUD reserves to producing status are unlikely or not supported by a pending event, this amount should be reflected as Loss.

Institutions should follow accounting principles when determining whether a loan should be placed on nonaccrual. Each extension should be independently evaluated to determine whether it should be on nonaccrual; that is, nonaccrual status should not be automatically applied to multiple loans or extensions of credit to a single borrower if only one loan meets the criteria for nonaccrual status. However, multiple loans to one borrower that are structured as pari-passu to principal and interest and supported by the same repayment source should not be treated differently for nonaccrual or troubled debt restructuring purposes, regardless of collateral lien position.

Real Estate Loans

General

Real estate loans are part of the loan portfolios of almost all commercial banks. Real estate loans include credits advanced for the purchase of real property. However, the term may also encompass extensions granted for other purposes, but for which primary collateral protection is real property.

The degree of risk in a real estate loan depends primarily on the loan amount in relation to collateral value, the interest rate, and most importantly, the borrower's ability to repay in an orderly fashion. It is extremely important that an institution's real estate loan policy ensure that loans are granted with the reasonable probability the debtor will be able and willing to meet the payment terms. Placing undue reliance upon a property's appraised value in lieu of an adequate initial assessment of a debtor's repayment ability is a potentially dangerous mistake.

Historically, many banks have jeopardized their capital structure by granting ill-considered real estate mortgage loans. Apart from unusual, localized, adverse economic conditions which could not have been foreseen, resulting in a temporary or permanent decline in realty values, the principal errors made in granting real estate loans include inadequate regard to normal or even depressed realty values during periods when it is in great demand thus inflating the price structure, mortgage loan amortization, the maximum debt load and repayment capacity of the borrower, and failure to reasonably restrict mortgage loans on properties for which there is limited demand.

A principal indication of a troublesome real estate loan is an improper relationship between the amount of the loan, the potential sale price of the property, and the availability of a market. The potential sale price of a property may or may not be the same as its appraised value. The current potential sale price or liquidating value of the property is of primary importance and the appraised value is of secondary importance. There may be little or no current demand for the property at its appraised value and it may have to be disposed of at a sacrifice value.

Examiners must appraise not only individual mortgage loans, but also the overall mortgage lending and administration policies to ascertain the soundness of its mortgage loan operations as well as the liquidity contained in the account. Institutions generally establish policies that address the following factors: the maximum amount that may be loaned on a given property, in a given category, and on all real estate loans; the need for appraisals (professional judgments of the present and/or future value of the real property) and for amortization on certain loans.

Real Estate Lending Standards

Section 18(o) of the FDI Act requires the Federal banking agencies to adopt uniform regulations prescribing standards for loans secured by liens on real estate or made for the purpose of financing permanent improvements to real estate. For FDIC-supervised institutions, Part 365 of the FDIC Rules and Regulations requires each institution to adopt and maintain written real estate lending policies that are consistent with sound lending principles, appropriate for the size of the institution and the nature and scope of its operations. Within these general parameters, the regulation specifically requires an institution to establish policies that include:

- Portfolio diversification standards;
- Prudent underwriting standards including loan-to-value limits;
- Loan administration procedures;
- Documentation, approval and reporting requirements; and
- Procedures for monitoring real estate markets within the institution's lending area.

These policies also should consider the Interagency Guidelines for Real Estate Lending Policies and must be reviewed and approved annually by the institution's board of directors.

The interagency guidelines, which are an appendix to Part 365, are intended to help institutions satisfy the regulatory requirements by outlining the general factors to consider when developing real estate lending standards. The guidelines suggest maximum supervisory loan-to-value (LTV) limits for various categories of real estate loans and explain how the agencies will monitor their use.

Institutions are expected to establish their own internal LTV limits consistent with their needs. These internal limits should not exceed the following recommended supervisory limits:

- 65 percent for raw land;
- 75 percent for land development;
- 80 percent for commercial, multi-family, and other non-residential construction;
- 85 percent for construction of a 1-to-4 family residence;
- 85 percent for improved property; and
- Owner-occupied 1-to-4 family home loans have no suggested supervisory LTV limits. However, for any such loan with an LTV ratio that equals or exceeds 90 percent at origination, an institution should require appropriate credit enhancement in the form of either mortgage insurance or readily marketable collateral.

Certain real estate loans are exempt from the supervisory LTV limits because of other factors that significantly reduce risk. These include loans guaranteed or insured by the Federal, State or local government as well as loans to be sold promptly in the secondary market without recourse. A complete list of excluded transactions is included in the guidelines.

Because there are a number of credit factors besides LTV limits that influence credit quality, loans that meet the supervisory LTV limits should not automatically be considered sound, nor should loans that exceed the supervisory LTV limits automatically be considered high risk. However, loans that exceed the supervisory LTV limit should be identified in the institution's records and the aggregate amount of these loans reported to the institution's board of directors at least quarterly. The guidelines further State that the aggregate amount of loans in excess of the supervisory LTV limits should not exceed the institution's total capital. Moreover, within that aggregate limit, the total loans for all commercial, agricultural and multi-family residential properties (excluding 1-to-4 family home loans) should not exceed 30 percent of total capital.

Institutions should develop policies that are clear, concise, consistent with sound real estate lending practices, and meet their needs. Policies should not be so complex that they place excessive paperwork burden on the institution. Therefore, when evaluating compliance with Part 365, examiners should carefully consider the following:

- The size and financial condition of the institution;
- The nature and scope of the institution's real estate lending activities;
- The quality of management and internal controls;
- The size and expertise of the lending and administrative staff; and
- Market conditions.

It is important to distinguish between the regulation and the interagency guidelines. While the guidelines are included as an appendix to the regulation, they are not part of the regulation. Therefore, when an apparent violation of Part 365 is identified, it should be listed in the Report of Examination in the same manner as other apparent violations. Conversely, when an examiner determines that an institution is not in conformance with the guidelines and the deficiency is a safety and soundness concern, an appropriate comment should be included in the examination report; however, the deficiency would not be a violation of the regulation.

Examination procedures for various real estate loan categories are included in the ED Modules.

Commercial Real Estate Loans

These loans comprise a major portion of many banks' loan portfolios. When problems exist in the real estate markets that the institution is servicing, it is necessary for examiners to devote additional time to the review and evaluation of loans in these markets.

There are several warning signs that real estate markets or projects are experiencing problems that may result in real estate values decreasing from original appraisals or projections. Adverse economic developments and/or an overbuilt market can cause real estate projects and loans to become troubled. Signs of troubled real estate markets or projects include, but are not limited to:

- Rent concessions or sales discounts resulting in cash flow below the level projected in the original appraisal.
- Changes in concept or plan: for example, a condominium project converting to an apartment project.
- Construction delays resulting in cost overruns which may require renegotiation of loan terms.
- Slow leasing or lack of sustained sales activity and/or increasing cancellations which may result in protracted repayment or default.
- Lack of any sound feasibility study or analysis.
- Periodic construction draws which exceed the amount needed to cover construction costs and related overhead expenses.
- Identified problem credits, past due and non-accrual loans.

Real Estate Construction Loans

A construction loan is used to construct a particular project within a specified period of time and should be controlled by supervised disbursement of a predetermined sum of money. It is generally secured by a first mortgage or deed of trust and backed by a purchase or takeout agreement from a financially responsible permanent lender. Construction loans are vulnerable to a wide variety of risks. The major risk arises from the necessity to complete projects within specified cost and time limits. The risk inherent in construction lending can be limited by establishing policies which specify type and extent of institution involvement. Such policies generally define procedures for controlling disbursements and collateral margins and assuring timely completion of the projects and repayment of the institution's loans.

Before entering a construction loan agreement, it is appropriate for the institution to investigate the character, expertise, and financial standing of all related parties. Documentation files would then include background information concerning reputation, work and credit experience, and financial statements. Such documentation indicates that the developer, contractor, and subcontractors have demonstrated the capacity to successfully complete the type of project to be undertaken. The appraisal techniques used to value a proposed construction project are essentially the same as those used for other types of real estate. The institution should realize that appraised collateral values are not usually met until funds are advanced and improvements made.

The institution, the builder, and the property owner typically join in a written building loan agreement that specifies the performance of each party during the entire course of construction. Loan funds are generally disbursed based upon either a standard payment plan or a progress payment plan. The standard payment plan is normally used for residential and smaller commercial construction loans and utilizes a pre-established schedule for fixed payments at the end of each specified stage of construction. The progress payment plan is normally used for larger, more complex, building projects. The plan is generally based upon monthly disbursements totaling 90 percent of the value with 10 percent held back until the project is completed.

Although many credits advanced for real estate acquisition, development or construction are properly considered loans secured by real estate, other such credits are, in economic substance, "investments in real estate ventures". A key feature of these transactions is that the institution as lender plans to share in the expected residual profit from the ultimate sale or other use of the development. These profit sharing arrangements may take the form of equity kickers, unusually high interest rates, a percentage of the gross rents or net cash flow generated by the project, or some other form of profit participation over and above a reasonable amount for interest and related loan fees. These extensions of credit may also include such other characteristics as nonrecourse debt, 100 percent financing of the development cost (including origination fees, interest payments, construction costs, and even profit draws by the developer), and lack of any substantive financial support from the borrower or other guarantors. Acquisition, Development, and Construction (ADC) arrangements that are in substance real estate investments of the institution should be reported accordingly.

The following are the basic types of construction lending:

- <u>Unsecured Front Money</u> **-** Unsecured front money loans are working capital advances to a borrower who may be engaged in a new and unproven venture. Many bankers believe that unsecured front money lending is not prudent unless the institution is involved in the latter stages of construction financing. A builder planning to start a project before construction funding is obtained often uses front money loans. The funds may be used to acquire or develop a building site, eliminate title impediments, pay architect or standby fees, and/or meet minimum working capital requirements established by construction lenders. Repayment often comes from the first draw against construction financing. Unsecured front money loans used for a developer's equity investment in a project or to cover initial costs overruns are symptomatic of an undercapitalized, inexperienced or inept builder.

- Land Development Loans **-** Land development loans are generally secured purchase or development loans or unsecured advances to investors and speculators. Secured purchase or development loans are usually a form of financing involving the purchase of land and lot development in anticipation of further construction or sale of the property. A land development loan should be predicated upon a proper title search and/or mortgage insurance. The loan amount should be based on appraisals on an "as is" and "as completed" basis. Projections should be accompanied by a study explaining the effect of property improvements on the market value of the land. There should be a sufficient spread between the amount of the development loan and the estimated market value to allow for unforeseen expenses. Appropriate repayment programs typically are structured to follow the sales or development program. In the case of an unsecured land development loan to investors or speculators, it is prudent for institution management to analyze the borrower's financial statements for sources of repayment other than the expected return on the property development.

- Commercial Construction Loans **-** Loans financing commercial construction projects are usually collateralized, and such collateral is generally identical to that for commercial real estate loans. Supporting documentation should include a recorded mortgage or deed of trust, title insurance policy and/or title opinions, appropriate liability insurance and other coverages, land appraisals, and evidence that taxes have been paid to date. Additional documents relating to commercial construction loans include loan agreements, takeout commitments, tri-party (buy/sell) agreements, completion or corporate bonds, and inspection or progress reports.

- Residential Construction Loans **-** Residential construction loans may be made on a speculative basis or as prearranged permanent financing. Smaller banks often engage in this type of financing and the aggregate total of individual construction loans may equal a significant portion of their capital funds. Prudence dictates that permanent financing be assured in advance because the cost of such financing can have a substantial effect on sales. Proposals to finance speculative housing should be evaluated in accordance with predetermined policy standards compatible with the institution's size, technical competence of its management, and housing needs of its service area.

  The prospective borrower's reputation, experience, and financial condition should be reviewed. The finished project's realistic marketability in favorable and unfavorable market conditions is also an important consideration.

  In addition to normal safeguards such as a recorded first mortgage, acceptable appraisal, construction agreement, draws based on progress payment plans and inspection reports, an institution dealing with speculative contractors should institute control procedures tailored to the individual circumstances. A predetermined limit on the number of unsold units to be financed at any one time is typically included in the loan agreement to avoid overextending the contractor's capacity. Loans on larger residential construction projects are usually negotiated with prearranged permanent financing. Documentation of tract loans frequently includes a master note allocated for the entire project and a master deed of trust or mortgage covering all land involved in the project. Payment of the loan will depend largely upon the sale of the finished homes. As each sale is completed, the institution makes a partial release of the property covered by its master collateral document. In addition to making periodic inspections during the course of construction, periodic progress reports (summary of inventory lists maintained for each tract project) typically are made on the entire project. A comprehensive inventory list shows each lot number, type of structure, release price, sales price, and loan balance.

The exposure in any type of construction lending is that the full value of the collateral does not exist at the time the loan is granted. Therefore, it is important for management to ensure funds are used properly to complete construction or development of the property serving as collateral. If default occurs, the institution must be in a position to either complete the project or to salvage its construction advances. The various mechanic's and materialmen's liens, tax liens, and other judgments that arise in such cases are distressing to even the most seasoned lender. Every precaution should be taken by the lender to minimize any outside attack on the collateral. The construction lender may not be in the preferred position indicated by documents in the file. Laws of some states favor the subcontractors (materialmen's liens, etc.), although those of other states protect the construction lender to the point of first default, provided certain legal requirements have been met. Depending on the type and size of project being funded, construction lending can be a complex and fairly high-risk venture. For this reason, institution management should ensure that it has enacted policies and retained sufficiently trained personnel before engaging in this type of lending.

Home Equity Loans

A home equity loan is a loan secured by the equity in a borrower's residence. It is generally structured in one of two ways. First, it can be structured as a traditional second mortgage loan, wherein the borrower obtains the funds for the full amount of the loan immediately and repays the debt with a fixed repayment schedule. Second, the home equity borrowing can be structured as a line of credit, with a check, credit card, or other access to the line over its life.

The home equity line of credit has evolved into the dominant form of home equity lending. This credit instrument generally offers variable interest rates and flexible repayment terms. Additional characteristics of this product line include relatively low interest rates as compared to other forms of consumer credit, absorption by some banks of certain fees (origination, title search, appraisal, recordation cost, etc.) associated with establishing a real estate-related loan. The changes imposed by the Tax Reform Act of 1986 relating to the income tax deductibility of interest paid on consumer debt led to the increased popularity of home equity lines of credit.

Home equity lending is widely considered to be a low-risk lending activity. These loans are secured by housing assets, the value of which historically has performed well. Nevertheless, the possibility exists that local housing values or household purchasing power may decline, stimulating abandonment of the property and default on the debt secured by the housing. Certain features of home equity loans make them particularly susceptible to such risks. First, while the variable rate feature of the debt reduces the interest rate risk of the lender, the variable payment size exposes the borrower to greater cash flow risks than would a fixed-rate loan, everything else being equal. This, in turn, exposes the lender to greater credit risk. Another risk is introduced by the very nature of the home equity loan. Such loans are generally secured by a junior lien. Thus, there is less effective equity protection than in a first lien instrument. Consequently, a decline in the value of the underlying housing results in a much greater than proportional decline in the coverage of a home equity loan. This added leverage makes them correspondingly riskier than first mortgages.

Institutions that make these kinds of loans typically adopt specific policies and procedures for dealing with this product line. Management expertise in mortgage lending and open-end credit procedures is critical to the appropriate administration of the portfolio. Another major concern is that borrowers will become overextended and the institution will have to initiate foreclosure proceedings. Therefore, underwriting standards should emphasize the borrower's ability to service the line from cash flow rather than the sale of the collateral, especially if the home equity line is written on a variable rate basis. If the institution has offered a low introductory interest rate, repayment capacity should be analyzed at the rate that could be in effect at the conclusion of the initial term.

Other important considerations include acceptable loan-to-value and debt-to-income ratios, and proper credit and collateral documentation, including adequate appraisals and written evidence of prior lien status. Another significant risk concerns the continued lien priority for subsequent advances under a home equity line of credit. State law governs the status of these subsequent advances. It is also important that the institution's program include periodic reviews of the borrower's financial condition and continuing ability to repay the indebtedness.

The variation in contract characteristics of home equity debt affects the liquidity of this form of lending. For debt to be easily pooled and sold in the secondary market, it needs to be fairly consistent in its credit and interest rate characteristics. The complexity of the collateral structures, coupled with the uncertain maturity of revolving credit, makes home equity loans considerably less liquid than straight first lien, fixed maturity mortgage loans.

While home equity lending is considered to be fairly low-risk, subprime home equity loans and lending programs exist at some banks. These programs have a higher level of risk than traditional home equity lending programs. Individual or pooled home equity loans that have subprime characteristics should be analyzed using the information provided in the subprime section of this Manual.

Agricultural Loans

Introduction

Agricultural loans are an important component of many community institution loan portfolios. Agricultural banks represent a material segment of commercial banks and constitute an important portion of the group of banks over which the FDIC has the primary Federal supervisory responsibility.

Agricultural loans are used to fund the production of crops, fruits, vegetables, and livestock, or to fund the purchase or refinance of capital assets such as farmland, machinery and equipment, breeder livestock, and farm real estate improvements (for example, facilities for the storage, housing, and handling of grain or livestock). The production of crops and livestock is especially vulnerable to two risk factors that are largely outside the control of individual lenders and borrowers: commodity prices and weather conditions. While examiners must be alert to, and critical of, operational and managerial weaknesses in agricultural lending activities, they must also recognize when the institution is taking reasonable steps to deal with these external risk factors. Accordingly, loan restructurings or extended repayment terms, or other constructive steps to deal with financial difficulties faced by agricultural borrowers because of adverse weather or commodity conditions, will not be criticized if done in a prudent manner and with proper risk controls and management oversight. Examiners should recognize these constructive steps and fairly portray them in oral and written communications regarding examination findings. This does not imply, however, that analytical or classification standards should be compromised. Rather, it means that the institution's response to these challenges will be considered in supervisory decisions.

Agricultural Loan Types and Maturities

Production or Operating Loans **-** Short-term (one year or less) credits to finance seed, fuel, chemicals, land and machinery rent, labor, and other costs associated with the production of crops. Family living expenses are also sometimes funded, at least in part, with these loans. The primary repayment source is sale of the crops at the end of the production season when the harvest is completed.

Feeder Livestock Loans **-** Short-term loans for the purchase of, or production expenses associated with, cattle, hogs, sheep, poultry or other livestock. When the animals attain market weight and are sold for slaughter, the proceeds are used to repay the debt.

Breeder Stock Loans **-** Intermediate-term credits (generally three to five years) used to fund the acquisition of breeding stock such as beef cows, sows, sheep, dairy cows, and poultry. The primary repayment source is the proceeds from the sale of the offspring of these stock animals, or their milk or egg production.

Machinery and Equipment Loans **-** Intermediate-term loans for the purchase of a wide array of equipment used in the production and handling of crops and livestock. Cash flow from farm earnings is the primary repayment source. Loans for grain handling and storage facilities are also sometimes included in this category, especially if the facilities are not permanently affixed to real estate.

Farm Real Estate Acquisition Loans **-** Long-term credits for the purchase of farm real estate, with cash flow from earnings representing the primary repayment source. Significant, permanent improvements to the real estate, such as for livestock housing or grain storage, may also be included within this group.

Carryover Loans **-** This term is used to describe two types of agricultural credit. The first is production or feeder livestock loans that are unable to be paid at their initial, short-term maturity, and which are rescheduled into an intermediate or long-term amortization. This situation arises when weather conditions cause lower crop yields, commodity prices are lower than anticipated, production costs are higher than expected, or other factors result in a shortfall in available funds for debt repayment. The second type of carryover loan refers to already-existing term debt whose repayment terms or maturities need to be rescheduled because of inadequate cash flow to meet existing repayment requirements. This need for restructuring can arise from the same factors that lead to carryover production or feeder livestock loans. Carryover loans are generally restructured on an intermediate or long-term amortization, depending upon the type of collateral provided, the borrower's debt service capacity from ongoing operations, the debtor's overall financial condition and trends, or other variables. The restructuring may also be accompanied by acquisition of Federal guarantees through the farm credit system to lessen risk to the institution.

Agricultural Loan Underwriting Guidelines

Many underwriting standards applicable to commercial loans also apply to agricultural credits. The discussion of those shared standards is therefore not repeated. Some items, however, are especially pertinent to agricultural credit and therefore warrant emphasis.

Financial and Other Credit Information **-** As with any type of lending, sufficient information must be available so that the institution can make informed credit decisions. Basic information includes balance sheets, income statements, cash flow projections, loan officer file comments, and collateral inspections, verifications, and valuations. Generally, financial information should be updated not less than annually (loan officer files should be updated as needed and document all significant meetings and events). Credit information should be analyzed by management so that appropriate and timely actions are taken, as necessary, to administer the credit.

Institutions should be given some reasonable flexibility as to the level of sophistication or comprehensiveness of the aforementioned financial information, and the frequency with which it is obtained, depending upon such factors as the credit size, the type of loans involved, the financial strength and trends of the borrower, and the economic, climatic or other external conditions which may affect loan repayment. It may therefore be inappropriate for the examiner to insist that all agricultural borrowers be supported with the full complement of balance sheets, income statements, and other data discussed above, regardless of the nature and amount of the credit or the debtor's financial strength and payment record.

Nonetheless, while recognizing some leeway is appropriate, most of the institution's agricultural credit lines, and all of its larger or more significant ones, should be sufficiently supported by the financial information mentioned.

Cash Flow Analysis - History clearly demonstrated that significant problems can develop when banks fail to pay sufficient attention to cash flow adequacy in underwriting agricultural loans. While collateral coverage is important, the primary repayment source for intermediate and long-term agricultural loans is not collateral but cash flow from ordinary operations. This principle should be evident in the institution's agricultural lending policies and implemented in its actual practices. Cash flow analysis is therefore an important aspect of the examiner's review of agricultural loans. Assumptions in cash flow projections should be reasonable and consider not only current conditions but also the historical performance of the farming operation.

Collateral Support - Whether a loan or line of credit warrants unsecured versus secured status in order to be prudent and sound is a matter the examiner has to determine based on the facts of the specific case. The decision should generally consider such elements as the borrower's overall financial strength and trends, profitability, financial leverage, degree of liquidity in asset holdings, managerial and financial expertise, and amount and type of credit. Nonetheless, as a general rule, intermediate and long-term agricultural credit is typically secured, and many times production and feeder livestock advances will also be collateralized. Often the security takes the form of an all-inclusive lien on farm personal property, such as growing crops, machinery and equipment, livestock, and harvested grain. A lien on real estate is customarily taken if the loan was granted for the purchase of the property, or if the borrower's debts are being restructured because of debt servicing problems. In some cases, the institution may perfect a lien on real estate as an abundance of caution.

Examiner review of agricultural related collateral valuations varies depending on the type of security involved. Real estate collateral should be reviewed using normal procedures. Feeder livestock and grain are highly liquid commodities that are bought and sold daily in active, well-established markets. Their prices are widely reported in the daily media; so, obtaining their market values is generally easy. The market for breeder livestock may be somewhat less liquid than feeder livestock or grain, but values are nonetheless reasonably well known and reported through local or regional media or auction houses. If such information on breeding livestock is unavailable or is considered unreliable, slaughter prices may be used as an alternative (these slaughter prices comprise "liquidation" rather than "going concern" values). The extent of use and level of maintenance received significantly affect machinery and equipment values. Determining collateral values can therefore be very difficult as maintenance and usage levels vary significantly. Nonetheless, values for certain pre-owned machinery and equipment, especially tractors, combines, and other harvesting or crop tillage equipment, are published in specialized guides and are based on prices paid at farm equipment dealerships or auctions. These used machinery guides may be used as a reasonableness check on the valuations presented on financial statements or in management's internal collateral analyses.

Prudent agricultural loan underwriting also includes systems and procedures to ensure that the institution has a valid note receivable from the borrower and an enforceable security interest in the collateral, should judicial collection measures be necessary. Among other things, such systems and procedures will confirm that promissory notes, loan agreements, collateral assignments, and lien perfection documents are signed by the appropriate parties and are filed, as needed, with the appropriate State, county, and/or municipal authorities. Flaws in the legal enforceability of loan instruments or collateral documents will generally be unable to be corrected if they are discovered only when the credit is distressed and the borrower relationship strained.

Structuring - Orderly liquidation of agricultural debt, based on an appropriate repayment schedule and a clear understanding by the borrower of repayment expectations, helps prevent collection problems from developing. Amortization periods for term indebtedness should correlate with the useful economic life of the underlying collateral and with the operation's debt service capacity. A too-lengthy amortization period can leave the institution under secured in the latter part of the life of the loan, when the borrower's financial circumstances may have changed. A too-rapid amortization, on the other hand, can impose an undue burden on the cash flow capacity of the farming operation and thus lead to loan default or disruption of other legitimate financing needs of the enterprise. It is also generally preferable that separate loans or lines of credit be established for each loan purpose category financed by the institution.

Administration of Agricultural Loans

Two aspects of prudent loan administration deserve emphasis: collateral control and renewal practices for production loans.

Collateral Control - Production and feeder livestock loans are sometimes referred to as self liquidating because sale of the crops after harvest, and of the livestock when they reach maturity, provides a ready repayment source for these credits. These self-liquidating benefits may be lost, however, if the institution does not monitor and exercise sufficient control over the disposition of the proceeds from the sale. In agricultural lending, collateral control is mainly accomplished by periodic on-site inspections and verifications of the security pledged, with the results of those inspections documented, and by implementing procedures to ensure sales proceeds are applied to the associated debt before those proceeds are released for other purposes. The recommended frequency of collateral inspections varies depending upon such things as the nature of the farming operation, the overall credit soundness, and the turnover rate of grain and livestock inventories.

Renewal of Production Loans **-** After completion of the harvest, some farm borrowers may wish to defer repayment of some or all of that season's production loans, in anticipation of higher market prices at a later point (typically, crop prices are lower at harvest time when the supply is greater). Such delayed crop marketing will generally require production loan extensions or renewals. In these situations, the institution must strike an appropriate balance of, on the one hand, not interfering with the debtor's legitimate managerial decisions and marketing plans while, at the same time, taking prudent steps to ensure its production loans are adequately protected and repaid on an appropriate basis. Examiners should generally not take exception to reasonable renewals or extensions of production loans when the following factors are favorably resolved:

- The borrower has sufficient financial strength to absorb market price fluctuations. Leverage and liquidity in the balance sheet, financial statement trends, profitability of the operation, and past repayment performance are relevant indices.
- The borrower has sufficient financial capacity to support both old and new production loans. That is, in a few months subsequent to harvest, the farmer will typically be incurring additional production debt for the upcoming crop season.
- The institution has adequately satisfied itself of the amount and condition of grain in inventory, so that the renewed or extended production loans are adequately supported. Generally, this means that a current inspection report will be available.

Classification Guidelines for Agricultural Credit

When determining the level of risk in a specific lending relationship, the relevant factual circumstances must be reviewed in total. This means, among other things, that when an agricultural loan's primary repayment source is jeopardized or unavailable, adverse classification is **not** automatic. Rather, such factors as the borrower's historical performance and financial strength, overall financial condition and trends, the value of any collateral, and other sources of repayment must be considered. In considering whether a given agricultural loan or line of credit should be adversely classified, collateral margin is an important, though not necessarily the determinative, factor. If that margin is so overwhelming as to remove all reasonable prospect of the institution sustaining some loss, it is generally inappropriate to adversely classify such a loan. Note, however, that if there is reasonable uncertainty as to the value of that security, because of an illiquid market or other reasons, that uncertainty can, when taken in conjunction with other weaknesses, justify an adverse classification of the credit, or, at minimum, may mean that the margin in the collateral needs to be greater to offset this uncertainty. Moreover, when assessing the adequacy of the collateral margin, it must be remembered that deteriorating financial trends will, if not arrested, typically result in a shrinking of that margin. Such deterioration can also reduce the amount of cash available for debt service needs.

That portion of an agricultural loan(s) or line of credit, which is secured by grain, feeder livestock, and/or breeder livestock, will generally be withheld from adverse classification. The basis for this approach is that grain and livestock are highly marketable and provide good protection from credit loss. However, that high marketability also poses potential risks that must be recognized and controlled. The following conditions must therefore be met in order for this provision to apply:

- The institution must take reasonable steps to verify the existence and value of the grain and livestock. This generally means that on-site inspections must be made and documented. Although the circumstances of each case must be taken into account, the general policy is that, for the classification exclusion to apply, inspections should have been performed not more than 90 days prior to the examination start date for feeder livestock and grain collateral, and not more than six months prior to the examination start date for breeder stock collateral. Copies of invoices or bills of sale are acceptable substitutes for inspection reports prepared by institution management, in the case of loans for the purchase of livestock.
- Loans secured by grain warehouse receipts are generally excluded from adverse classification, up to the market value of the grain represented by the receipts.
- The amount of credit to be given for the livestock or grain collateral should be based on the daily, published, market value as of the examination start date, less marketing and transportation costs, feed and veterinary expenses (to the extent determinable), and, if material in amount, the accrued interest associated

with the loan(s). Current market values for breeder stock may be derived from local or regional newspapers, area auction barns, or other sources considered reliable. If such valuations for breeding livestock cannot be obtained, the animals' slaughter values may be used.

- The institution must have satisfactory practices for controlling sales proceeds when the borrower sells livestock and feed and grain.
- The institution must have a properly perfected and enforceable security interest in the assets in question.

Examiners should exercise great caution in granting the grain and livestock exclusion from adverse classification in those instances where the borrower is highly leveraged, or where the debtor's basic operational viability is seriously in question, or if the institution is in an under-secured position. The issue of control over proceeds becomes extremely critical in such highly distressed credit situations. If the livestock and grain exclusion from adverse classification is not given in a particular case, institution management should be informed of the reasons why.

With the above principles, requirements, and standards in mind, the general guidelines for determining adverse classification for agricultural loans are as follows, listed by loan type.

<u>Feeder Livestock Loans</u> **-** The self-liquidating nature of these credits means that they are generally not subject to adverse classification. However, declines in livestock prices, increases in production costs, or other unanticipated developments may result in the revenues from the sale of the livestock not being adequate to fully repay the loans. Adverse classification may then be appropriate, depending upon the support of secondary repayment sources and collateral, and the borrower's overall financial condition and trends.

<u>Production Loans</u> **-** These loans are generally not subject to adverse classification if the debtor has good liquidity and/or significant fixed asset equities, or if the cash flow information suggests that current year's operations should be sufficient to repay the advances. The examiner should also take into account any governmental support programs or Federal crop insurance benefits from which the borrower may benefit. If cash flow from ongoing operations appears insufficient to repay production loans, adverse classification may be in order, depending upon the secondary repayment sources and collateral, and the borrower's overall financial condition and trends.

<u>Breeder Stock Loans</u> **-** These loans are generally not adversely classified if they are adequately secured by the livestock and if the term debt payments are being met through the sale of offspring (or milk and eggs in the case of dairy and poultry operations). If one or both of these conditions is not met, adverse classification may be in order, depending upon the support of secondary repayment sources and collateral, and the borrower's overall financial condition and trends.

<u>Machinery and Equipment Loans</u> **-** Loans for the acquisition of machinery and equipment will generally not be subject to adverse classification if they are adequately secured, structured on an appropriate amortization program (see above), and are paying as agreed. Farm machinery and equipment is often the second largest class of agricultural collateral, hence its existence, general state of repair, and valuation should be verified and documented during the institution's periodic on-site inspections of the borrower's operation. Funding for the payments on machinery and equipment loans sometimes comes, at least in part, from other loans provided by the institution, especially production loans. When this is the case, the question arises whether the payments are truly being "made as agreed." For examination purposes, such loans will be considered to be paying as agreed if cash flow projections, payment history, or other available information, suggests there is sufficient capacity to fully repay the production loans when they mature at the end of the current production cycle. If the machinery and equipment loan is not adequately secured, or if the payments are not being made as agreed, adverse classification should be considered.

<u>Carryover Debt</u> **-** Carryover debt results from the debtor's inability to generate sufficient cash flow to service the obligation as it is currently structured. It therefore tends to contain a greater degree of credit risk and must receive close analysis by the examiner. When carryover debt arises, the institution should determine the basic viability of the borrower's operation, so that an informed decision can be made on whether debt restructuring is appropriate. It will thus be useful for institution management to know how the carryover debt came about: Did it result from the obligor's financial, operational or other managerial weaknesses; from inappropriate credit administration on the institution's part, such as over lending or improper debt structuring; from external events such as adverse weather conditions that affected crop yields; or from other causes? In many instances, it will be in the long-term best interests of both the institution and the debtor to restructure the obligations. The restructured obligation should generally be rescheduled on a term basis and require clearly identified collateral, amortization period, and payment amounts. The amortization period may be intermediate or long term depending upon the useful economic life of the available collateral, and on realistic projections of the operation's payment capacity.

There are no hard and fast rules on whether carryover debt should be adversely classified, but the decision should generally consider the following: borrower's overall financial condition and trends, especially financial leverage (often measured in farm debtors with the debt-to-assets ratio); profitability levels, trends, and prospects; historical repayment performance; the amount of carryover debt relative to the operation's size; realistic projections of debt service capacity; and the support provided by secondary collateral. Accordingly, carryover loans to borrowers who are moderately to highly leveraged, who have a history of weak or no profitability and barely sufficient cash flow projections, as well as an adequate but slim collateral margin, will generally be adversely classified, at least until it is demonstrated through actual repayment performance that there is adequate capacity to service the rescheduled obligation. The classification severity will normally depend upon the collateral position. At the other extreme are cases where the customer remains fundamentally healthy financially, generates good profitability and ample cash flow, and who provides a comfortable margin in the security pledged. Carryover loans to this group of borrowers will not ordinarily be adversely classified.

Installment Loans

An installment loan portfolio is usually comprised of a large number of small loans scheduled to be amortized over a specific period. Most installment loans are made directly for consumer purchases, but business loans granted for the purchase of heavy equipment or industrial vehicles may also be included. In addition, the department may grant indirect loans for the purchase of consumer goods.

The examiner's emphasis in reviewing the installment loan department should be on the overall procedures, policies and credit qualities. The goal should not be limited to identifying current portfolio problems, but should include potential future problems that may result from ineffective policies, unfavorable trends, potentially dangerous concentrations, or nonadherence to established policies. Direct installment lending policies typically address the following factors: loan applications and credit checks; terms in relation to collateral; collateral margins; perfection of liens; extensions, renewals and rewrites; delinquency notification and follow-up; and charge-offs and collections. For indirect lending, the policy typically addresses direct payment to the institution versus payment to the dealer, acquisition of dealer financial information, possible upper limits for any one dealer's paper, other standards governing acceptance of dealer paper, and dealer reserves and charge-backs.

Lease Accounting

ASC Topic 840, *Leases*, is the current lease accounting standard for non-public business entities and entities that have not adopted ASC Topic 842, *Leases*. ASC Topic 842 is effective for public business entities (as defined in U.S. GAAP) and will become effective for banks that are not public business entities, for fiscal years beginning after December 15, 2019, and interim reporting periods within fiscal years beginning after December 15, 2020. As such, a calendar year end non-public business entity's first reporting period will be December 31, 2020. Early adoption is permitted.

Direct Lease Financing

Leasing is a recognized form of term debt financing for fixed assets. While leases differ from loans in some respects, they are similar from a credit viewpoint because the basic considerations are cash flow, repayment capacity, credit history, management and projections of future operations. Additional considerations for a lease transaction are the property type and its marketability in the event of default or lease termination. Those latter considerations do not radically alter the manner in which an examiner evaluates collateral for a lease. The assumption is that the lessee/borrower will generate sufficient funds to liquidate the lease/debt. Sale of leased property/collateral remains a secondary repayment source and, except for the estimated residual value at the expiration of the lease, will not, in most cases, become a factor in liquidating the advance. When the institution is requested to purchase property of significant value for lease, it may issue a commitment to lease, describing the property, indicating cost, and generally outlining the lease terms. After all terms in the lease transaction are resolved by negotiation between the institution and its customer, an order is usually written requesting the institution to purchase the property. Upon receipt of that order, the institution purchases the property requested and arranges for delivery and, if necessary, installation. A lease contract is drawn incorporating all the points covered in the commitment letter, as well as the rights of the institution and lessee in the event of default. The lease contract is generally signed simultaneously with the signing of the order to purchase and the agreement to lease.

Lessor Accounting under ASC Topic 840

The types of assets that may be leased are numerous, and the accounting for direct leasing is a complex subject which is discussed in detail in ASC Topic 840, *Leases*. Familiarity with ASC Topic 840 is a prerequisite for the management of any institution engaging in or planning to engage in direct lease financing. The following terms are commonly encountered in direct lease financing:

- Net Lease, one in which the institution is not directly or indirectly obligated to assume the expenses of maintaining the equipment. This restriction does not prohibit the institution from paying delivery and set up charges on the property.
- Full Payout Lease, one for which the institution expects to realize both the return of its full investment and the cost of financing the property over the term of the lease. This payout can come from rentals, estimated tax benefits, and estimated residual value of the property.
- Leveraged Lease, in which the institution as lessor purchases and becomes the equipment owner by providing a relatively small percentage (20-40%) of the capital needed. Balance of the funds is borrowed by the lessor from long-term lenders who hold a first lien on the equipment and assignments of the lease and lease rental payments. This specialized and complex form of leasing is prompted mainly by a desire on the part of the lessor to shelter income from taxation. Creditworthiness of the lessee is paramount and the general rule is an institution should not enter into a leveraged lease transaction with any party to whom it would not normally extend unsecured credit.
- Rentals, which include only those payments reasonably anticipated by the institution at the time the lease is executed.

Lessor Accounting under ASC Topic 842

ASC Topic 842, *Leases* does not fundamentally change lessor accounting; however, it aligns terminology between lessee and lessor accounting and brings key aspects of lessor accounting into alignment with the FASB's new revenue recognition guidance in ASC Topic 606. As a result, the classification difference between direct financing leases and sales-type leases for lessors moves from a risk-and-rewards principle to a transfer of control principle. As such, an institution as lessor is required to classify a lease as a sales-type, direct financing, or operating leases. Additionally, there is no longer a distinction in the treatment of real estate and non-real estate leases by lessors.

Leases classified as leveraged leases prior to the adoption of ASC Topic 842 may continue to be accounted for under ASC Topic 840 unless subsequently modified. ASC Topic 842 eliminates leveraged lease accounting for leases that commence after an institution adopts the new accounting standard.

For more information refer to the Call Report Glossary for the accounting for leases or ASC Topic 842.

Examiner Consideration

Examiners should determine whether bank management carefully evaluates all lease variables, including the estimate of the residual value. Institutions may be able to realize unwarranted lease income in the early years of a contract by manipulating the lease variables. In addition, an institution can offer the lessee a lower payment by assuming an artificially high residual value during the initial structuring of the lease. But this technique may present the institution with serious long-term problems because of the reliance on speculative or nonexistent residual values.

Often, lease contracts contain an option permitting the lessee to continue use of the property at the end of the original term, working capital restrictions and other restrictions or requirements similar to debt agreements and lease termination penalties. Each lease is an individual contract written to fulfill the lessee's needs. Consequently, there may be many variations of each of the above provisions. However, the underlying factors remain the same: there is a definite contractual understanding of the positive right to use the property for a specific period of time, and required payments are irrevocable.

Examination procedures for reviewing lease financing activities are included in the ED Modules in the Loan References section.

Floor Plan Loans

Floor plan (wholesale) lending is a form of retail goods inventory financing in which each loan advance is made against a specific piece of collateral. As each piece of collateral is sold by the dealer, the loan advance against that piece of collateral is repaid. Items commonly subject to floor plan debt are automobiles, home appliances, furniture, television and stereophonic equipment, boats, mobile homes and other types of merchandise usually sold under a sales finance contract. Drafting agreements are a relatively common approach utilized in conjunction with floor plan financing. Under this arrangement, the institution establishes a line of credit for the borrower and authorizes the good's manufacturer to draw drafts on the institution in payment for goods shipped. The institution agrees to honor these drafts, assuming proper documentation (such as invoices, manufacturer's statement of origin, etc.) is provided. The method facilitates inventory purchases by, in effect, guaranteeing payment to the manufacturer for merchandise supplied. Floor plan loans involve all the basic risks inherent in any form of inventory financing. However, because of the banker's inability to exercise full control over the floored items, the exposure to loss may be greater than in other similar types of financing. Most dealers have minimal capital bases relative to debt. As a result, close and frequent review of the dealer's financial information is necessary. As with all inventory financing, collateral value is of prime importance. Control requires the institution to determine the collateral value at the time the loan is placed on the books, frequently inspect the collateral to determine its condition, and impose a curtailment requirement sufficient to keep collateral value in line with loan balances.

Handling procedures for floor plan lines will vary greatly depending on institution size and location, dealer size and the type of merchandise being financed. In many cases, the term "trust receipt" is used to describe the debt instrument existing between the institution and the dealer. Trust receipts may result from drafting agreements between an institution and a manufacturer for the benefit of a dealer. In other instances, the dealer may order inventory, bring titles or invoices to the institution, and then obtain a loan secured or to be secured by the inventory. Some banks may use master debt instruments, and others may use a trust receipt or note for each piece of inventory. The method of perfecting a security interest also varies from state to state. The important point is that an institution enacts realistic handling policies and ensures that its collateral position is properly protected.

Examination procedures and examiner considerations for reviewing floor plan lending activities are included in the ED Modules in the Loan References section.

Check Credit and Credit Card Loans

Check credit is defined as the granting of unsecured revolving lines of credit to individuals or businesses. Check credit services are provided by the overdraft system, cash reserve system, and special draft system. The most common is the overdraft system. In that method, a transfer is made from a pre-established line of credit to a customer's demand deposit account when a check which would cause an overdraft position is presented. Transfers normally are made in stated increments, up to the maximum line of credit approved by the institution, and the customer is notified that the funds have been transferred. In a cash reserve system, customers must request that the institution transfer funds from their pre-established line of credit to their demand deposit account before negotiating a check against them. A special draft system involves the customer negotiating a special check drawn directly against a pre-established line of credit. In that method, demand deposit accounts are not affected. In all three systems, the institution periodically provides its check credit customers with a statement of account activity. Required minimum payments are computed as a fraction of the balance of the account on the cycle date and may be made by automatic charges to a demand deposit account.

Most institution credit card plans are similar. The institution solicits retail merchants, service organizations and others who agree to accept a credit card in lieu of cash for sales or services rendered. The parties also agree to a discount percentage of each sales draft and a maximum dollar amount per transaction. Amounts exceeding that limit require prior approval by the institution. Merchants also may be assessed a fee for imprinters or promotional materials. The merchant deposits the institution credit card sales draft at the institution and receives immediate credit for the discounted amount. The institution assumes the credit risk and charges the nonrecourse sales draft to the individual customer's credit card account. Monthly statements are rendered by the institution to the customer who may elect to remit the entire amount, generally without service charge, or pay in monthly installments, with an additional percentage charged on the outstanding balance each month. A cardholder also may obtain cash advances from the institution or dispensing machines. Those advances accrue interest from the transaction date. An institution may be involved in a credit card plan in three ways:

- Agent Bank, which receives credit card applications from customers and sales drafts from merchants and forwards such documents to banks described below, and is accountable for such documents during the process of receiving and forwarding.
- Sublicensee Bank, which maintains accountability for credit card loans and merchant's accounts; may maintain its own center for processing payments and drafts; and may maintain facilities for embossing credit cards.
- Licensee Bank, which is the same as sublicensee institution, but in addition may perform transaction processing and credit card embossing services for sublicensee banks, and also acts as a regional or national clearinghouse for sublicensee banks.

Check credit and credit card loan policies typically address procedures for careful screening of account applicants; establishment of internal controls to prevent interception of cards before delivery, merchants from obtaining control of cards, or customers from making fraudulent use of lost or stolen card; frequent review of delinquent accounts, accounts where payments are made by drawing on reserves, and accounts with steady usage; delinquency notification procedures; guidelines for realistic charge-offs; removal of accounts from delinquent status (curing) through performance not requiring a catch-up of delinquent principal; and provisions that preclude automatic reissuance of expired cards to obligors with charged-off balances or an otherwise unsatisfactory credit history with the institution.

Examination procedures for reviewing these activities are included in the ED Modules. Also, the FDIC has separate manuals on Credit Card Specialty Bank Examination Guidelines and Credit Card Securitization Activities.

Credit Card-related Merchant Activities

Merchant credit card activities basically involve the acceptance of credit card sales drafts for clearing by a financial institution (clearing institution). For the clearing institution, these activities are generally characterized by thin profit margins amidst high transactional and sales volumes. Typically, a merchant's customer will charge an item on a credit card, and the clearing institution will give credit to the merchant's account. Should the customer dispute a charge transaction, the clearing institution is obligated to honor the customer's legitimate request to reverse the transaction. The Clearing Institution must then seek reimbursement from the merchant. Problems arise when the merchant is not creditworthy and is unable, or unwilling, to reimburse the clearing institution. In these instances, the clearing institution will incur a loss. Examiners should review for the existence of any such contingent liabilities.

To avoid losses and to ensure the safe and profitable operation of a clearing institution's credit card activities, the merchants with whom it contracts for clearing services should be financially sound and honestly operated. To this end, safe and sound merchant credit card activities include clear and detailed acceptance standards for merchants, such as the following:

- Scrutinizing prospective merchants using the same care and diligence used in evaluating prospective borrowers.
- Closely monitoring merchants with controls to ensure that early warning signs are recognized so that problem merchants can be removed from a clearing institution's program promptly to minimize loss exposure.
- Establishing an account administration program that incorporates periodic reviews of merchants' financial statements and business activities in cases of merchants clearing large dollar volumes.
- Establishing an internal periodic reporting system of merchant account activities regardless of the amount or number of transactions cleared, with these reports reviewed for irregularities so problematic merchant activity is identified quickly.
- Developing policies that follow the guidelines established by the card issuing networks.

Another possible problem with merchant activities involves clearing institutions that sometimes engage the services of agents, such as an independent sales organization (ISO). ISOs solicit merchants' credit card transactions for a clearing institution. In some cases, the ISOs actually contract with merchants on behalf of clearing institutions. Some of these contracts are entered into by the ISOs without the review and approval of the clearing institutions. At times, clearing institutions unfortunately rely too much on the ISOs to oversee account activity. In some cases, clearing institutions have permitted ISOs to contract with disreputable merchants. Because of the poor condition of the merchant, or ISO, or both, these clearing institutions can ultimately incur heavy losses.

A financial institution with credit card clearing activities typically develops its own internal controls and procedures to ensure sound agent selection standards before engaging an ISO. ISOs that seek to be compensated solely on the basis of the volume of signed-up merchants should be carefully scrutinized. A clearing institution should adequately supervise the ISO's activities, just as the institution would supervise any third party engaged to perform services for any aspect of the institution's operations. Also, institutions typically and appropriately reserve the right to ratify or reject any merchant contract that is initiated by an ISO.

Examination procedures for reviewing credit card related merchant activities are included in the ED Modules in the Supplemental Modules Section and in the Credit Card Activities Manual.

OTHER CREDIT ISSUES

Appraisals

Appraisals are professional judgments of the market value of real property. Three basic valuation approaches are used by professional appraisers in estimating the market value of real property; the cost approach, the market data or direct sales comparison approach, and the income approach. The principles governing the three approaches are widely known in the appraisal field and are referenced in parallel regulations issued by each of the Federal banking agencies. When evaluating collateral, the three valuation approaches are not equally appropriate.

- **Cost Approach -** In this approach, the appraiser estimates the reproduction cost of the building and improvements, deducts estimated depreciation, and adds the value of the land. The cost approach is particularly helpful when reviewing draws on construction loans. However, as the property increases in age, both reproduction cost and depreciation become more difficult to estimate. Except for special purpose facilities, the cost approach is usually inappropriate in a troubled real estate market because construction costs for a new facility normally exceed the market value of existing comparable properties.

- **Market Data or Direct Sales Comparison Approach -** This approach examines the price of similar properties that have sold recently in the local market, estimating the value of the subject property based on the comparable properties' selling prices. It is very important that the characteristics of the observed transactions be similar in terms of market location, financing terms, property condition and use, timing, and transaction costs. The market approach generally is used in valuing owner-occupied residential property because comparable sales data is typically available. When adequate sales data is available, an analyst generally will give the most weight to this type of estimate. Often, however, the available sales data for commercial properties is not sufficient to justify a conclusion.
- **The Income Approach -** The economic value of an income-producing property is the discounted value of the future net operating income stream, including any "reversion" value of property when sold. If competitive markets are working perfectly, the observed sales price should be equal to this value. For unique properties or in depressed markets, value based on a comparable sales approach may be either unavailable or distorted. In such cases, the income approach is usually the appropriate method for valuing the property. The income approach converts all expected future net operating income into present value terms. When market conditions are stable and no unusual patterns of future rents and occupancy rates are expected, the direct capitalization method is often used to estimate the present value of future income streams. For troubled properties, however, the more explicit discounted cash flow (net present value) method is more typically utilized for analytical purposes. In the rent method, a time frame for achieving a "stabilized", or normal, occupancy and rent level is projected. Each year's net operating income during that period is discounted to arrive at present value of expected future cash flows. The property's anticipated sales value at the end of the period until stabilization (its terminal or reversion value) is then estimated. The reversion value represents the capitalization of all future income streams of the property after the projected occupancy level is achieved. The terminal or reversion value is then discounted to its present value and added to the discounted income stream to arrive at the total present market value of the property.

Valuation of Troubled Income-Producing Properties

When an income property is experiencing financial difficulties due to general market conditions or due to its own characteristics, data on comparable property sales is often difficult to obtain. Troubled properties may be hard to market, and normal financing arrangements may not be available. Moreover, forced and liquidation sales can dominate market activity. When the use of comparables is not feasible (which is often the case for commercial properties), the net present value of the most reasonable expectation of the property's income-producing capacity - not just in today's market but over time - offers the most appropriate method of valuation in the supervisory process.

Estimates of the property's value should be based upon reasonable and supportable projections of the determinants of future net operating income: rents (or sales), expenses, and rates of occupancy. The primary considerations for these projections include historical levels and trends, the current market performance achieved by the subject and similar properties, and economically feasible and defensible projections of future demand and supply conditions. If current market activity is dominated by a limited number of transactions or liquidation sales, high capitalization and discount rates implied by such transactions should not be used. Rather, analysts should use rates that reflect market conditions that are neither highly speculative nor depressed.

Appraisal Regulation

Title XI of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 requires that appraisals prepared by certified or licensed appraisers be obtained in support of real estate lending and mandates that the Federal financial institutions regulatory agencies adopt regulations regarding the preparation and use of appraisals in certain real estate related transactions by financial institutions under their jurisdiction. In addition, Title XI created the Appraisal Subcommittee (Subcommittee) of the Federal Financial Institutions Examination Council (FFIEC) to provide oversight of the real estate appraisal process as it relates to federally related real estate transactions. The Subcommittee is composed of six members, each of whom is designated by the head of their respective agencies. Each of the five financial institution regulatory agencies which comprise the FFIEC and the U.S. Department of Housing and Urban Development are represented on Subcommittee. A responsibility of the Subcommittee is to monitor the state certification and licensing of appraisers. It has the authority to disapprove a state appraiser regulatory program, thereby disqualifying the state's licensed and certified appraisers from conducting appraisals for federally related transactions.

The Subcommittee gets its funding by charging state certified and licensed appraisers an annual registration fee. The fee income is used to cover Subcommittee administrative expenses and to provide grants to the Appraisal Foundation.

Formed in 1987, the Appraisal Foundation was established as a private not for profit corporation bringing together interested parties within the appraisal industry, as well as users of appraiser services, to promote professional standards within the appraisal industry. The Foundation sponsors two independent boards referred to in Title XI, The Appraiser Qualifications Board (AQB) and The Appraisal Standards Board (ASB). Title XI specifies that the minimum standards for state appraiser certification are to be the criteria for certification issued by the AQB. Title XI does not set specific criteria for the licensed classification. These are individually determined by each state. Additionally, Title XI requires that the appraisal standards prescribed by the Federal agencies, at a minimum, must be the appraisal standards promulgated by the ASB. The ASB has issued The Uniform Standards of Professional Appraisal Practice (USPAP) which set the appraisal industry standards for conducting an appraisal of real estate. To the appraisal industry, USPAP is analogous to generally accepted accounting principles for the accounting profession.

In conformance with Title XI, Part 323 of the FDIC regulations identifies which real estate related transactions require an appraisal by a certified or licensed appraiser and establishes minimum standards for performing appraisals. Substantially similar regulations have been adopted by each of the Federal financial institutions regulatory agencies.

Real estate-related transactions include real estate loans, mortgage-backed securities, institution premises, real estate investments, and other real estate owned. All real estate-related transactions by FDIC-insured institutions not specifically exempt are, by definition, "federally related transactions" subject to the requirements of the regulation. Exempt real estate-related transactions include:

- The transaction value is $250,000 or less;
- A lien on real estate has been taken as collateral in an abundance of caution;
- The transaction is not secured by real estate;
- A lien on real estate has been taken for purposes other than the real estate's value;
- The transaction is a business loan that: (i) has a transaction value of $1 million or less; and (ii) is not dependent on the sale of, or rental income derived from, real estate as the primary source of repayment;
- A lease of real estate is entered into, unless the lease is the economic equivalent of a purchase or sale of the leased real estate;
- The transaction involves an existing extension of credit at the lending institution, provided that: (i) There has been no obvious and material change in the market conditions or physical aspects of the property that threatens the adequacy of the institution's real estate collateral protection after the transaction, even with the advancement of new monies; or (ii) There is no advancement of new monies, other than funds necessary to cover reasonable closing costs;
- The transaction involves the purchase, sale, investment in, exchange of, or extension of credit secured by, a loan or interest in a loan, pooled loans, or interests in real property, including mortgage-backed securities, and each loan or interest in a loan, pooled loan, or real property interest met FDIC regulatory requirements for appraisals at the time of origination;
- The transaction is wholly or partially insured or guaranteed by a United States government agency or United States government sponsored agency;
- The transaction either; (i) Qualifies for sale to a United States government agency or United States government sponsored agency; or (ii) Involves a residential real estate transaction in which the appraisal conforms to the Federal National Mortgage Association or Federal Home Loan Mortgage Corporation appraisal standards applicable to that category of real estate;
- The regulated institution is acting in a fiduciary capacity and is not required to obtain an appraisal under other law; or
- The FDIC determines that the services of an appraiser are not necessary in order to protect Federal financial and public policy interests in real estate-related financial transaction or to protect the safety and soundness of the institution.
- The transaction is a commercial real estate transaction that has a transaction value of $500,000 or less.

Section 323.4 establishes minimum standards for all appraisals in connection with federally related transactions. Appraisals performed in conformance with the regulation must conform to the requirements of the USPAP and certain other listed standards. The applicable sections of USPAP are the Preamble (ethics and competency), Standard 1 (appraisal techniques), Standard 2 (report content), and Standard 3 (review procedures). USPAP Standards 4 through 10 concerning appraisal services and appraising personal property do not apply to federally related transactions.

An appraisal satisfies the regulation if it is performed in accordance with all of its provisions and it is still current and meaningful. In other words, a new appraisal does not necessarily have to be done every time there is a transaction, provided the institution has an acceptable process in place to review existing appraisals.

Adherence to the appraisal regulations should be part of the examiner's overall review of the lending function. An institution's written appraisal program should contain specific administrative review procedures that provide some evidence, such as a staff member's signature on an appraisal checklist that indicates the appraisal was reviewed and that all standards were met. In addition, the regulation requires that the appraisal contain the appraiser's certification that it was prepared in conformance with USPAP. When analyzing individual transactions, examiners should review appraisal reports to determine the institution's conformity to its own internal appraisal policies and for compliance with the regulation. Examiners may need to conduct a more detailed review if the appraisal does not have sufficient information, does not explain assumptions, is not logical, or has other major deficiencies that cast doubt as to the validity of its opinion of value. Examination procedures regarding appraisal reviews are included in the Examination Documentation Modules.

Loans in a pool such as an investment in mortgage- backed securities or collateralized mortgage obligations should have some documented assurance that each loan in the pool has an appraisal in accordance with the regulation. Appropriate evidence could include an issuer's certification of compliance.

All apparent violations of Part 323 should be listed in the examination report in the usual manner. Significant systemic failures to meet standards and procedures could call for formal corrective measures.

Interagency Appraisal and Evaluation Guidelines

The Interagency Appraisal and Evaluation Guidelines dated December 2, 2010 address supervisory matters relating to real estate-related financial transactions and provide guidance to examining personnel and federally regulated institutions about prudent appraisal and evaluation policies, procedures, practices, and standards that are consistent with the appraisal regulation.

An institution's real estate appraisal and evaluation policies and procedures will be reviewed as part of the examination of the institution's overall real estate-related activities. An institution's policies and procedures typically are incorporated into an effective appraisal and evaluation program. Examiners will consider the institution's size and the nature of its real estate-related activities when assessing the appropriateness of its program.

When analyzing individual transactions, examiners should review an appraisal or evaluation to determine whether the methods, assumptions, and findings are reasonable and comply with the agencies' appraisal regulations and the institution’s internal policies. Examiners also will review the steps taken by an institution to ensure that the individuals who perform its appraisals and evaluations are qualified and are not subject to conflicts of interest. Institutions that fail to maintain a sound appraisal or evaluation program or to comply with the agencies' appraisal regulations will be cited in examination reports and may be criticized for unsafe and unsound banking practices. Deficiencies will require corrective action.

Appraisal and Evaluation Program **-** An institution's board of directors is responsible for reviewing and adopting policies and procedures that establish an effective real estate appraisal and evaluation program. Effective programs:

- Establish selection criteria and procedures to evaluate and monitor the ongoing performance of individuals who perform appraisals or evaluations;
- Provide for the independence of the person performing appraisals or evaluations;
- Identify the appropriate appraisal for various lending transactions;
- Establish criteria for contents of an evaluation;
- Provide for the receipt of the appraisal or evaluation report in a timely manner to facilitate the underwriting decision;
- Assess the validity of existing appraisals or evaluations to support subsequent transactions;
- Establish criteria for obtaining appraisals or evaluations for transactions that are otherwise exempt from the agencies' appraisal regulations; and
- Establish internal controls that promote compliance with these program standards.

<u>Selection of Individuals Who May Perform Appraisals and Evaluations</u> **-** An institution's program establishes criteria to select, evaluate, and monitor the performance of the individual(s) who performs a real estate appraisal or evaluation. Appropriate criteria ensure that:

- The selection process is non-preferential and unbiased;
- The individual selected possesses the requisite education, expertise and competence to complete the assignment;
- The individual selected is capable of rendering an unbiased opinion; and

- The individual selected is independent and has no direct or indirect interest, financial or otherwise, in the property or the transaction.

Under the agencies' appraisal regulations, the appraiser must be selected and engaged directly by the institution or its agent. The appraiser's client is the institution, not the borrower. Also, an institution may not use an appraisal that has been “readdressed” – appraisal reports that are altered by the appraiser to replace any references to the original client with the institution’s name. An institution may use an appraisal that was prepared by an appraiser engaged directly by another financial services institution, as long as the institution determines that the appraisal conforms to the agencies' appraisal regulations and is otherwise acceptable.

<u>Independence of the Appraisal and Evaluation Function</u> **-** Because the appraisal and evaluation process is an integral component of the credit underwriting process, it should be isolated from influence by the institution's loan production process. An appraiser and an individual providing evaluation services should be independent of the loan and collection functions of the institution and have no interest, financial or otherwise, in the property or the transaction. In addition, individuals independent from the loan production area should oversee the selection of appraisers and individuals providing evaluation services. If absolute lines of independence cannot be achieved, an institution must be able to clearly demonstrate that it has prudent safeguards to isolate its collateral evaluation process from influence or interference from the loan production process. That is, no single person should have sole authority to render credit decisions on loans which they ordered or reviewed appraisals or evaluations.

The agencies recognize, however, that it is not always possible or practical to separate the loan and collection functions from the appraisal or evaluation process. In some cases, such as in a small or rural institution or branch, the only individual qualified to analyze the real estate collateral may also be a loan officer, other officer, or director of the institution. To ensure their independence, such lending officials, officers, or directors abstain from any vote or approval involving loans on which they performed an appraisal or evaluation.

<u>Transactions That Require Appraisals</u> **-** Although the agencies' appraisal regulations exempt certain categories of real estate-related financial transactions from the appraisal requirements, most real estate transactions over $250,000 ($500,000 for commercial real estate transactions) are considered federally related transactions and thus require appraisals. A "federally related transaction" means any real estate-related financial transaction, in which the agencies engage, contract for, or regulate and that requires the services of an appraiser. An agency also may impose more stringent appraisal requirements than the appraisal regulations require, such as when an institution's troubled condition is attributable to real estate loan underwriting problems.

<u>Minimum Appraisal Standards</u> **-** The agencies' appraisal regulations include five minimum standards for the preparation of an appraisal. The appraisal must:

- Conform to generally accepted appraisal standards as evidenced by the Uniform Standards of Professional Appraisal Practice (USPAP) promulgated by the Appraisal Standards Board (ASB) of the Appraisal Foundation unless principles of safe and sound banking require compliance with stricter standards. Although allowed by USPAP, the agencies' appraisal regulations do not permit an appraiser to appraise any property in which the appraiser has an interest, direct or indirect, financial or otherwise;
- Be written and contain sufficient information and analysis to support the institution's decision to engage in the transaction. As discussed below, appraisers have available various appraisal development and report options; however, not all options may be appropriate for all transactions. A report option is acceptable under the agencies' appraisal regulations only if the appraisal report contains sufficient information and analysis to support an institution's decision to engage in the transaction.
- Analyze and report appropriate deductions and discounts for proposed construction or renovation, partially leased buildings, non-market lease terms, and tract developments with unsold units. This standard is designed to avoid having appraisals prepared using unrealistic assumptions and inappropriate methods. For federally related transactions, an appraisal is to include the current market value of the property in its actual physical condition and subject to the zoning in effect as of the date of the appraisal. For properties where improvements are to be constructed or rehabilitated, the regulated institution may also request a prospective market value based on stabilized occupancy or a value based on the sum of retail sales. However, the sum of retail sales for a proposed development is not the market value of the development for the purpose of the agencies' appraisal regulations. For proposed developments that involve the sale of individual houses, units, or lots, the appraiser must analyze and report appropriate deductions and discounts for holding costs, marketing costs and entrepreneurial profit. For proposed and rehabilitated rental developments, the appraiser must make appropriate deductions and discounts for items such as leasing commission, rent losses, and tenant

improvements from an estimate based on stabilized occupancy;
- Be based upon the definition of market value set forth in the regulation. Each appraisal must contain an estimate of market value, as defined by the agencies' appraisal regulations; and,
- Be performed by state licensed or certified appraisers in accordance with requirements set forth in the regulation.

Appraisal Options - An appraiser typically uses three market value approaches to analyze the value of a property cost, income, and sales market. The appraiser reconciles the results of each approach to estimate market value. An appraisal will discuss the property's recent sales history and contain an opinion as to the highest and best use of the property. An appraiser must certify that he/she has complied with USPAP and is independent. Also, the appraiser must disclose whether the subject property was inspected and whether anyone provided significant assistance to the person signing the appraisal report.

An institution may engage an appraiser to perform either a Complete or Limited Appraisal. When performing a Complete Appraisal assignment, an appraiser must comply with all USPAP standards - without departing from any binding requirements - and specific guidelines when estimating market value. When performing a Limited Appraisal, the appraiser elects to invoke the Departure Provision which allows the appraiser to depart, under limited conditions, from standards identified as specific guidelines. For example, in a Limited Appraisal, the appraiser might not utilize all three approaches to value; however, departure from standards designated as binding requirements is not permitted. There are numerous binding requirements which are detailed in the USPAP. Use of the USPAP Standards publication as a reference is recommended. The book provides details on each appraisal standard and advisory opinions issued by the Appraisal Standards Board.

An institution and appraiser must concur that use of the Departure Provision is appropriate for the transaction before the appraiser commences the appraisal assignment. The appraiser must ensure that the resulting appraisal report will not mislead the institution or other intended users of the appraisal report. The agencies do not prohibit the use of a Limited Appraisal for a federally related transaction, but the agencies believe that institutions should be cautious in their use of a Limited Appraisal because it will be less thorough than a Complete Appraisal.

Complete and Limited Appraisal assignments may be reported in three different report formats: a Self-Contained Report, a Summary Report, or a Restricted Report. The major difference among these three reports relates to the degree of detail presented in the report by the appraiser. The Self-Contained Appraisal Report provides the most detail, while the Summary Appraisal Report presents the information in a condensed manner. The Restricted Report provides a capsulated report with the supporting details maintained in the appraiser's files.

The agencies believe that the Restricted Report format will not be appropriate to underwrite a significant number of federally related transactions due to the lack of sufficient supporting information and analysis in the appraisal report. However, it might be appropriate to use this type of appraisal report for ongoing collateral monitoring of an institution's real estate transactions and under other circumstances when an institution's program requires an evaluation.

Moreover, since the institution is responsible for selecting the appropriate appraisal report to support its underwriting decisions, its program should identify the type of appraisal report that will be appropriate for various lending transactions. The institution's program should consider the risk, size, and complexity of the individual loan and the supporting collateral when determining the level of appraisal development and the type of report format that will be ordered. When ordering an appraisal report, institutions may want to consider the benefits of a written engagement letter that outlines the institution's expectations and delineates each party's responsibilities, especially for large, complex, or out-of-area properties.

Transactions That Require Evaluations - A formal opinion of market value prepared by a state licensed or certified appraiser is not always necessary. Instead, less formal evaluations of the real estate may suffice for transactions that are exempt from the agencies' appraisal requirements.

Additionally, prudent institutions establish criteria for obtaining appraisals or evaluations for safety and soundness reasons for transactions that are otherwise exempt from the agencies' appraisal regulations.

Evaluation Content - Prudent standards for preparing evaluations typically require that evaluations:

- Be written;
- Include the preparer's name, address, and signature, and the effective date of the evaluation;
- Describe the real estate collateral, its condition, its current and projected use;
- Describe the source(s) of information used in the analysis;
- Describe the analysis and supporting information, and;

- Provide an estimate of the real estate's market value, with any limiting conditions.

An appropriate evaluation report includes calculations, supporting assumptions, and, if utilized, a discussion of comparable sales. Documentation should be sufficient to allow an institution to understand the analysis, assumptions, and conclusions. An institution's own real estate loan portfolio experience and value estimates prepared for recent loans on comparable properties might provide a basis for evaluations.

An appropriate evaluation provides an estimate of value to assist the institution in assessing the soundness of the transaction. Prudent practices may include more detailed evaluations as an institution engages in more complex real estate-related financial transactions, or as its overall exposure increases. For example, an evaluation for a home equity loan might be based primarily on information derived from a sales data services organization or current tax assessment information, while an evaluation for an income-producing real estate property describes the current and expected use of the property and includes an analysis of the property's rental income and expenses.

Qualifications of Evaluation Providers **-** Individuals who prepare evaluations should have real estate-related training or experience and knowledge of the market relevant to the subject property. Based upon their experience and training, professionals from several fields may be qualified to prepare evaluations of certain types of real estate collateral. Examples include individuals with appraisal experience, real estate lenders, consultants or sales persons, agricultural extension agents, or foresters. Institutions should document the qualifications and experience level of individuals whom the institution deems acceptable to perform evaluations. An institution might also augment its in-house expertise and hire an outside party familiar with a certain market or a particular type of property. Although not required, an institution may use state licensed or certified appraisers to prepare evaluations. As such, Limited Appraisals reported in a Summary or Restricted format may be appropriate for evaluations of real estate-related financial transactions exempt from the agencies' appraisal requirements.

Valid Appraisals and Evaluations **-** The institution may use an existing appraisal or evaluation to support a subsequent transaction, if the institution documents that the existing estimate of value remains valid. Therefore, a prudent appraisal and evaluation program includes criteria to determine whether an existing appraisal or evaluation remains valid to support a subsequent transaction. Criteria for determining whether an existing appraisal or evaluation remains valid will vary depending upon the condition of the property and the marketplace, and the nature of any subsequent transaction. Factors that could cause changes to originally reported values include: the passage of time; the volatility of the local market; the availability of financing; the inventory of competing properties; improvements to, or lack of maintenance of, the subject property or competing surrounding properties; changes in zoning; or environmental contamination. The institution must document the information sources and analyses used to conclude that an existing appraisal or evaluation remains valid for subsequent transactions.

Renewals, Refinancings, and Other Subsequent Transactions **-** The agencies' appraisal regulations generally allow appropriate evaluations of real estate collateral in lieu of an appraisal for loan renewals and refinancings; however, in certain situations an appraisal is required. If new funds are advanced in excess of reasonable closing costs, an institution is expected to obtain a new appraisal for the renewal of an existing transaction when there is a material change in market conditions or in the physical aspects of the property that threatens the institution's real estate collateral protection.

The decision to reappraise or reevaluate the real estate collateral should be guided by the regulatory exemption for renewals, refinancings, and other subsequent transactions. Loan workouts, debt restructurings, loan assumptions, and similar transactions involving the addition or substitution of borrowers may qualify for the exemption for renewals, refinancings, and other subsequent transactions. Use of this exemption depends on the condition and quality of the loan, the soundness of the underlying collateral and the validity of the existing appraisal or evaluation.

A reappraisal would not be required when an institution advances funds to protect its interest in a property, such as to repair damaged property, because these funds would be used to restore the damaged property to its original condition. If a loan workout involves modification of the terms and conditions of an existing credit, including acceptance of new or additional real estate collateral, which facilitates the orderly collection of the credit or reduces the institution's risk of loss, a reappraisal or reevaluation may be prudent, even if it is obtained after the modification occurs.

An institution may engage in a subsequent transaction based on documented equity from a valid appraisal or evaluation, if the planned future use of the property is consistent with the use identified in the appraisal or evaluation. If a property, however, has reportedly appreciated because of a planned change in use of the property, such as rezoning, an appraisal would be required for a federally related transaction, unless another exemption applied.

Program Compliance - Appropriate appraisal and evaluation programs establish effective internal controls that promote compliance with the program's standards. An individual familiar with the appraisal regulations should ensure that the institution's appraisals and evaluations comply with the appraisal regulations and the institution's program. Typically, loan administration files document this compliance review, although a detailed analysis or comprehensive analytical procedures are not required for every appraisal or evaluation. For some loans, the compliance review may be part of the loan officer's overall credit analysis and may take the form of either a narrative or a checklist. Examiners should determine whether corrective action for noted deficiencies was undertaken by the individual who prepared the appraisal or evaluation.

Effective appraisal and evaluation programs have comprehensive analytical procedures that focus on certain types of loans, such as large-dollar credits, loans secured by complex or specialized properties, non-residential real estate construction loans, or out-of-area real estate. These comprehensive analytical procedures are typically designed to verify that the methods, assumptions, and conclusions are reasonable and appropriate for the transaction and the property. These procedures provide for a more detailed review of selected appraisals and evaluations prior to the final credit decision. The individual(s) performing these reviews should have the appropriate training or experience, and be independent of the transaction.

Appraisers and persons performing evaluations are responsible for any deficiencies in their reports. Deficient reports should be returned to them for correction. Unreliable appraisals or evaluations should be replaced prior to the final credit decision. Examiners should be mindful that changes to an appraisal's estimate of value are permitted only as a result of a review conducted by an appropriately qualified state licensed or certified appraiser in accordance with Standard III of USPAP.

Portfolio Monitoring - The institution also typically develops criteria for obtaining reappraisals or reevaluations as part of a program of prudent portfolio review and monitoring techniques, even when additional financing is not being contemplated. Examples of such types of situations include large credit exposures and out-of-area loans.

Referrals - Financial institutions are encouraged to make referrals directly to state appraiser regulatory authorities when a state licensed or certified appraiser violates USPAP, applicable State law, or engages in other unethical or unprofessional conduct. Examiners finding evidence of unethical or unprofessional conduct by appraisers will forward their findings and recommendations to their supervisory office for appropriate disposition and referral to the State, as necessary.

Examination Treatment

All apparent violations of the appraisal regulation should be described in the schedule of violations of laws and regulations. Management's comments and any commitments for correcting the practices that led to the apparent violation should be included. Violations that are technical in nature and do not impact the value conclusion generally should not require a new appraisal. (These technical violations should not be relisted in subsequent examinations.) Since the point of an appraisal is to help make sound loan underwriting decisions, getting an appraisal on a loan already made simply to fulfill the requirements of the appraisal regulation, would be of little benefit. However, an institution should be expected to obtain a new appraisal on a loan in violation of the appraisal regulation when there is a safety and soundness reason for such action. For example, construction loans and lines of credit need to have the value of the real estate reviewed frequently in order for the institution to properly manage the credit relationship. A new appraisal might also be needed to determine the proper classification for examination purposes of a collateral dependent loan.

Loan Participations

A loan participation is a sharing or selling of ownership interests in a loan between two or more financial institutions. Normally, a lead institution originates the loan and sells ownership interests to one or more participating banks at the time the loan is closed. The lead (originating) institution retains a partial interest in the loan, holds all loan documentation in its own name, services the loan, and deals directly with the customer for the benefit of all participants. Properly structured, loan participations allow selling banks to accommodate large loan requests which would otherwise exceed lending limits, diversify risk, and improve liquidity. Participating banks are able to compensate for low local loan demand or invest in large loans without servicing burdens and origination costs. If not appropriately structured and documented, a participation loan can present unwarranted risks to both the seller and purchaser of the loan. Examiners should determine the nature and adequacy of the participation arrangement as well as analyze the credit quality of the loan.

Accounting

The proper accounting treatment for loan participations is governed by ASC Topic 860, *Transfers and Servicing,* that applies to the transferor (seller) of assets and the transferee (purchaser).

Before considering whether the conditions for a sale have been met, the transfer of a portion of an entire financial asset must first meet the definition of a participating interest.

A participating interest in an entire financial asset, as defined in ASC Topic 860, has all of the following characteristics:

- From the date of transfer, it must represent a proportionate (pro-rata) ownership interest in the entire financial asset;
- From the date of the transfer, all cash flows received from the entire financial asset, except any cash flows allocated as compensation for servicing or other services performed (which must not be subordinated and must not significantly exceed an amount that would fairly compensate a substitute service provider should one be required), must be divided proportionately among the participating interest holders in an amount equal to their share of ownership;
- The rights of each participating interest holder (including the lead lender) must have the same priority, no interest is subordinated to another interest, and no participating interest holder has recourse to the lead lender or another participating interest holder other than standard representations and warranties and ongoing contractual servicing and administration obligations; and
- No party has the right to pledge or exchange the entire financial asset unless all participating interest holders agree to do so.

If the financial asset meets the definition of a participating interest, the institution must then determine if the participating interest qualifies for sale treatment. The sale criteria focus on whether or not control is effectively transferred to the purchaser.

A transfer of an entire financial asset, a group of financial assets, or a participating interest in an entire financial asset in which the transferor surrenders control over those financial assets shall be accounted for as a sale if and only if all of the following conditions are met:

- The transferred financial assets have been isolated from the seller, meaning that the purchaser's interest in the loan is presumptively beyond the reach of the seller and its creditors, even in bankruptcy or other receivership;
- Each purchaser has the right to pledge or exchange its interest in the loan, and there are no conditions that both constrain the purchaser from taking advantage of that right to pledge or exchange and provide more than a trivial benefit to the seller; and
- The seller or their agents do not maintain effective control over the transferred financial assets. Examples of a seller maintaining effective control include an agreement that both entitles and obligates the seller to repurchase or redeem the purchaser's interest in the loan prior to the loan's maturity, an agreement that provides the seller with the unilateral ability to cause the purchaser to return its interest in the loan to the seller (other than through a cleanup call), or an agreement that permits the purchaser to require the seller to repurchase its interest in the loan at a price so favorable to the purchaser that it is probable that the purchaser will require the seller to repurchase.

Right to Repurchase

Some loan participation agreements may give the seller a contractual right to repurchase the participated interest in the loan at any time. In this case, the seller's right to repurchase the participation effectively provides the seller with a call option on a specific asset that would preclude sale accounting if the asset is not readily obtainable in the marketplace. If a loan participation agreement contains such a provision, freestanding or attached, it constrains the purchaser from pledging or exchanging its participating interest, and results in the seller maintaining effective control over the participating interest. In such cases, the transfer would be accounted for as a secured borrowing.

For additional information on the transfer of loan participations refer to the Call Report Glossary entry: “Transfers of Financial Assets”.

Recourse Arrangements

Recourse arrangements may, or may not, preclude loan participations from being accounted for as sales for financial reporting purposes. The date of the participation and the formality of the recourse provision affect the accounting for the transaction. Formal recourse provisions may affect the accounting treatment of a participation depending upon the date that the participation is transferred to another institution. Implicit recourse provisions would not affect the financial reporting treatment of a participation because the accounting standards look to the contractual terms of asset transfers in determining whether or not the criteria necessary for sales accounting treatment have been met. Although implicit recourse provisions would not affect the accounting treatment of a loan participation, they may affect the risk-based capital treatment of a participation.

If an originating selling institution has transferred a loan participation to a participating institution with recourse on or before December 31, 2001, the existence of the recourse obligation in and of itself does not preclude sale accounting for the transfer. If a loan participation transferred with recourse on or before December 31, 2001, meets the three conditions then in effect for the transferor to have surrendered control over the transferred assets, the transfer should be accounted for as a sale for financial reporting purposes. However, a loan participation sold with recourse is subject to the banking agencies' risk-based capital requirements.

If an originating selling institution transfers a loan participation with recourse on or after January 1, 2002, the participation generally will not be considered isolated from the originating lender in an FDIC receivership. Section 360.6 of the FDIC Rules and Regulations limits the FDIC's ability to reclaim loan participations transferred *without recourse* as defined in the regulations, but does not limit the FDIC's ability to reclaim loan participations transferred with recourse. Under Section 360.6, a participation subject to an agreement that requires the originating lender to repurchase the participation or to otherwise compensate the participating institution due to a default on the underlying loan is considered a participation *with recourse*. As a result, a loan participation transferred *with recourse* on or after January 1, 2002, generally should be accounted for as a secured borrowing and not as a sale for financial reporting purposes. This means that the originating lender should not remove the participation from its loan assets on the balance sheet, but should report the loan participation as a secured borrowing.

Call Report Treatment

When a loan participation meets the definition of a participating interest and the conditions for sale treatment are met, the seller removes the participated interest in the loan from the balance sheet. The purchaser reports the participating interest in "Loans" in the Report of Condition, and in Call Report Schedule RC-C - Loans and Lease Financing Receivables, based upon collateral, borrower, or purpose. When a loan participation does not meet the definition of a participating interest, or if a transfer of a participating interest does not meet all of the conditions for sale accounting, the transfer must be reported as a secured borrowing with a pledge of collateral. In these situations, because the transferred loan participation does not qualify for sale accounting, the transferring institution must continue to report the transferred participation (as well as the retained portion of the loan) in "Loans" in the Report of Condition, based upon collateral, borrower, and purpose. As a consequence, the transferred loan participation should be included in the originating lender's loans and leases for purposes of determining the appropriate level for the institution's allowance for loan and lease losses.

The transferring institution should also report the transferred loan participation as a secured borrowing in "Other Borrowed Money" in the Report of Condition.

Independent Credit Analysis

An institution purchasing a participation loan is expected to perform the same degree of independent credit analysis on the loan as if it were the originator. To determine if a participation loan meets its credit standards, a participating institution must obtain all relevant credit information and details on collateral values, lien status, loan agreements and participation agreements before a commitment is made to purchase. The absence of such information may be evidence that the participating institution has not been prudent in its credit decision.

During the life of the participation, the participant should monitor the servicing and the status of the loan. In order to exercise control of its ownership interest, a purchasing institution must ascertain that the selling institution will provide complete and timely credit information on a continuing basis.

The procedures for purchasing loan participations should be provided for in the institution's formal lending policy. The criteria for participation loans should be consistent with that for similar direct loans. The policy would normally require the complete analysis of the credit quality of obligations to be purchased, determination of value and lien status of collateral, and the maintenance of full credit information for the life of the participation.

Participation Agreements

A participation loan can present unique problems if the borrower defaults, the lead institution becomes insolvent, or a party to the participation arrangement does not perform as expected. These contingencies should be considered in a written participation agreement. The agreement should clearly state the limitations the originating and participating banks impose on each other and the rights all parties retain. In addition to the general terms of the participation transaction, comprehensive participation agreements specifically include the following considerations:

- The obligation of the lead institution to furnish timely credit information and to provide notification of material changes in the borrower's status;
- Requirements that the lead institution consult with participants prior to modifying any loan, guaranty, or security agreements and before taking any action on defaulted loans;
- The specific rights and remedies available to the lead and participating banks upon default of the borrower;

- Resolution procedures when the lead and participating banks cannot agree on the handling of a defaulted loan;
- Resolution of any potential conflicts between the lead institution and participants in the event that more than one loan to the borrower defaults; and
- Provisions for terminating the agency relationship between the lead and participating banks upon such events as insolvency, breach of duty, negligence, or misappropriation by one of the parties.

Participations Between Affiliated Institutions

Examiners should ascertain that banks do not relax their credit standards when dealing with affiliated institutions and that participation loans between affiliated institutions comply with Section 23A of the Federal Reserve Act. The Federal Reserve Board's staff has interpreted that the purchase of a participation loan from an affiliate is exempt from Section 23A provided that the commitment to purchase is obtained by the affiliate before the loan is consummated by the affiliate, and the decision to participate is based upon the institution's independent evaluation of the creditworthiness of the loan. If these criteria are not strictly met, the loan participation could be subject to the qualitative and/or quantitative restrictions of Section 23A. Refer to the Related Organizations Section of this Manual which describes transactions with affiliates.

Sales of 100 Percent Loan Participations

In some cases, depository institutions structure loan originations and participations with the intention of selling 100 percent of the underlying loan amount. Certain 100 percent loan participation programs raise unique safety and soundness issues that should be addressed by an institution's policies, procedures and practices.

If not appropriately structured, these 100 percent participation programs can present unwarranted risks to the originating institution including legal, reputation and compliance risks. Therefore, agreements to mitigate these risks clearly state the limitations the originating and participating institutions impose on each other and the rights all parties retain. This typically includes the originating institution stating that loan participants are participating in loans and are not investing in a business enterprise. The policies of an institution engaged in these originations typically address safety and soundness concerns and include criteria to address:

- The program's objectives – these should be of a commercial nature (structured as commercial undertakings and not as investments in securities).
- The plan of distribution – participants should be limited to sophisticated financial and commercial entities and sophisticated persons and the participations should not be sold directly to the public.
- The credit requirements applicable to the borrower - the originating institution should structure 100% loan participation programs only for borrowers who meet the originating institution's credit requirements.
- Access afforded program participants to financial information on the borrower - the originating institution should allow potential loan participants to obtain and review appropriate credit and other information to enable the participants to make an informed credit decision.

Environmental Risk Program

Examiners are to ascertain whether a lending institution has appropriate safeguards and controls to limit exposure to potential environmental liability associated with real property held as collateral. The potential adverse effect of environmental contamination on the value of real property and the potential for liability under various environmental laws have become important factors in evaluating real estate transactions and making loans secured by real estate. Environmental contamination, and liability associated with environmental contamination, may have a significant adverse effect on the value of real estate collateral, which may in certain circumstances cause an insured institution to abandon its right to the collateral. It is also possible for an institution to be held directly liable for the environmental cleanup of real property collateral acquired by the institution. The cost of such a cleanup may exceed by many times the amount of the loan made to the borrower. A loan may be affected adversely by potential environmental liability even where real property is not taken as collateral. For example, a borrower's capacity to make payments on a loan may be threatened by environmental liability to the borrower for the cost of a hazardous contamination cleanup on property unrelated to the loan with the institution. The potential for environmental liability may arise from a variety of Federal and State environmental laws and from common law tort liability.

Guidelines for an Environmental Risk Program

As part of the institution's overall decision-making process, the environmental risk program typically includes procedures for identifying and evaluating potential environmental concerns associated with lending practices and other actions relating to real property. The board of directors normally reviews and approves the program and designates a senior officer knowledgeable in environmental matters responsible for program implementation. The environmental risk program should be tailored to the needs of the lending institution. That is, institutions that have a heavier concentration of loans to higher risk industries or localities of known contamination may require a more elaborate and sophisticated environmental risk program than institutions that lend more to lower risk industries or localities. An effective environmental risk program should provide for staff training, set environmental policy guidelines and procedures, require an environmental review or analysis during the application process, include loan documentation standards, and establish appropriate environmental risk assessment safeguards in loan workout situations and foreclosures.

Examination Procedures

Examiners should review an institution's environmental risk program as part of the examination of its lending and investment activities. When analyzing individual credits, examiners should review the institution's compliance with its own environmental risk program. Failure to establish or comply with an appropriate environmental program should be criticized and corrective action required.

←

LOAN PROBLEMS

It would be impossible to list all sources and causes of problem loans. They cover a multitude of mistakes an institution may permit a borrower to make, as well as mistakes directly attributable to weaknesses in the institution's credit administration and management. Some well-constructed loans may develop problems due to unforeseen circumstances on the part of the borrower; however, institution management must endeavor to protect a loan by every means possible. One or more of the items in the following list is often basic to the development of loan problems.

Many of these items may also be indicative of potential institution fraud and/or insider abuse. Additional information on the warning signs and suggested areas for investigation are included in the Bank Fraud and Insider Abuse Section of this Manual.

Poor Selection of Risks

Problems in this area may reflect the absence of sound lending policies, and/or management's lack of sound credit judgment in advancing certain loans. The following are general types of loans which may fall within the category of poor risk selection. It should be kept in mind that these examples are generalizations, and the examiner must weigh all relevant factors in determining whether a given loan is indeed a poor risk.

- Loans to finance new and untried business ventures which are inadequately capitalized.
- Loans based more upon the expectation of successfully completing a business transaction than on sound worth or collateral.
- Loans for the speculative purchase of securities or goods.
- Collateral loans made without adequate margin of security.
- Loans made because of other benefits, such as the control of large deposit balances, and not based upon sound worth or collateral.
- Loans made without adequate owner equity in underlying real estate security.
- Loans predicated on collateral which has questionable liquidation value.
- Loans predicated on the unmarketable stock of a local corporation when the institution is at the same time lending directly to the corporation. Action which may be beneficial to the institution from the standpoint of the one loan may be detrimental from the standpoint of the other loan.
- Loans which appear to be adequately protected by collateral or sound worth, but which involve a borrower of poor character risk and credit reputation.
- Loans which appear to be adequately protected by collateral, but which involve a borrower with limited or unassessed repayment ability.
- An abnormal amount of loans involving out-of-territory borrowers (excluding large banks properly staffed to handle such loans).
- Loans involving brokered deposits or link financing.

Overlending

It is almost as serious, from the standpoint of ultimate losses, to lend a sound financial risk too much money as it is to lend to an unsound risk. Loans beyond the reasonable capacity of the borrower to repay invariably lead to the development of problem loans.

Failure to Establish or Enforce Liquidation Agreements

Loans granted without a well-defined repayment program violate a fundamental principle of sound lending. Regardless of what appears to be adequate collateral protection, failure to establish at inception or thereafter enforce a program of repayment almost invariably leads to troublesome and awkward servicing problems, and in many instances is responsible for serious loan problems including eventual losses. This axiom of sound lending is important not only from the lender's standpoint, but also the borrower's.

Incomplete Credit Information

Lending errors frequently result because of management's failure to obtain and properly evaluate credit information. Adequate comparative financial statements, income statements, cash flow statements and other pertinent statistical support should be available. Other essential information, such as the purpose of the borrowing and intended plan or sources of repayment, progress reports, inspections, memoranda of outside information and loan conferences, correspondence, etc., should be contained in the institution's credit files. Failure of an institution's management to give proper attention to credit files makes sound credit judgment difficult if not impossible.

Overemphasis on Loan Income

Misplaced emphasis upon loan income, rather than soundness, almost always leads to the granting of loans possessing undue risk. In the long run, unsound loans usually are far more expensive than the amount of revenue they may initially produce.

Self-Dealing

Pronounced self-dealing practices are often present in serious problem institution situations and in banks which fail. Such practices with regard to loans are found in the form of overextensions of unsound credit to insiders, or their interests, who have improperly used their positions to obtain unjustified loans. Active officers, who serve at the pleasure of the ownership interests, are at times subjected to pressures which make it difficult to objectively evaluate such loans. Loans made for the benefit of ownership interests that are carried in the name of a seemingly unrelated party are sometimes used to conceal self-dealing loans.

Technical Incompetence

Technical incompetence usually is manifested in management's inability to obtain and evaluate credit information or put together a well-conceived loan package. Management weaknesses in this area are almost certain to lead to eventual loan losses. Problems can also develop when management, technically sound in some forms of lending, becomes involved in specialized types of credit in which it lacks expertise and experience.

Lack of Supervision

Loan problems encountered in this area normally arise for one of two reasons:

- Absence of effective active management supervision of loans which possessed reasonable soundness at inception. Ineffective supervision almost invariably results from lack of knowledge of a borrower's affairs over the life of the loan. It may well be coupled with one or more of the causes and sources of loan problems previously mentioned.
- Failure of the board and/or senior management to properly oversee subordinates to determine that sound policies are being carried out.

Lack of Attention to Changing Economic Conditions

Economic conditions, both national and local, are continuously changing, management must be responsive to these changes. This is not to suggest that lending policies should be in a constant state of flux, nor does it suggest that management should be able to forecast totally the results of economic changes. It does mean, however, that bankers should realistically evaluate lending policies and individual loans in light of changing conditions. Economic downturns can adversely affect borrowers' repayment potential and can lessen an institution's collateral protection. Reliance on previously existing conditions as well as optimistic hopes for economic improvement can, particularly when coupled with one or more of the causes and sources of loan problems previously mentioned, lead to serious loan portfolio deterioration.

Competition

Competition among financial institutions for growth, profitability, and community influence sometimes results in the compromise of sound credit principles and acquisition of unsound loans. The ultimate cost of unsound loans outweighs temporary gains in growth, income and influence.

Potential Problem Indicators by Document

The preceding discussions describe various practices or conditions which may serve as a source or cause of weak loans. Weak loans resulting from these practices or conditions may manifest themselves in a variety of ways. While it is impossible to provide a complete detailing of potential "trouble indicators", the following list, by document, may aid the examiner in identifying potential problem loans during the examination process.

- **Debt Instrument -** Delinquency; irregular payments or payments not in accordance with terms; unusual or frequently modified terms; numerous renewals with little or no principal reduction; renewals that include interest; and extremely high interest rate in relation to comparable loans granted by the institution or the going rate for such loans in the institution's market area.

- **Liability Ledger -** Depending on the type of debt, failure to amortize in a regular fashion over a reasonable period of time, e.g., on an annual basis, seasonally, etc.; and a large number of out-of-territory borrowers, particularly in cases where these types of loans have increased substantially since the previous examination.
- **Financial and Operating Statements -** Inadequate or declining working capital position; excessive volume or negative trend in receivables; unfavorable level or negative trend in inventory; no recent aging of receivables, or a marked slowing in receivables; drastic increase in volume of payables; repeated and increasing renewals of carry-over operating debt; unfavorable trends in sales and profits; rapidly expanding expenses; heavy debt-to-worth level and/or deterioration in this relationship; large dividend or other payments without adequate or reasonable earnings retention; and net worth enhancements resulting solely from reappraisal in the value of fixed assets.
- **Cash Flow Documentation -** Absence of cash flow statements or projections, particularly as related to newly established term borrowers; projections indicating an inability to meet required interest and principal payments; and statements reflecting that cash flow is being provided by the sale of fixed assets or nonrecurring situations.
- **Correspondence and Credit Files -** Missing and/or inadequate collateral or loan documentation, such as financial statements, security agreements, guarantees, assignments, hypothecation agreements, mortgages, appraisals, legal opinions and title insurance, property insurance, loan applications; evidence of borrower credit checks; corporate or partnership borrowing authorizations; letters indicating that a borrower has suffered financial difficulties or has been unable to meet established repayment programs; and documents that reveal other unfavorable factors relative to a line of credit.
- **Collateral -** Collateral evidencing a speculative loan purpose or collateral with inferior marketability characteristics (single purpose real estate, restricted stock, etc.) which has not been compensated for by other reliable repayment sources; and collateral of questionable value acquired subsequent to the extension of the credit.

SELECTING A LOAN REVIEW SAMPLE IN A RISK-FOCUSED EXAMINATION

Examiners are expected to select a sample of loans that is of sufficient size, scope, and variety to enable them to reach reliable conclusions about the aforementioned aspects of an institution’s overall lending function, and tailor the loan review sample based on an institution’s business model, complexity, risk profile, and lending activities. The review may include all sources of credit exposure arising from loans and leases, including guarantees, letters of credit, and other commitments.

Assessing the Risk Profile

Prior to developing the loan review sample, examiners are to assess the risk profile of the loan portfolio by reviewing the institution’s management reports and policies as well as agency available information. This includes evaluating concerns detailed in prior Reports of Examination (ROEs), issues detailed in the institution’s loan exception reports and internal loan reviews, and the historical accuracy of independent credit rating or grading systems. The Uniform Bank Performance Report provides information relative to loan mix and recent trends, such as concentrations of credit, rapid growth, and loan yields higher or lower than peer in different portfolio segments. Examiners are also to consider changes in local economic or market conditions that could affect the portfolio’s risk profile. Numerous economic tools and resources are available to examiners to assist in planning the loan review.

As part of the examination planning activities, examiners are to consider whether management has implemented any material changes in the institution’s business lines, loan products, lending policies, markets, or personnel since the prior examination. Additionally, examiners should consider whether activities conducted by a branch, subsidiary, affiliate, or third party partner warrant particular attention.

Examiners are to consider the historical adequacy of the institution’s policies and practices relative to credit underwriting, administration, and loan grading for each significant loan type. Examiners should review recent management reports and Board or committee packages before selecting a targeted sample to determine whether the Board of Directors and officers are receiving sufficient information to remain abreast of emerging trends and changes in the loan portfolio’s risk profile.

Selecting the Sample

The size and composition of the loan sample should be commensurate with the quantity of credit risk, the adequacy of risk management practices, and the institution's financial condition and business model. There are no established or expected levels of minimum or maximum coverage, or penetration, ratios for loan review samples. Rather, examiners should use judgment when determining the focus and extent of loan sampling. Ensuring that the appropriate types of loans are in the sample is more meaningful than how much of the overall portfolio is reviewed.

Examiners must make the most efficient use of resources, and should sample loans of sufficient size, scope and variety to enable them to form reliable conclusions about overall credit quality and the adequacy of credit risk management and governance. Examiners' understanding of the institution's business model, risk profile, complexity, external and internal reports, as well as discussions with management, will be highly instrumental in identifying loans to be included in a judgmental sample. Examiners may also leverage the institution's external and internal loan reviews when determining the loan sample. For example, examiners may want to exclude loans already covered in institution loan reviews or follow-up on loans identified as problems in the loan reviews.

If information gathered indicates weaknesses in underwriting or credit administration practices, or if the institution is engaging in lending activities with significant or increasing risk, the examiner should select a robust sample to fully assess the risk areas. Conversely, institutions with stable, well-managed loan functions exhibiting few signs of change should have more streamlined reviews, focusing more on newer originations and less on loans that were deemed of satisfactory quality at previous examinations that continue to perform as agreed. However, in all instances, examiners should sample enough credits, including new and various-sized credits, to assess the adequacy of asset quality, underwriting practices, and credit risk management, in order to support ROE findings and assigned ratings.

Nonhomogeneous Loan Sample

Nonhomogeneous loans include acquisition, development and construction, commercial real estate, commercial and industrial, and agricultural credits. The nonhomogeneous loan sample generally should include a sufficient number of loans to transaction test various segments of the loan portfolio, but it is unnecessary to review all loans in a particular segment. Rather, the loan review should encompass enough loans in each portfolio segment to support examination conclusions about credit quality and credit management practices relative to underwriting standards and credit administration.

In general, a sampling of loans in the following segments should be included in the overall loan review sample, as applicable to a particular institution:

- Adversely classified or listed for Special Mention in prior ROEs.
- Delinquent, nonaccrual, impaired, or renegotiated/restructured (particularly loans with multiple renewals).
- Internally adversely classified by the institution.
- Rated by the institution as a marginally acceptable credit.
- Subject to prior supervisory criticism or corrective actions.
- Upgraded or removed from internal adverse classification since the prior examination, to ensure that procedures for managing the watch list are appropriate.
- Insider loans (directors, officers, employees, principal shareholders, or related interests at any insured depository institution).
- Originated since the prior examination, including those in new or expanding product lines.
- Participations.
- Out of territory.
- Part of a significant credit concentration or growth area.
- Flagged for potential fraud.
- Contain outlier characteristics (e.g. higher risk loans, credits with policy exceptions).
- Originated by specific loan officers, particularly those with known concerns or weaknesses.
- In geographic areas exposed to changes in market conditions.
- Various sized loans (larger, mid-sized, and smaller loan amounts).

As part of a risk-focused and forward-looking approach to loan review, loans that had been reviewed at previous examinations that had sufficient performance, collateral and documentation, and continue to amortize as agreed, may be more appropriate for Discuss Only or not included at all, which would allow more resources to be focused on new originations or other loans not previously reviewed that would help evaluate areas of significant or growing risk.

Homogeneous Pool Sample

Assessing the quality of homogeneous retail consumer credit on a loan-by-loan basis is burdensome for both institutions and examiners due to portfolios generally consisting of a large number of loans with relatively low balances. Instead, examiners should assess the quality of retail consumer loans based on the borrowers' repayment performance. Examiners generally should review and classify retail consumer loans in accordance with the procedures discussed later in this section under the Interagency Retail Credit Classification Policy subheading.

The EIC may supplement the classification of retail loans with a direct review of larger consumer loans or by sampling various segments when the risk assessment supports doing so. Such an expansion may be warranted when homogeneous lending is a major business line of the institution or when examiners note rapid growth, new products, weaknesses in the loan review or audit program, weaknesses in management information systems, or other factors that raise concerns. The EIC also may conduct limited transaction testing to focus on specific risk characteristics, such as the underwriting standards for new loans or the revised terms granted in workouts or modifications.

Sampling for Trading and Derivatives Activities. At institutions that are active in such markets, examiners should include an assessment of credit exposures arising from matching loans with derivatives (generally swaps or forwards) to hedge a particular type of risk. For example, an institution can use a swap to contractually exchange a stream of floating-rate payments for a stream of fixed-rate payments to hedge interest rate risk. Such activities create a credit exposure relative to both the loan and the derivative. When warranted, examiners should review a sufficient number of loan relationships with these exposures to assess the institution's overall exposure and management's ability to prudently manage derivatives activities. Examiners also should review a sample of credit relationships established solely for the purpose of facilitating derivatives activities.

Determining the Depth of the Review

Examiners should assign loans to be reviewed into one of three groupings, "In Scope" (full review), "Discuss Only" (limited review), and, when applicable, "Group" (pooled loans).

In Scope. This sample consists of loans that warrant the most comprehensive level of review. Examiners are to review loan files to the extent needed to assess the risk in the credit, conformance to lending risk management policies and procedures, and compliance with applicable laws and regulations. Examiners should document the assessment of the borrower's repayment capacity, collateral protection, and overall risk to the institution on individual linesheets. Documentation should also note underwriting exceptions, administrative weaknesses, and apparent violations.

For institutions with stable, well-managed loan functions, In Scope loans should generally focus on newer originations and insider loans. In these situations, if certain loans from previous examinations are included In Scope, examiners have the ability to leverage documentation from previous reviews and focus on updates to the essential credit information.

Discuss Only. This sample is to consist of loans subject to a limited level of review, and examiners are to discuss these credits with institution management. Such discussions can be an effective method of confirming the adequacy of loan grading systems and credit administration practices, particularly when the In Scope sample indicates the institution has adequate risk management practices, and when the institution has a stable, well-managed loan function and exhibits few signs of change. Examiners should briefly document key issues raised during these discussions, but examiners do not need to complete full linesheets. When warranted, examiners may conduct a limited file review or assessment of specific work-out plans and performance metrics for these loans.

Credits should be reallocated from Discuss Only to In Scope if management disagrees with the classification, material concerns with credit underwriting or administration practices are identified, or the EIC or Asset Manager determines a more comprehensive review is warranted.

Group. This sample could include loans with similar risk characteristics that merit review on a pooled basis. Examiners generally should discuss or classify the loans not on an individual basis but as a pool, and apply the findings and conclusions to the entire Group. Examiners may use multiple Groups to focus on the adequacy of credit underwriting and administration practices or to address different risk attributes in stratified segments. The Group sample may be appropriate for specific categories of homogeneous retail consumer credit, such as automobile, credit card, or residential mortgage loans.

Adjusting Loan Review

The EIC has the flexibility, after communicating with the case manager and receiving concurrence of field management, to adjust the loan review sample at any point during the examination based on findings. The rationale for significant changes in the examination plan will be clearly communicated to institution management, along with any adjustments to the breadth or depth of procedures, personnel, and examination schedule.

Accepting an Institution's Internal Ratings

If the institution's internal grading system (watch list) is determined to be accurate and reliable, examiners can use the institution's data for preparing the applicable examination report pages and schedules, for determining the overall level of classifications, and for providing supporting comments regarding the quality of the loan portfolio.

Loan Penetration Ratio

The FDIC has not established any minimum or maximum loan penetration ratios.

The objectives for loan review on an examination include an analysis of credit quality through transaction testing and an assessment of credit administration practices. Achieving a specific loan penetration ratio is not to be the driving factor in determining the loan review sample. Rather, examiners should focus on reviewing a sufficient number of loans in various segments of the portfolio to assess overall risk in the portfolio and to support examination findings, and then calculate the resultant loan penetration ratio for informational purposes only and enter the ratio in the Summary Analysis of Examination Report.

Large Bank Loan Review

In addition to point-in-time examinations conducted at most community banks, the FDIC utilizes targeted loan reviews conducted under a supervisory plan, guiding a continuous examination program for certain institutions. These targeted programs are generally warranted to ensure effective monitoring and examination activity related to larger and more complex institutions. While the supervisory plan and continuous examination processes and procedures may differ in some respects from the point in time approach, the principles contained in the preceding loan review instructions are applicable to examination activities for all institutions supervised by the FDIC.

←

LOAN EVALUATION AND CLASSIFICATION

Loan Evaluation

To properly analyze any credit, an examiner must acquire certain fundamental information about a borrower's financial condition, purpose and terms of the borrowing, and prospects for its orderly repayment. The process involved in acquiring the foregoing information will necessarily vary with the type and sophistication of records utilized by the institution.

Review of Files and Records

Commercial loan liability ledgers or comparable subsidiary records vary greatly in quality and detail. Generally, they will provide the borrower's total commercial loan liability to the institution, and the postings thereto will depict a history of the debt. Collateral records should be scrutinized to acquire the necessary descriptive information and to ascertain that the collateral held to secure the notes is as transcribed.

Gathering credit information is an important process and should be done with care to obtain the essential information, which will enable the examiner to appraise the loans accurately and fairly. Failure to obtain and record pertinent information contained in the credit files can reflect unfavorably on examiners, and a good deal of examiner and loan officer time can be saved by carefully analyzing the files. Ideally, credit files will also contain important correspondence between the institution and the borrower. However, this is not universally the case; in some instances, important correspondence is deliberately lodged in separate files because of its sensitive character. Correspondence between the institution and the borrower can be especially valuable to the examiner in developing added insight into the status of problem credits.

Verification of loan proceeds is one of the most valuable and effective loan examining techniques available to the examiner and often one of the most ignored. This verification process can disclose fraudulent or fictitious notes, misapplication of funds, loans made for the benefit or accommodation of parties other than the borrower of record, or utilization of loans for purposes other than those reflected in the institution's files. Verification of the disbursement of a selected group of large or unusual loans, particularly those subject to classification or Special Mention and those granted under circumstances which appear illogical or incongruous is important. However, it is more important to carry the verification process one step further to the apparent utilization of loan proceeds as reflected by the customer's deposit account or other related institution records. The examiner should also determine the purpose of the credit and the expected source of repayment.

Examination Procedures regarding loan portfolio analysis are included in the ED Modules.

Additional Transaction Testing

Part of the assessment of loan administration practices includes transaction testing. Such testing can verify that the institution's written policies and practices are implemented as intended. Testing can also be useful in detecting potential fraudulent or irregular activity. In particular, examiners are required to verify a sample of loans that paid off during or just prior to the on-site portion of the examination. Such verification would include reviewing the loan file, payoff tickets, and tracing the source of funds for the payoff.

Loan Discussion

The examiner must comprehensively review all data collected on the individual loans. In most banks, this review should allow the majority of loans to be passed without criticism, eliminating the need for discussing these lines with the appropriate institution officer(s). No matter how thoroughly the supporting loan files have been reviewed, there will invariably be a number of loans which will require additional information or discussion before an appropriate judgment can be made as to their credit quality, relationship to other loans, proper documentation, or other circumstances related to the overall examination of the loan portfolio. Such loans require discussion with the appropriate institution officer(s) as do other loans for which adequate information has been assembled to indicate that classification or Special Mention is warranted.

Proper preparation for the loan discussion is essential, and the following points should be given due consideration by the examiner. Loans which have been narrowed down for discussion should be reviewed in depth to insure a comprehensive grasp of all factual material. Careful advance preparation can save time for all concerned. Particularly with regard to large, complicated lines, undue reliance should not be placed on memory to cover important points in loan discussion. Important weaknesses and salient points to be covered in discussion, questions to be asked, and information to be sought should be noted. The loan discussion should not involve discussion of trivialities since the banker's time is valuable, and it is no place for antagonistic remarks and snide comments directed at loan officers. The examiner should listen carefully to what the banker has to say, and concisely and accurately note this information. Failure to do so can result in inaccuracies and make follow-up at the next examination more difficult.

Loan Analysis

In the evaluation of individual loans, the examiner should weigh carefully the information obtained and arrive at a judgment as to the credit quality of the loans under review. Each loan is appraised on the basis of its own characteristics. Consideration is given to the risk involved in the project being financed; the nature and degree of collateral security; the character, capacity, financial responsibility, and record of the borrower; and the feasibility and probability of its orderly liquidation in accordance with specified terms. The willingness and ability of a debtor to perform as agreed remains the primary measure of a loan's risk. This implies that the borrower must have earnings or liquid assets sufficient to meet interest payments and provide for reduction or liquidation of principal as agreed at a reasonable and foreseeable date. However, it does not mean that borrowers must at all times be in a position to liquidate their loans, for that would defeat the original purpose of extending credit.

Following analysis of specific credits, it is important that the examiner ascertain whether troublesome loans result from inadequate lending and collection policies and practices or merely reflect exceptions to basically sound credit policies and practices. In instances where troublesome loans exist due to ineffective lending practices and/or inadequate supervision, it is quite possible that existing problems will go uncorrected and further loan quality deterioration may occur. Therefore, the examiner should not only identify problem loans, but also ascertain the cause(s) of these problems. Weaknesses in lending policies or practices should be stressed, along with possible corrective measures, in discussions with the institution's senior management and/or the directorate and in the Report of Examination.

Loan Classification

To quantify and communicate the results of the loan review, the examiner must arrive at a decision as to which loans are to be subjected to criticism and/or comment in the examination report. Adversely classified loans are allocated on the basis of risk to three categories: Substandard; Doubtful; and Loss.

Other loans of questionable quality, but involving insufficient risk to warrant classification, are designated as Special Mention loans. Loans lacking technical or legal support, whether or not adversely classified, should be brought to the attention of the institution's management. If the deficiencies in documentation are severe in scope or volume, a schedule of such loans should be included in the Report of Examination.

Loan classifications are expressions of different degrees of a common factor, risk of nonpayment. All loans involve some risk, but the degree varies greatly. It is incumbent upon examiners to avoid classification of sound loans. The practice of lending to sound businesses or individuals for reasonable periods is a legitimate banking function. Adverse classifications should be confined to those loans which are unsafe for the investment of depositors' funds.

If the internal grading system is determined to be accurate and reliable, examiners can use the institution's data for preparing the applicable examination report pages and schedules, for determining the overall level of classifications, and for providing supporting comments regarding the quality of the loan portfolio. If the internal classifications are overly conservative, examiners should make appropriate adjustments and include explanations in the report's comments.

The Uniform Agreement on the Classification and Appraisal of Securities Held by Depository Institutions was issued on October 29, 2013, by the Office of the Comptroller of the Currency, the FDIC, and the Federal Reserve Board. The attachment to this interagency statement provides definitions of Substandard, Doubtful, and Loss categories used for adversely classifying institution assets. Amounts classified Loss should be promptly eliminated from the institution's books.

Uniform guidelines have been established by the FDIC regarding the Report of Exam treatment of assets classified Doubtful. The general policy is not to require charge-off or similar action for Doubtful classifications. Examiners should make a statement calling for an institution to charge-off a portion of loans classified Doubtful only when State law or policy requires. Further, any such statement should be clear as to the intended purpose of bringing the institution into conformity with those State requirements. An exception is made for formal actions under Section 8 of the FDI Act.

A statement addressing the chargeoff of loans classified Loss is a required comment Report of Examination when the amount is material. Amounts classified Loss should be promptly eliminated from the institution's books.

Definitions

- **Substandard -** Substandard loans are inadequately protected by the current sound worth and paying capacity of the obligor or of the collateral pledged, if any. Loans so classified must have a well-defined weakness or weaknesses that jeopardize the liquidation of the debt. They are characterized by the distinct possibility that the institution will sustain some loss if the deficiencies are not corrected.
- **Doubtful -** Loans classified Doubtful have all the weaknesses inherent in those classified Substandard with the added characteristic that the weaknesses make collection or liquidation in full, on the basis of currently known facts, conditions, and values, highly questionable and improbable.
- **Loss -** Loans classified Loss are considered uncollectible and of such little value that their continuance as bankable assets is not warranted. This classification does not mean that the loan has absolutely no recovery or salvage value but rather it is not practical or desirable to defer writing off this basically worthless asset even though partial recovery may be effected in the future.

There is a close relationship between classifications, and no classification category should be viewed as more important than the other. The uncollectibility aspect of Doubtful and Loss classifications makes their segregation of obvious importance. The function of the Substandard classification is to indicate those loans which are unduly risky and, if unimproved, may be a future hazard.

A complete list of adversely classified loans is to be provided to management, either during or at the close of an examination.

Special Mention Assets

Definition - A Special Mention asset has potential weaknesses that deserve management's close attention. If left uncorrected, these potential weaknesses may result in deterioration of the repayment prospects for the asset or in the institution's credit position at some future date. Special Mention assets are not adversely classified and do not expose an institution to sufficient risk to warrant adverse classification.

Use of Special Mention - The Special Mention category is not to be used as a means of avoiding a clear decision to classify a loan or pass it without criticism. Neither should it include loans listed merely "for the record" when uncertainties and complexities, perhaps coupled with large size, create some reservations about the loan. If weaknesses or evidence of imprudent handling cannot be identified, inclusion of such loans in Special Mention is not justified.

Ordinarily, Special Mention credits have characteristics which corrective management action would remedy. Often weak origination and/or servicing policies are the cause for the Special Mention designation. Examiners should not misconstrue the fact that most Special Mention loans contain management correctable deficiencies to mean that loans involving merely technical exceptions belong in this category. However, instances may be encountered where technical exceptions are a factor in scheduling loans for Special Mention.

Careful identification of loans which properly belong in this category is important in determining the extent of risk in the loan portfolio and providing constructive criticism for institution management. While Special Mention Assets should not be combined with adversely classified assets, their total should be considered in the analysis of asset quality and management, as appropriate.

The nature of this category precludes inclusion of smaller lines of credit unless those loans are part of a large grouping listed for related reasons. Comments on loans listed for Special Mention in the Report of Examination should be drafted in a fashion similar to those for adversely classified loans. There is no less of a requirement upon the examiner to record clearly the reasons why the loan is listed. The major thrust of the comments should be towards achieving correction of the deficiencies identified.

Troubled Commercial Real Estate Loan Classification Guidelines

Additional classification guidelines have been developed to aid the examiner in classifying troubled commercial real estate loans. These guidelines are intended to supplement the uniform guidelines discussed above. After performing an analysis and evaluation of the project, the examiner must determine the classification of any exposure.

The following guidelines are to be applied in instances where the obligor is devoid of other reliable means of repayment, with support of the debt provided solely by the project. If other types of collateral or other sources of repayment exist, the project should be evaluated in light of these mitigating factors.

- **Substandard -** Any such troubled real estate loan or portion thereof should be classified Substandard when well-defined weaknesses are present which jeopardize the orderly liquidation of the debt. Well-defined weaknesses include a project's lack of marketability, inadequate cash flow or collateral support, failure to complete construction on time or the project's failure to fulfill economic expectations. They are characterized by the distinct possibility that the institution will sustain some loss if the deficiencies are not corrected.
- **Doubtful -** Doubtful classifications have all the weaknesses inherent in those classified Substandard with the added characteristic that the weaknesses make collection or liquidation in full, on the basis of currently known facts, conditions and values, highly questionable and improbable. A Doubtful classification may be appropriate in cases where significant risk exposures are perceived, but Loss cannot be determined because of specific reasonable pending factors which may strengthen the credit in the near term. Examiners should attempt to identify Loss in the credit where possible thereby limiting the excessive use of the Doubtful classification.
- **Loss -** Advances in excess of calculated current fair value which are considered uncollectible and do not warrant continuance as bankable assets. There is little or no prospect for near term improvement and no realistic strengthening action of significance pending.

Technical Exceptions

Deficiencies in documentation of loans should be brought to the attention of management for remedial action. Failure of management to effect corrections may lead to the development of greater credit risk in the future. Moreover, an excessive number of technical exceptions may be a reflection on management's quality and ability. Inclusion of the schedule "Assets With Credit Data or Collateral Documentation Exceptions" and various comments in the Report of Examination is appropriate in certain circumstances. Refer to the Report of Examination Instructions for further guidance.

Past Due and Nonaccrual

Overdue loans are not necessarily subject to adverse criticism. Nevertheless, a high volume of overdue loans almost always indicates liberal credit standards, weak servicing practices, or both. Because loan renewal and extension policies vary among banks, comparison of their delinquency ratios may be misleading. A more significant method of evaluating this factor lies in determination of the trend within the institution under examination, keeping in mind the distortion resulting from seasonal influences, economic conditions, or the timing of examinations. It is important for the examiner to carefully consider the makeup and reasons for the volume of overdue loans. Only then can it be determined whether the volume of past due paper is a significant factor reflecting adversely on the quality or soundness of the overall loan portfolio or the efficiency and quality of management. It is important that overdue loans be computed on a uniform basis. This allows for comparison of overdue totals between examinations and/or with other banks.

The Report of Examination includes information on overdue and nonaccrual loans. Loans which are still accruing interest but are past their maturity or on which either interest or principal is due and unpaid (including unplanned overdrafts) are separated by loan type into two distinct groupings: 30 to 89 days past due and 90 days or more past due. Nonaccrual loans may include both current and past due loans. In the case of installment credit, a loan will not be considered overdue until at least two monthly payments are delinquent. The same will apply to real estate mortgage loans, term loans or any other loans payable on regular monthly installments of principal and interest.

Some modification of the overdue criteria may be necessary because of applicable State law, joint examinations, or unusual circumstances surrounding certain kinds of loans or in individual loan situations. It will always be necessary for the examiner to ascertain the institution's renewal and extension policies and procedures for collecting interest prior to determining which loans are overdue, since such practices often vary considerably from institution to institution. This is important not only to validate which loans are actually overdue, but also to evaluate the soundness of such policies. Standards for renewal should be aimed at achieving an orderly liquidation of loans and not at maintaining a low ratio of past due paper through unwarranted extensions or renewals.

In larger departmentalized banks or banks with large branch systems, it may be informative to analyze delinquencies by determining the source of overdue loans by department or branch. This is particularly true if a large volume of overdue loans exist. The production of schedules delineating overdue loans by department or branch is encouraged if it will aid in pinpointing the source of a problem or be otherwise informative.

Continuing to accrue income on assets which are in default as to principal and interest overstates an institution's assets, earnings, and capital. Call Report Instructions indicate that where the period of default of principal or interest equals or exceeds 90 days, the accruing of income should be discontinued unless the asset is well-secured and in process of collection. A debt is well-secured if collateralized by liens on or pledges of real or personal property, including securities that have a realizable value sufficient to discharge the debt in full; or by the guarantee of a financially responsible party. A debt is in process of collection if collection is proceeding in due course either through legal action, including judgment enforcement procedures, or, in appropriate circumstances, through collection efforts not involving legal action which are reasonably expected to result in repayment of the debt or its restoration to a current status. Institutions are strongly encouraged to follow this guideline not only for reporting purposes but also bookkeeping purposes. There are several exceptions, modifications and clarifications to this general standard. First, consumer loans and real estate loans secured by one-to-four family residential properties are exempt from the nonaccrual guidelines. Nonetheless, these exempt loans should be subject to other alternative methods of evaluation to assure the institution's net income is not materially overstated. Second, any State statute, regulation or rule which imposes more stringent standards for nonaccrual of interest should take precedence over these instructions. Third, reversal of previously accrued but uncollected interest applicable to any asset placed in a nonaccrual status, and treatment of subsequent payments as either principal or interest, should be handled in accordance with generally accepted accounting principles. Acceptable accounting treatment includes reversal of all previously accrued but uncollected interest against appropriate income and balance sheet accounts.

Nonaccrual Loans That Have Demonstrated Sustained Contractual Performance

The following information applies to borrowers who have resumed paying the full amount of scheduled contractual interest and principal payments on loans that are past due and in nonaccrual status. Although a prior arrearage may not have been eliminated by payments from a borrower, the borrower may have demonstrated sustained performance over a period of time in accordance with the contractual terms. Such loans to be returned to accrual status, even though the loans have not been brought fully current, provided two criteria are met:

- All principal and interest amounts contractually due (including arrearage) are reasonably assured of repayment within a reasonable period, and
- There is a sustained period of repayment performance (generally a minimum of six months) by the borrower, in accordance with the contractual terms involving payments of cash or cash equivalents.

When the regulatory reporting criteria for restoration to accrual status are met, previous charge-offs taken would not have to be fully recovered before such loans are returned to accrual status. Loans that meet the above criteria would continue to be disclosed as past due, as appropriate, until they have been brought fully current.

Troubled Debt Restructuring - Multiple Note Structure

The basic example of a trouble debt restructuring (TDR) multiple note structure is a troubled loan that is restructured into two notes where the first or "A" note represents the portion of the original loan principal amount which is expected to be fully collected along with contractual interest. The second part of the restructured loan, or "B" note, represents the portion of the original loan that has been charged-off.

Such TDRs generally may take any of three forms. In certain TDRs, the "B" note may be a contingent receivable that is payable only if certain conditions are met (e.g., sufficient cash flow from property). For other TDRs, the "B" note may be contingently forgiven (e.g., note "B" is forgiven if note "A" is paid in full). In other instances, an institution would have granted a concession (e.g., rate reduction) to the troubled borrower, but the "B" note would remain a contractual obligation of the borrower. Because the "B" note is not reflected as an asset on the institution's books and is unlikely to be collected, for reporting purposes the "B" note could be viewed as a contingent receivable.

Institutions may return the "A" note to accrual status provided the following conditions are met:

- The restructuring qualifies as a TDR as defined by ASC Subtopic 310-40*, Receivables – Troubled Debt Restructurings by Creditors* and there is economic substance to the restructuring.
- The portion of the original loan represented by the "B" note has been charged-off. The charge-off must be supported by a current, well-documented credit evaluation of the borrower's financial condition and prospects for repayment under the revised terms. The charge-off must be recorded before or at the time of the restructuring.
- The "A" note is reasonably assured of repayment and of performance in accordance with the modified terms.
- In general, the borrower must have demonstrated sustained repayment performance (either immediately before or after the restructuring) in accordance with the modified terms for a reasonable period prior to the date on which the "A" note is returned to accrual status. A sustained period of payment performance generally would be a minimum of six months and involve payments in the form of cash or cash equivalents.

Under existing reporting requirements, the "A" note would be disclosed as a TDR. In accordance with these requirements, if the "A" note yields a market rate of interest and performs in accordance with the restructured terms, such disclosures could be eliminated in the year following restructuring. To be considered a market rate of interest, the interest rate on the "A" note at the time of restructuring must be equal to or greater than the rate that the institution is willing to accept for a new receivable with comparable risk.

Interagency Retail Credit Classification Policy

The quality of consumer credit soundness is best indicated by the repayment performance demonstrated by the borrower. Because retail credit generally is comprised of a large number of relatively small balance loans, evaluating the quality of the retail credit portfolio on a loan-by-loan basis is burdensome for the institution being examined and examiners. To promote an efficient and consistent credit risk evaluation, the FDIC, the Comptroller of Currency, the Federal Reserve and the former Office of Thrift Supervision adopted the Uniform Retail Credit Classification and Account Management Policy (Retail Classification Policy.)

Retail credit includes open-end and closed-end credit extended to individuals for household, family, and other personal expenditures. It includes consumer loans and credit cards. For purposes of the policy, retail credit also includes loans to individuals secured by their personal residence, including home equity and home improvement loans.

In general, retail credit should be classified based on the following criteria:

- Open-end and closed-end retail loans past due 90 cumulative days from the contractual due date should be classified Substandard.
- Closed-end retail loans that become past due 120 cumulative days and open-end retail loans that become past due 180 cumulative days from the contractual due date should be charged-off. The charge-off should be taken by the end of the month in which the 120-or 180-day time period elapses.
- Unless the institution can clearly demonstrate and document that repayment on accounts in bankruptcy is likely to occur, accounts in bankruptcy should be charged off within 60 days of receipt of notification of filing from the bankruptcy court or within the delinquency time frames specified in this classification policy, whichever is shorter. The charge-off should be taken by the end of the month in which the applicable time period elapses. Any loan balance not charged-off should be classified Substandard until the borrower re-establishes the ability and willingness to repay (with demonstrated payment performance for six months at a minimum) or there is a receipt of proceeds from liquidation of collateral.
- Fraudulent loans should be charged off within 90 days of discovery or within the delinquency time frames specified in this classification policy, whichever is

shorter. The charge-off should be taken by the end of the month in which the applicable time period elapses.

- Loans of deceased persons should be charged off when the loss is determined or within the delinquency time frames adopted in this classification policy, whichever is shorter. The charge-off should be taken by the end of the month in which the applicable time period elapses.
- One-to-four family residential real estate loans and home equity loans that are delinquent 90 days or more with loan-to-value ratios greater than 60 percent, should be classified Substandard.

When an open- or closed-end residential or home equity loan is 180 days past due, a current assessment of value should be made and any outstanding loan balance in excess of the fair value of the property, less cost to sell, should be classified Loss.

Properly secured residential real estate loans with loan-to-value ratios equal to or less than 60 percent are generally not classified based solely on delinquency status. Home equity loans to the same borrower at the same institution as the senior mortgage loan with a combined loan-to-value ratio equal to or less than 60 percent should not be classified. However, home equity loans where the institution does not hold the senior mortgage, that are delinquent 90 days or more should be classified Substandard, even if the loan-to-value ratio is equal to, or less than, 60 percent.

If an institution can clearly document that the delinquent loan is well secured and in the process of collection, such that collection will occur regardless of delinquency status, then the loan need not be classified. A well secured loan is collateralized by a perfected security interest in, or pledges of, real or personal property, including securities, with an estimated fair value, less cost to sell, sufficient to recover the recorded investment in the loan, as well as a reasonable return on that amount. In the process of collection means that either a collection effort or legal action is proceeding and is reasonably expected to result in recovery of the loan balance or its restoration to a current status, generally within the next 90 days.

This policy does not preclude an institution from adopting an internal classification policy more conservative than the one detailed above. It also does not preclude a regulatory agency from using the Doubtful or Loss classification in certain situations if a rating more severe than Substandard is justified. Loss in retail credit should be recognized when the institution becomes aware of the loss, but in no case should the charge-off exceed the time frames stated in this policy.

Re-aging, Extensions, Deferrals, Renewals, or Rewrites

Re-aging is the practice of bringing a delinquent account current after the borrower has demonstrated a renewed willingness and ability to repay the loan by making some, but not all, past due payments. Re-aging of open-end accounts, or extensions, deferrals, renewals, or rewrites of closed-end accounts should only be used to help borrowers overcome temporary financial difficulties, such as loss of job, medical emergency, or change in family circumstances like loss of a family member. A permissive policy on re-agings, extensions, deferrals, renewals, or rewrites can cloud the true performance and delinquency status of the portfolio. However, prudent use of a policy is acceptable when it is based on recent, satisfactory performance and the true improvement in a borrower's other credit factors, and when it is structured in accordance with internal policies.

The decision to re-age a loan, like any other modification of contractual terms, should be supported in the institution's management information systems. Adequate management information systems usually identify and document any loan that is extended, deferred, renewed, or rewritten, including the number of times such action has been taken. Documentation normally shows that institution personnel communicated with the borrower, the borrower agreed to pay the loan in full, and the borrower shows the ability to repay the loan.

Institutions that re-age open-end accounts should establish a reasonable written policy and adhere to it. An account eligible for re-aging, extension, deferral, renewal, or rewrite should exhibit the following:

- The borrower should show a renewed willingness and ability to repay the loan.
- The account should exist for at least nine months before allowing a re-aging, extension, renewal, referral, or rewrite.
- The borrower should make at least three minimum consecutive monthly payments or the equivalent lump sum payment before an account is re-aged. Funds may not be advanced by the institution for this purpose.
- No loan should be re-aged, extended, deferred, renewed, or rewritten more than once within any twelve-month period; that is, at least twelve months must have elapsed since a prior re-aging. In addition, no loan should be re-aged, extended, deferred, renewed, or rewritten more than two times within any five-year period.
- For open-end credit, an over limit account may be re-aged at its outstanding balance (including the over limit balance, interest, and fees). No new credit may

be extended to the borrower until the balance falls below the designated predelinquency credit limit.

Partial Payments on Open-End and Closed-End Credit

Institutions should use one of two methods to recognize partial payments. A payment equivalent to 90 percent or more of the contractual payment may be considered a full payment in computing delinquency. Alternatively, the institution may aggregate payments and give credit for any partial payment received. For example, if a regular installment payment is $300 and the borrower makes payments of only $150 per month for a six-month period, the loan would be $900, or three full months delinquent. An institution may use either or both methods in its portfolio, but may not use both methods simultaneously with a single loan.

Examination Considerations

Examiners should determine whether institutions' policies and practices consider the Retail Classification Policy, understanding that there may be instances that warrant exceptions to the general classification policy. Loans need not be classified if the institution can document clearly that repayment will occur regardless of delinquency status. Examples might include loans well secured by marketable collateral and in the process of collection, loans for which claims are filed against solvent estates, and loans supported by valid insurance claims. Conversely, the Retail Classification Policy does not preclude examiners from reviewing and classifying individual large dollar retail credit loans that exhibit signs of credit weakness regardless of delinquency status.

In addition to reviewing loan classifications, the examiner should review the ALLL to assess whether it is at an appropriate level. Sound risk and account management systems typically include:

- Prudent retail credit lending policies,
- Measures to monitor adherence to policy,
- Detailed operating procedures, and
- Appropriate internal controls.

Institutions lacking sound policies or failing to implement or effectively follow established policies will be subject to criticism.

Examination Treatment

Use of the formula classification approach can result in numerous small dollar adversely classified items. Although these classification details are not always included in the Report of Examination, an itemized list is to be left with management. A copy of the listing should also be retained in the examination work papers.

Examiner support packages are available which have built in parameters of the formula classification policy, and which generate a listing of delinquent consumer loans to be classified in accordance with the policy. Use of this package may expedite the examination in certain cases, especially in larger banks.

Losses are one of the costs of doing business in consumer installment credit departments. It is important for the examiner to give consideration to the amount and severity of installment loan charge-offs when examining the department. Excessive loan losses are the product of weak lending and collection policies and therefore provide a good indication of the soundness of the consumer installment loan operation. The examiner should be alert also to the absence of installment loan charge-offs, which may indicate that losses are being deferred or concealed through unwarranted rewrites or extensions.

Dealer lines should be scheduled in the report under the dealer's name regardless of whether the contracts are accepted with or without recourse. Any classification or totaling of the nonrecourse line can be separately identified from the direct or indirect liability of the dealer. Comments and format for scheduling the indirect contracts will be essentially the same as for direct paper. If there is direct debt, comments will necessarily have to be more extensive and probably will help form a basis for the indirect classification.

No general rule can be established as to the proper application of dealers' reserves to the examiner's classifications. Such a rule would be impractical because of the many methods used by banks in setting up such reserves and the various dealer agreements utilized. Generally, where the institution is handling a dealer who is not financially responsible, weak contracts warrant classification irrespective of any balance in the dealer's reserve. Fair and reasonable judgment on the part of the examiner will determine application of dealer reserves.

If the amount involved would have a material impact on capital, consumer loans should be classified net of unearned income. Large business-type loans placed in consumer installment loan departments should receive individual review and, in all cases, the applicable unearned income discount should be deducted when such loans are classified.

Impaired Loans, Troubled Debt Restructurings, Foreclosures, and Repossessions

Loan Impairment – The accounting standard for impaired loans is ASC Subtopic 310-10. A loan is impaired when, based on current information and events, it is probable that an institution will be unable to collect all amounts due according to the contractual terms of the loan agreement (i.e., principal and interest). Impaired loans encompass all loans that are restructured in a troubled debt restructuring, including smaller balance homogenous loans that are typically exempt from ASC Subtopic 310-10. However, the standard does not include loans that are measured at fair value or the lower of cost or fair value.

When a loan is impaired under ASC Subtopic 310-10, the amount of impairment should be measured based on the present value of expected future cash flows discounted at the loan's effective interest rate (i.e., the contractual interest rate adjusted for any net deferred loan fees or costs and premium or discount existing at the origination or acquisition of the loan). As a practical expedient, impairment may also be measured based on a loan's observable market price. The fair value of the collateral must be used if the loan is collateral dependent. An impaired loan is collateral dependent if repayment would be expected to be provided solely by the sale or continued operation of the underlying collateral.

If the measure of a loan calculated in accordance with ASC Subtopic 310-10 is less than the recorded investment in the loan (typically the face amount of the loan, plus accrued interest, adjusted for any premium or discount, deferred fee or cost, less any charge-offs), impairment on that loan should be recognized as a part of the ALLL. In general, when the amount of the recorded investment in the loan exceeds the amount calculated under ASC Subtopic 310-10 and that amount is determined to be uncollectible, this excess amount should be promptly charged-off against the ALLL. In all cases, when an impaired loan is collateral dependent and the repayment of the loan is expected from the sale of the collateral, any portion of the recorded investment in the loan in excess of the fair value less cost to sell of the collateral should be charged-off.

Troubled Debt Restructuring - The accounting for TDRs is set forth in ASC Subtopic 310-40, *Receivables-Troubled Debt Restructurings by Creditors*. A restructuring constitutes a troubled debt restructuring if the institution for economic or legal reasons related to the borrower's financial difficulties grants a concession to the borrower that it would not otherwise consider. A troubled debt restructuring takes place when an institution grants a concession to a debtor in financial difficulty. Examiners are expected to reflect all TDRs in examination reports in accordance with this accounting guidance and institutions are expected to follow these principles when filing the Call Report.

TDRs may be divided into two broad groups: those where the borrower transfers assets to the creditor in full or partial satisfaction of the debt, which would include foreclosures; and those in which the terms of a debtor's obligation are modified, which may include reduction in the stated interest rate to an interest rate that is less than the current market rate for new obligations with similar risk, extension of the maturity date, or forgiveness of principal or interest. A third type of restructuring combines a receipt of assets and a modification of loan terms. A loan extended or renewed at an interest rate equal to the current market interest rate for new debt with similar risk is not reported as a restructured loan for examination purposes.

Transfer of Assets to the Creditor - An institution that receives assets (except long-lived assets that will be sold) from a borrower in full satisfaction of the recorded investment in the loan should record those assets at fair value. If the fair value of the assets received is less than the institution's recorded investment in the loan, a loss is charged to the ALLL. When property is received in full satisfaction of an asset other than a loan (e.g., a debt security), the loss should be reflected in a manner consistent with the balance sheet classification of the asset satisfied. When long-lived assets that will be sold, such as real estate, are received in full satisfaction of a loan, the real estate is recorded at its fair value less cost to sell. This fair value (less cost to sell) becomes the "cost" of the foreclosed asset.

To illustrate, assume an institution forecloses on a defaulted mortgage loan of $100,000 and takes title to the property. If the fair value of the property at the time of foreclosure is $90,000 and costs to sell are estimated at $10,000, a $20,000 loss should be immediately recognized by a charge to the ALLL. The cost of the foreclosed asset becomes $80,000. If the institution is on an accrual basis of accounting, there may also be adjusting entries necessary to reduce both the accrued interest receivable and loan interest income accounts. Assume further that in order to effect sale of the realty to a third party, the institution is willing to offer a new mortgage loan (e.g., of $100,000) at a concessionary rate of interest (e.g., 10 percent while the market interest rate for new loans with similar risk is 20 percent). Before booking this new transaction, the institution must establish its "economic value" or what would be the cash price paid. Pursuant to ASC Subtopic 835-30, *Interest – Imputation of Interest*, the value is represented by the sum of the present value of the income stream to be received from the new loan, discounted at the current market interest rate for this type of credit, and the present value of the principal to be received, also discounted at the current market interest rate. This economic value (calculated by discounting the cash flows at the current market interest rate) becomes the proper carrying value for the property at its sale date. Since the sales price of $78,000 is less than the property's carrying amount of $80,000), an additional loss has been incurred and should be immediately recognized. This additional loss should be reflected in the allowance if a relatively brief period has elapsed between foreclosure and subsequent resale of the property. However, the loss should be treated as loss on the sale of real estate if the asset has been held for a longer period. The new loan would be placed on the books at its face value ($100,000) and the difference between the new loan amount and the "economic value" ($78,000) is treated as unearned discount ($22,000). For examination and Call Report purposes, the asset would be shown net of the unearned discount which is reduced periodically as it is earned over the life of the new loan. The $22,000 discount is accreted into interest income over the life of the loan as long as the loan remains in accrual status.

The basis for this accounting approach is the assumption that financing the resale of the property at a concessionary rate exacts an opportunity cost which the institution must recognize. That is, unearned discount represents the present value of the "imputed" interest differential between the concessionary and market rates of interest. Present value accounting also assumes that both the institution and the third party who purchased the property are indifferent to a cash sales price at the "economic value" or a higher financed price repayable over time.

Modification of Terms - When the terms of a TDR provide for a reduction of interest or principal, the institution should measure any loss on the restructuring in accordance with the guidance for impaired loans as set forth in ASC Subtopic 310-10 unless the loans are measured at fair value or the lower of cost or fair value. The amount of impairment of the restructured loan using the appropriate measurement method in ASC Subtopic 310-10 is reported as a component in determining the overall ALLL If any amount of the calculated impairment is determined to be uncollectible, that amount should be promptly charged-off against the ALLL.

For example, in lieu of foreclosure, an institution chooses to restructure a $100,000 loan to a borrower which had originally been granted with an interest rate of 10 percent for 10 years. The institution and the borrower have agreed to capitalize the accrued interest ($10,000) into the note balance, but the restructured terms will permit the borrower to repay the debt over 10 years at a six percent interest rate. The institution does not believe the loan is collateral dependent. In this situation, the institution would determine the amount of impairment on the TDR as the difference between the present value of the expected cash flows discounted at the 10 percent rate specified in the original contract and the recorded investment in loan of $110,000. This amount of the calculated impairment becomes a component of the overall ALLL.

Combination Approach - In some instances, the institution may receive assets in partial rather than full satisfaction of a loan or security and may also agree to alter the original repayment terms. In these cases, the recorded investment in the loan should be reduced by the fair value of the assets received (less cost to sell, if appropriate). The remaining recorded investment in the loan is accounted for as a TDR.

Examination Report Treatment - Examiners should continue to classify TDRs, including any impaired collateral dependent loans, based on the definitions of Loss, Doubtful, and Substandard. When an impaired loan is collateral dependent and the loan is expected to be satisfied by the sale of the collateral, any portion of the recorded investment in the loan which exceeds the fair value of the collateral, less cost to sell is the amount of impairment included in the ALLL. This is the amount of Loss on that loan that should be promptly charged-off. For other loans that are impaired loans, the amount of the recorded investment in the loan over the amount of the calculated impairment is recognized as a component of the ALLL. However, when available information confirms that loans and leases (including any recorded accrued interest, net deferred loan fees or costs, and unamortized premium or discount) other than impaired collateral dependent loans (dependent on the sale of the collateral), or portions thereof, are uncollectible, these amounts should be promptly charged-off against the ALLL.

An examiner should not require an additional allowance for credit losses of impaired loans over and above what is calculated in accordance with these standards. An additional allowance on impaired loans may be supported based on consideration of institution-specific factors, such as historical loss experience compared with estimates of such losses and concerns about the reliability of cash flow estimates, the quality of an institution's loan review function, and controls over its process for estimating its ASC Subtopic 310-10 allowance.

Other Considerations - Examiners may encounter situations where impaired loans and TDRs are identified, but the institution has not properly accounted for the transactions. Where incorrect accounting treatment resulted in an overstatement of earnings, capital and assets, it will be necessary to determine the proper carrying values for these assets, utilizing the best available information developed by the examiner after consultation with institution management. Nonetheless, proper accounting for impaired loans and TDRs is the responsibility of institution management. Examiners should not spend a disproportionate amount of time developing the appropriate accounting entries, but instead discuss with and require corrective action by institution management when the institution's treatment is not in accordance with accepted accounting guidelines. It must also be emphasized that collectibility and proper accounting and reporting are separate matters; restructuring a borrower's debt does not ensure collection of the loan or security. As with all other assets, adverse classification should be assigned if analysis indicates there is risk of loss present. Examiners should take care, however, not to discourage or be critical of institution management's legitimate and reasonable attempts to achieve debt settlements through concessionary terms. In many cases, restructurings offer the only realistic means for an institution to bring about collection of weak or nonearning assets. Finally, the volume of impaired loans and restructured debts having concessionary interest rates should be considered when evaluating the institution's earnings performance and assigning the earnings performance rating.

Examination procedures for reviewing TDRs are included in the ED Modules.

Report of Examination Treatment of Classified Loans

The Items Subject to Adverse Classification page allows an examiner to present pertinent and readily understandable comments related to loans which are adversely classified. In addition, the Analysis of Loans Subject to Adverse Classification page permits analysis of present and previous classifications from the standpoint of source and disposition. These loan schedules should be prepared in accordance with the Report of Examination Instructions.

An examiner must present, in writing, relevant and readily understandable comments related to criticized loans. Therefore, a thorough understanding of all factors surrounding the loan is required and only those germane to description, collectibility, and management plans should be included in the comments. Comments should be concise, but brevity is not to be accomplished by omission of appropriate information. Comments should be informative and factual data emphasized. The important weaknesses of the loan should not be overshadowed by extraneous information which might well have been omitted. An ineffective presentation of a classified loan weakens the value of a Report of Examination and frequently casts doubt on the accuracy of the classifications. The essential test of loan comments is whether they justify the classification.

Careful organization is an important ingredient of good loan comments. Generally, loan comments should include the following items:

- **Identification -** Indicate the name and occupation or type of business of the borrower. Cosigners, endorsers and guarantors should be identified and in the case of business loans, it should be clear whether the borrower is a corporation, partnership, or sole proprietorship.
- **Description -** The make-up of the debt should be concisely described as to type of loan, amount, origin and terms. The history, purpose, and source of repayment should also be indicated.
- **Collateral -** Describe and evaluate any collateral, indicating the marketability and/or condition thereof. If values are estimated, note the source.
- **Financial Data -** Current balance sheet information along with operating figures should be presented, if such data are considered necessary. The examiner must exercise judgment as to whether a statement should be detailed in its entirety. When the statement is relevant to the classification, it is generally more effective to summarize weaknesses with the entire statement presented. On the other hand, if the statement does not significantly support or detract from the loan, a very brief summarization of the statement is in order.
- **Summarize the Problem -** The examiner's comments should explicitly point out reasons for the classification. Where portions of the line are accorded different classifications or are not subject to classification, comments should clearly set forth the reasoning for the split treatment.
- **Management's Intentions -** Comments should include any corrective program contemplated by management.

Examiners should avoid arbitrary or penalty classifications, nor should "conceded" or "agreed" be given as the principal reason for adverse classifications. Management's opinions and ideas should not have to be emphasized; if a classification is well-founded, the facts will speak for themselves. If well-written, there is little need for long summary comments reemphasizing major points of the loan write-up.

When the volume of loan classifications reaches the point of causing supervisory concern, analysis of present and previous classifications from the standpoint of source and disposition becomes very important. For this reason, the

Analysis of Loans Subject to Adverse Classification page should be completed in banks possessing characteristics which present special supervisory problems; when the volume or composition of adversely classified loans has changed significantly since the previous examination, including both upward and downward movements; and, in such other special or unusual situations as examiners deem appropriate. Generally, the page should not include consumer loans and overdrafts and it should be footnoted to indicate that these assets are not included.

Issuance of "Express Determination" Letters to Institutions for Federal Income Tax Purposes

Tax Rules - The Internal Revenue Code and tax regulations allow a deduction for a loan that becomes wholly or partially worthless. All pertinent evidence is taken into account in determining worthlessness. Special tax rules permit a federally supervised depository institution to elect a method of accounting under which it conforms its tax accounting for bad debts to its regulatory accounting for loan charge-offs, provided certain conditions are satisfied. Under these rules, loans that are charged-off pursuant to specific orders of the institution's supervisory authority or that are classified by the institution as Loss assets under applicable regulatory standards are conclusively presumed to have become worthless in the taxable year of the charge-offs.

To be eligible for this accounting method for tax purposes, an institution must file a conformity election with its Federal income tax return. The tax regulations also require the institution's primary Federal supervisory authority to expressly determine that the institution maintains and applies loan loss classification standards that are consistent with the regulatory standards of its supervisory authority.

An institution must request an "express determination" letter before making the election. To continue using the tax-book conformity method, the institution must request a new letter at each subsequent examination that covers the loan review process. If the examiner does not issue an "express determination" letter at the end of such an examination, the institution's election of the tax-book conformity method is revoked automatically as of the beginning of the taxable year that includes the date of examination. However, that examiner's decision not to issue an "express determination" letter does not invalidate an institution's election for any prior years. The supervisory authority is not required to rescind any previously issued "express determination" letters.

When an examiner does not issue an "express determination" letter, the institution is still allowed tax deductions for loans that are wholly or partially worthless. However, the burden of proof is placed on the institution to support its tax deductions for loan charge-offs.

Examination Guidelines - Institutions are responsible for requesting "express determination" letters during examinations that cover their loan review process, i.e., during safety and soundness examinations. Examiners should not alter the scope or frequency of examinations merely to permit banks to use the tax-book conformity method.

When requested by an institution that has made or intends to make the election under Section 1.166-2(d)(3) of the tax regulations, the examiner-in-charge should issue an "express determination" letter, provided the institution does maintain and apply loan loss classification standards that are consistent with the FDIC's regulatory standards. The letter should only be issued at the completion of a safety and soundness examination at which the examiner-in-charge has concluded that the issuance of the letter is appropriate.

An "express determination" letter should be issued to an institution only if:

- The examination indicates that the institution maintains and applies loan loss classification standards that are consistent with the FDIC's standards regarding the identification and charge-off of such loans; and
- There are no material deviations from the FDIC's standards.

Minor criticisms of the institution's loan review process as it relates to loan charge-offs or immaterial individual deviations from the FDIC's standards should not preclude the issuance of an "express determination" letter.

An "express determination" letter should not be issued if:

- The institution's loan review process relating to charge-offs is subject to significant criticism;
- Loan charge-offs reported in the Report of Condition and Income (Call Reports) are consistently overstated or understated; or
- There is a pattern of loan charge-offs not being recognized in the appropriate year.

When the issuance of an "express determination" letter is appropriate, it should be prepared on FDIC letterhead using the following format. The letter should be signed and dated by the examiner-in-charge and provided to the institution for its files. The letter is not part of the Report of Examination.

Express Determination Letter for IRS Regulation 1.166-2(d)(3)

“In connection with the most recent examination of [Name of Bank], by the Federal Deposit Insurance Corporation, as of [examination date], we reviewed the institution’s loan review process as it relates to loan charge-offs. Based on our review, we concluded that the institution, as of that date, maintained and applied loan loss classification standards that were consistent with regulatory standards regarding loan charge-offs.

This statement is made on the basis of a review that was conducted in accordance with our normal examination procedures and criteria. It does not in any way limit or preclude any formal or informal supervisory action (including enforcement actions) by this supervisory authority relating to the institution’s loan review process or the level at which it maintains its allowance for loan and lease losses.

[signature]
Examiner-in-charge
[date signed]

When an "express determination" letter is issued to an institution, a copy of the letter as well as documentation of the work performed by examiners in their review of the institution's loan loss classification standards should be maintained in the workpapers. A copy of the letter should also be forwarded to the Regional Office with the Report of Examination. The issuance of an “express determination” letter should be noted in the Report of Examination according to procedure in the Report of Examination Instructions. An express determination letter should not be issued subsequent to the Report of Examination being finalized and distributed to the institution.

When an examiner-in-charge concludes that the conditions for issuing a requested "express determination" letter have not been met, the examiner-in-charge should discuss the reasons for this conclusion with the Regional Office. The examiner-in-charge should then advise institution management that the letter cannot be issued and explain the basis for this conclusion. A comment indicating that a requested "express determination" letter could not be issued, together with a brief statement of the reasons for not issuing the letter are addressed in the Report of Examination Instructions.

CONCENTRATIONS

Generally a concentration is a significantly large volume of economically-related assets that an institution has advanced or committed to one person, entity, or affiliated group. These assets may in the aggregate present a substantial risk to the safety and soundness of the institution. Adequate diversification of risk allows the institution to avoid the excessive risks imposed by credit concentrations. It should also be recognized, however, that factors such as location and economic environment of the area limit some institutions' ability to diversify. Where reasonable diversification realistically cannot be achieved, the resultant concentration calls for capital levels higher than the regulatory minimums.

Concentrations generally are not inherently bad, but do add a dimension of risk which the management of the institution should consider when formulating plans and policies. In formulating these policies, management typically addresses goals for portfolio mix and limits within the loan and other asset categories. The institution's business strategy, management expertise and location should be considered when reviewing the policy. Management should also consider the need to track and monitor the economic and financial condition of specific geographic locations, industries and groups of borrowers in which the institution has invested heavily. All concentrations should be monitored closely by management and receive a more in-depth review than the diversified portions of the institution's assets. Failure to monitor concentrations can result in management being unaware how significant economic events might impact the overall portfolio. This will also allow management to consider areas where concentration reductions may be necessary. Management and the board can monitor any reduction program using accurate concentration reports. If management is not properly monitoring concentration levels and limits, examiners may consider criticizing management.

To establish a meaningful tracking system for concentrations of credit, financial institutions should be encouraged to consider the use of codes to track individual borrowers, related groups of borrowers, industries, and individual foreign countries. Financial institutions should also be encouraged to use the North American Industry Classification System (NAICS) or similar code to track industry concentrations. Any monitoring program should be reported regularly to the board of directors.

Refer to the Report of Examination Instructions for guidance in identifying and listing concentrations in the examination report.

FEDERAL FUNDS SOLD AND REPURCHASE AGREEMENTS

Federal funds sold and securities purchased under agreement for resale represent convenient methods to employ excess funds to enhance earnings. Federal funds are excess reserve balances and take the form of a one-day transfer of funds between banks. These funds carry a specified rate of interest and are free of the risk of loss due to fluctuations in market prices entailed in buying and selling securities. However, these transactions are usually unsecured and therefore do entail potential credit risk. Securities purchased under agreement for resale represent an agreement between the buying and selling banks that stipulates the selling institution will buy back the securities sold at an agreed price at the expiration of a specified period of time.

Federal funds sold are not "risk free" as is often supposed, and the examiner will need to recognize the elements of risk involved in such transactions. While the selling of funds is on a one-day basis, these transactions may evolve into a continuing situation. This development is usually the result of liability management techniques whereby the buying institution attempts to utilize the acquired funds to support a rapid expansion of its loan-investment posture and as a means of enhancing profits. Of particular concern to the examiner is that, in many cases, the selling institution will automatically conclude that the buying institution's financial condition is above reproach without proper investigation and analysis. If this becomes the case, the selling institution may be taking an unacceptable risk unknowingly.

Another area of potential risk involves selling Federal funds to an institution which may be acting as an intermediary between the selling institution and the ultimate buying institution. In this instance, the intermediary institution is acting as agent with the true liability for repayment accruing to the third institution. Therefore, it is particularly important that the original selling institution be aware of this situation, ascertain the ultimate disposition of its funds, and be satisfied as to the creditworthiness of the ultimate buyer of the funds.

Clearly, the "risk free" philosophy regarding the sale of Federal funds is inappropriate. Selling banks must take the necessary steps to assure protection of their position. The examiner is charged with the responsibility of ascertaining that selling banks have implemented and adhered to policy directives in this regard to forestall any potentially hazardous situations.

Examiners should encourage management of banks engaged in selling Federal funds to implement a policy with respect to such activity. This policy generally would consider matters such as the aggregate sum to be sold at any one time, the maximum amount to be sold to any one buyer, the maximum duration of time the institution will sell to any one buyer, a list of acceptable buyers, and the terms under which a sale will be made. As in any form of lending, thorough credit evaluation of the prospective purchaser, both before granting the credit extension and on a continuing basis, is a necessity. Such credit analysis emphasizes the borrower's ability to repay, the source of repayment, and alternative sources of repayment should the primary source fail to materialize. While sales of Federal funds are normally unsecured unless otherwise regulated by State statutes, and while collateral protection is no substitute for thorough credit review, it is prudent for the selling institution to consider the possibility of requiring security if sales agreements are entered into on a continuing basis for specific but extended periods of time, or for overnight transactions which have evolved into longer term sales. Where the decision is made to sell Federal funds on an unsecured basis, the selling institution should be able to present logical reasons for such action based on conclusions drawn from its credit analysis of the buyer and bearing in mind the potential risk involved.

A review of Federal funds sold between examinations may prompt examiners to broaden the scope of their analysis of such activity if the transactions are not being handled in accordance with sound practices as outlined above. Where the institution has not developed a formal policy regarding the sale of Federal funds or fails to conduct a credit analysis of the buyer prior to a sale and during a continuous sale of such funds, the matter should be discussed with management. In such discussion, it is incumbent upon examiners to inform management that their remarks are not intended to cast doubt upon the financial strength of any institution to whom Federal funds are sold. Rather, the intent is to advise the banker of the potential risks of such practices unless safeguards are developed. The need for policy formulation and credit review on all Federal funds sold should be reinforced via a comment in the Report of Examination. Also, if Federal funds sold to any one buyer equals or exceeds 100 percent of the selling institution's Tier 1 Capital, it should be listed on the Concentrations schedule unless secured by U.S. Government securities. Based on the circumstances, the examiner should determine the appropriateness of additional comments regarding risk diversification.

Securities purchased under an agreement to resell are generally purchased at prevailing market rates of interest. The purchasing institution must keep in mind that the transaction merely represents another form of lending. Therefore, considerations normally associated with granting secured credit should be made. Repayment or repurchases by the selling institution is a major consideration, and the buying institution should satisfy itself that the selling institution will be able to generate the necessary funds to repurchase the securities on the prescribed date. Policy guidelines typically limit the amount of money extended to one seller. Collateral coverage arrangements should be controlled by procedures similar to the safeguards used to control any type of liquid collateral. Securities held under such an arrangement should not be included in the institution's investment portfolio but should be reflected in the Report of Examination under the caption Securities Purchased Under Agreements to Resell. Transactions of this nature do not require entries to the securities account of either institution with the selling institution continuing to collect all interest and transmit such payments to the buying institution.

FUNDAMENTAL LEGAL CONCEPTS AND DEFINITIONS

Laws and regulations that apply to credit extended by banks are more complicated and continually in a state of change. However, certain fundamental legal principles apply no matter how complex or innovative a lending transaction. To avoid needless litigation and ensure that each loan is a legally enforceable claim against the borrower or collateral, adherence to certain rules and prudent practices relating to loan transactions and documentation is essential. An important objective of the examiner's analysis of collateral and credit files is not only to obtain information about the loan, but also to determine if proper documentation procedures and practices are being utilized. While examiners are not expected to be experts on legal matters, it is important they be familiar with the Uniform Commercial Code (UCC) adopted by their respective states as well as other applicable State laws governing credit transactions. A good working knowledge of the various documents necessary to attain the desired collateral or secured position, and how those documents are to be used or handled in the jurisdiction relevant to the institution under examination, is also essential.

Uniform Commercial Code – Secured Transactions

Article 9 of the UCC governs secured transactions; i.e., those transactions which create a security interest in personal property or fixtures including goods, documents, instruments, general intangibles, chattel paper or accounts. Article 9 was significantly revised effective July 1, 2001, but each individual state must adopt the changes for it to become law. Because some states have enacted modified versions of the UCC and subsequent revisions, each applicable State statute should be consulted.

General Provisions

A Security Agreement is an agreement between a debtor and a secured party that creates or provides for a security interest. The Debtor is the person that has an interest in the collateral other than a security interest. The term Debtor also includes a seller of payment intangibles or promissory notes. The obligor is the person who owes on a secured transaction. The Secured Party is the lender, seller or other person in whose favor there is a security interest.

Grant of Security Interest

For a security interest to be enforceable against the debtor or third party with respect to the collateral, the collateral must be in the possession of the secured party pursuant to agreement, or the debtor must sign a security agreement which covers the description of the collateral.

Collateral

Any description of personal property or real estate is a sufficient description of the collateral whether or not it is specific if it reasonably identifies what is described. If the parties seek to include property acquired after the signing of the security agreement as collateral, additional requirements must be met.

Unless otherwise agreed a security agreement gives the secured party the rights to proceeds from the sale, exchange, collection or disposition of the collateral.
In some cases, the collateral that secures an obligation under one security agreement can be used to secure a new loan, too. This can be done by using a cross-collateralization clause in the security agreement.

Perfecting the Security Interest

Three terms basic to secured transactions are attachment, security agreement and security interest. Attachment refers to that point when the creditor's legal rights in the debtor's property come into existence or "attach." This does not mean the creditor necessarily takes physical possession of the property, or does it mean acquisition of ownership of the property. Rather, it means that before attachment, the borrower's property is free of any legal encumbrance, but after attachment, the property is legally bound by the creditor's security interest. In order for the creditor's security interest to attach, there must be a security agreement in which the debtor authenticates and provides a description of the collateral. A creditor's security interest can be possessory or nonpossessory, a secured party with possession pursuant to “agreement” means that the “agreement” for possession has to be an agreement that the person will have possession for purposes of security. The general rule is an institution must take possession of deposit accounts (proprietary), letter of credit rights, electronic chattel, paper, stocks and bonds to perfect a security interest therein. In a transaction involving a nonpossessory security interest, the debtor retains possession of the collateral. A security interest in collateral automatically attaches to the proceeds of the collateral and is automatically perfected in the proceeds if the credit was advanced to enable the purchase

A party's security interest in personal property is not protected against a debtor's other creditors unless it has been perfected. A security interest is perfected when it has attached and when all of the applicable steps required for perfection, such as the filing of a financing statement or possession of the collateral, have been taken. These provisions are designed to give notice to others of the secured party's interest in the collateral, and offer the secured party the first opportunity at the collateral if the need to foreclose should arise. If the security interest is not perfected, the secured party loses its secured status.

Right to Possess and Dispose of Collateral

Unless otherwise agreed, when a debtor defaults on a secured loan, a secured party has the right to take possession of the collateral without going to court if this can be done without breaching the peace. Alternatively, if the security agreement so provides, the secured party may require the debtor to assemble the collateral and make it available to the secured party at a place to be designated by the secured party which is reasonably convenient to both parties.

A secured party may then sell, lease or otherwise dispose of the collateral with the proceeds applied as follows: (a) foreclosure expenses, including reasonable attorneys' fees and legal expenses; (b) the satisfaction of indebtedness secured by the secured party's security interest in the collateral; and (c) the satisfaction of indebtedness secured by any subordinate security interest in the collateral if the secured party receives written notification of demand before the distribution of the proceeds is completed. If requested by the secured party, the holder of a subordinate security interest must furnish reasonable proof of his interest, and unless he does so, the secured party need not comply with his demand.

Examiners should determine institution policy concerning the verification of lien positions prior to advancing funds. Failure to perform this simple procedure may result in the institution unknowingly assuming a junior lien position and, thereby, greater potential loss exposure. Management may check filing records personally or a lien search may be performed by the filing authority or other responsible party. This is especially important when the institution grants new credit lines.

Agricultural Liens

An agricultural lien is generally defined as an interest, other than a security interest, in farm products that meets the following three conditions:

- The lien secures payment or performance of an obligation for goods or services furnished in connection with a debtor’s farming operation or rent on real property leased by a debtor in connection with its farming operation.
- The lien is created by statute in favor of a person that in the ordinary course of its business furnished goods or services to a debtor in connection with a debtor’s farming operation or leased property to a debtor in connection with the debtor’s farming operation.
- The lien’s effectiveness does not depend on the person’s possession of the personal property.

An agricultural lien is therefore non-possessory. Law outside of UCC-9 governs creation of agricultural liens and their attachment to collateral. An agricultural lien cannot be created or attached under Article 9. Article 9, however, does govern perfection. In order to perfect an agricultural lien, a financing statement must be filed. A perfected agricultural lien on collateral has priority over a conflicting security interest in or agricultural lien on the same collateral if the statute creating the agricultural lien provides for such priority. Otherwise, the agricultural lien is subject to the same priority rules as security interests (for example, date of filing).

A distinction is made with respect to proceeds of collateral for security interests and agricultural liens. For security interests, collateral includes the proceeds under Article 9. For agricultural liens, the collateral does not include proceeds unless State law creating the agricultural lien gives the secured party a lien on proceeds of the collateral subject to the lien.

Special Filing Requirements – There is a national uniform Filing System form. Filers, however are not required to use them. If permitted by the filing office, parties may file and otherwise communicate by means of records communicated and stored in a media other than paper. A peculiarity common to all states is the filing of a lien on aircraft; the security agreement must be submitted to the Federal Aviation Administration in Oklahoma City, Oklahoma.

Default and Foreclosure - As a secured party, an institution's rights in collateral only come into play when the obligor is in default. What constitutes default varies according to the specific provisions of each promissory note, loan agreement, security agreement, or other related documents. After an obligor has defaulted, the creditor usually has the right to foreclose, which means the creditor seizes the security pledged to the loan, sells it and applies the proceeds to the unpaid balance of the loan. For consumer transactions, there are strict consumer notification requirements prior to disposition of the collateral. For consumer transactions, the lender must provide the debtor with certain information regarding the surplus or deficiency in the disposition of collateral. There may be more than one creditor claiming a right to the sale proceeds in foreclosure situations. When this occurs, priority is generally established as follows: (1) Creditors with a perfected security interest (in the order in which lien perfection was attained); (2) Creditors with an unperfected security interest; and (3) General creditors.

Under the UCC procedure for foreclosing security interests, four concepts are involved. First is repossession or taking physical possession of the collateral, which may be accomplished with judicial process or without judicial process (known as self-help repossession), so long as the creditor commits no breach of the peace. The former is usually initiated by a replevin action in which the sheriff seizes the collateral under court order. A second important concept of UCC foreclosure procedures is redemption or the debtor's right to redeem the security after it has been repossessed. Generally, the borrower must pay the entire balance of the debt plus all expenses incurred by the institution in repossessing and holding the collateral. The third concept is retention that allows the institution to retain the collateral in return for releasing the debtor from all further liability on the loan. The borrower must agree to this action, hence would likely be so motivated only when the value of the security is likely to be less than or about equal to the outstanding debt. Finally, if retention is not agreeable to both borrower and lender, the fourth concept, resale of the security, comes into play. Although sale of the collateral may be public or private, notice to the debtor and other secured parties must generally be given. The sale must be commercially reasonable in all respects. Debtors are entitled to any surplus resulting from sale price of the collateral less any unpaid debt. If a deficiency occurs (i.e., the proceeds from sale of the collateral were inadequate to fully extinguish the debt obligation), the institution has the right to sue the borrower for this shortfall. This is a right it does not have under the retention concept.

Exceptions to the Rule of Priority - There are three exceptions to the general rule that the creditor with the earliest perfected security interest has priority. The first concerns a specific secured transaction in which a creditor makes a loan to a dealer and takes a security interest in the dealer's inventory. Suppose such a creditor files a financing statement with the appropriate public official to perfect the security interest. While it might be possible for the dealer's customers to determine if an outstanding security interest already exists against the inventory, it would be impractical to do so. Therefore, an exception is made to the general rule and provides that a buyer in the ordinary course of business, i.e., an innocent purchaser for value who buys in the normal manner, cuts off a prior perfected security interest in the collateral.

The second exception to the rule of priority concerns the vulnerability of security interests perfected by doing nothing. While these interests are perfected automatically, with the date of perfection being the date of attachment, they are extremely vulnerable at the hands of subsequent bona fide purchasers. Suppose, for example, a dealer sells a television set on a secured basis to an ultimate consumer. Since the collateral is consumer goods, the security interest is perfected the moment if attaches. But if the original buyer sells the television set to another person who buys it in good faith and in ignorance of the outstanding security interest, the UCC provides that the subsequent purchase cuts off the dealer's security interest. This second exception is much the same as the first except for one important difference: the dealer (creditor) in this case can be protected against purchase of a customer's collateral by filing a financing statement with the appropriate public official.

The third exception regards the after-acquired property clause that protects the value of the collateral in which the creditor has a perfected security interest. The after-acquired property clause ordinarily gives the original creditor senior priority over creditors with later perfected interests. However, it is waived as regards the creditor who supplies replacements or additions to the collateral or the artisan who supplies materials and services that enhance the value of the collateral as long as a perfected security interest in the replacement or additions, or collateral is held.

Borrowing Authorization

Borrowing authorizations in essence permit one party to incur liability for another. In the context of lending, this usually concerns corporations. A corporation may enter into contracts within the scope of the powers authorized by its charter. In order to make binding contracts on behalf of the corporation, the officers must be authorized to do so either by the board of directors or by expressed or implied general powers. Usually a special resolution expressly gives certain officers the right to obligate the corporate entity, pledge assets as collateral, agree to other terms of the indebtedness and sign all necessary documentation on behalf of the corporate entity.

Although a general resolution is perhaps satisfactory for the short-term, unsecured borrowings of a corporation, a specific resolution of the corporation's board of directors is generally advisable to authorize such transactions as term loans, loans secured by security interests in the corporation's personal property, or mortgages on real estate. Further, mortgaging or pledging substantially all of the corporation's assets without prior approval of the shareholders of the corporation is often prohibited, therefore, an institution may need to seek advice of counsel to determine if shareholder consent is required for certain contemplated transactions.

Loans to corporations should indicate on their face that the corporation is the borrower. The corporate name should appear followed by the name, title and signature of the appropriate officer. If the writing is a negotiable instrument, the UCC states the party signing is personally liable as a general rule. To enforce payment against a corporation, the note or other writing should clearly show that the debtor is a corporation.

Bond and Stock Powers

As mentioned previously, an institution generally obtains a security interest in stocks and bonds by possession. The documents which allow the institution to sell the securities if the borrower defaults are called stock powers and bond powers. The examiner should ensure the institution has, for each borrower who has pledged stocks or bonds, one signed stock power for all stock certificates of a single issuer, and a separate signed bond power for each bond instrument. The signature must agree with the name on the actual stock certificate or bond instrument. Refer to Federal Reserve Board Regulations Part 221 (Reg U) for further information on loans secured by investment securities.

Comaker

Two or more persons who are parties to a contract or promise to pay are known as comakers. They are a unit to the performance of one act and are considered primarily liable. In the case of default on an unsecured loan, a judgment would be obtained against all. A release against one is a release against all because there is but one obligation and if that obligation is released as to one obligor, it is released as to all others.

Loan Guarantee

Since banks often condition credit advances upon the backup support provided by third party guarantees, examiners should understand the legal fundamentals governing guarantees. A guarantee may be a guarantee of payment or of collection. "Payment guaranteed" or equivalent words added to a signature means that if the instrument is not paid when due, the guarantor will pay it according to its terms without resort by the holder to any other party. "Collection guaranteed" or equivalent words added to a signature means that if the instrument is not paid when due, the guarantor will pay it, but only after the holder has reduced to judgment a claim against the maker and execution has been returned unsatisfied, or after the maker has become insolvent or it is otherwise useless to proceed against such a party.

Contracts of guarantee are further divided into a limited guarantee which relates to a specific note (often referred to as an "endorsement") or for a fixed period of time, or a continuing guarantee which, in contrast, is represented by a separate instrument and enforceable for future (duration depends upon State law) transactions between the institution and the borrower or until revoked. A well-drawn continuing guarantee contains language substantially similar to the following: "This is an absolute and unconditional guarantee of payment, is unconditionally delivered, and is not subject to the procurement of a guarantee from any person other than the undersigned, or to the performance or happening of any other condition." The aforementioned unambiguous terms are necessary to the enforceability of contracts of guarantee, as they are frequently entered into solely as an accommodation for the borrower and without the guarantor's participation in the benefits of the loan. Thus, courts tend to construe contracts of guarantee strictly against the party claiming under the contract. Unless the guarantee is given prior to or at the time the initial loan is made, the guarantee may not be enforceable because of the difficulty of establishing that consideration was given. Institutions should not disburse funds on such loans until they have the executed guarantee agreement in their possession. Institutions should also require the guarantee be signed in the presence of the loan officer, or, alternatively, that the guarantor's signature be notarized. If the proposed guarantor is a partnership, joint venture, or corporation, the examiner should ensure the signing party has the legal authority to enter into the guarantee agreement. Whenever there is a question concerning a corporation's authority to guarantee a loan, counsel should be consulted and a special corporate resolution passed by the organization's board of directors.

Subordination Agreement

An institution extending credit to a closely held corporation may want to have the company's officers and shareholders subordinate to the institution's loan any indebtedness owed them by the corporation. This is accomplished by execution of a subordination agreement by the officers and shareholders. Subordination agreements are also commonly referred to as standby agreements. Their basic purpose is to prevent diversion of funds from reduction of institution debt to reduction of advances made by the firm's owners or officers.

Hypothecation Agreement

This is an agreement whereby the owner of property grants a security interest in collateral to the institution to secure the indebtedness of a third party. Institutions often take possession of the stock certificates, plus stock powers endorsed in blank, in lieu of a hypothecation agreement. Caution, however, dictates that the institution take a hypothecation agreement setting forth the institution's rights in the event of default.

Real Estate Mortgage

A mortgage may be defined as a conveyance of realty given with the intention of providing security for the payment of debt. There are several different types of mortgage instruments but those commonly encountered are regular mortgages, deeds of trust, equitable mortgages, and deeds absolute given as security.

Regular Mortgages - The regular mortgage involves only two parties, the borrower and the lender. The mortgage document encountered in many states today is referred to as the regular mortgage. It is, in form, a deed or conveyance of realty by the borrower to the lender followed or preceded by a description of the debt and the property, and includes a provision to the effect that the mortgage be released upon full payment of the debt. Content of additional paragraphs and provisions varies considerably.

Deeds of Trust - In the trust deed, also known as the deed of trust, the borrower conveys the realty not to the lender but to a third party, a trustee, in trust for the benefit of the holder of the notes(s) that constitutes the mortgage debt. The deed of trust form of mortgage has certain advantages, the principle being that in a number of states it can be foreclosed by trustee's sale under the power of sale clause without court proceedings.

Equitable Mortgages - As a general rule, any instrument in writing by which the parties show their intention that realty be held as security for the payment of a debt, constitutes an equitable mortgage capable of being foreclosed in a court of equity.

Deeds Absolute Given as Security - Landowners who borrow money may give as security an absolute deed to the land. "Absolute deed" means a quitclaim or warranty deed such as is used in an ordinary realty sale. On its face, the transaction appears to be a sale of the realty; however, the courts treat such a deed as a mortgage where the evidence shows that the instrument was really intended only as security for a debt. If such proof is available, the borrower is entitled to pay the debt and demand reconveyance from the lender, as in the case of an ordinary mortgage. If the debt is not paid, the grantee must foreclose as if a regular mortgage had been made.

The examiner should determine whether the institution has performed a title and lien search of the property prior to taking a mortgage or advancing funds. Proper procedure calls for an abstractor bringing the abstract up to date, and review of the abstract by an attorney or title insurance company. If an attorney performs the task, the abstract will be examined and an opinion prepared indicating with whom title rests, along with any defects and encumbrances disclosed by the abstract. Like an abstractor, an attorney is liable only for damages caused by negligence. If a title insurance company performs the task of reviewing the abstract, it does essentially the same thing; however, when title insurance is obtained, it represents a contract to make good, loss arising through defects in title to real estate or liens or encumbrances thereon. Title insurance covers various items not covered in an abstract and title opinion. Some of the more common are errors by abstractors or attorneys include unauthorized corporate action, mistaken legal interpretations, and unintentional errors in public records by public officials. Once the institution determines title and lien status of the property, the mortgage can be prepared and funds advanced. The institution should record the mortgage immediately after closing the loan. Form, execution, and recording of mortgages vary from state to state and therefore must conform to the requirements of State law.

Collateral Assignment

An assignment is generally considered as the transfer of a legal right from one person to another. The rights acquired under a contract may be assigned if they relate to money or property, but personal services may not be assigned. Collateral assignments are used to establish the institution's rights as lender in the property or asset serving as collateral. It is generally used for loans secured by savings deposits, certificates of deposit or other cash accounts as well as loans backed by cash surrender value of life insurance. In some instances, it is used in financing accounts receivable and contracts. If a third party holder of the collateral is involved, such as life insurance company or the payor of an assigned contract, an acknowledgement should be obtained from that party as to the institution's assigned interest in the asset for collateral purposes.

CONSIDERATION OF BANKRUPTCY LAW AS IT RELATES TO COLLECTIBILITY OF A DEBT

Introduction

Familiarity with the basic terms and concepts of the Federal bankruptcy law (formally known as the Bankruptcy Reform Act of 1978) is necessary in order for examiners to make informed judgments concerning the likelihood of collection of loans to bankrupt individuals or organizations. The following paragraphs present an overview of the subject. Complex situations may arise where more in-depth consideration of the bankruptcy provisions may be necessary and warrant consultation with the institution's attorney, Regional Counsel or other member of the Regional Office staff. For the most part, however, knowledge of the following information when coupled with review of credit file data and discussion with institution management should enable examiners to reach sound conclusions as to the eventual repayment of the institution's loans.

Forms of Bankruptcy Relief

Liquidation and rehabilitation are the two basic types of bankruptcy proceedings. Liquidation is pursued under Chapter 7 of the law and involves the bankruptcy trustee collecting all of the debtor's nonexempt property, converting it into cash and distributing the proceeds among the debtor's creditors. In return, the debtor obtains a discharge of all debts outstanding at the time the petition was filed which releases the debtor from all liability for those pre-bankruptcy debts.

Rehabilitation (sometimes known as reorganization) is effected through Chapter 11 or Chapter 13 of the law and in essence provides that creditors' claims are satisfied not via liquidation of the obligor's assets but rather from future earnings. That is, debtors are allowed to retain their assets but their obligations are restructured and a plan is implemented whereby creditors may be paid.

Chapter 11 bankruptcy is available to all debtors, whether individuals, corporations or partnerships. Chapter 13 (sometimes referred to as the "wage earner plan"), on the other hand, may be used only by individuals with regular incomes and when their unsecured debts are under $100,000 and secured debts less than $350,000. The aforementioned rehabilitation plan is essentially a contract between the debtor and the creditors. Before the plan may be confirmed, the bankruptcy court must find it has been proposed in good faith and that creditors will receive an amount at least equal to what would be received in a Chapter 7 proceeding. In Chapter 11 reorganization, all creditors are entitled to vote on whether or not to accept the repayment plan. In Chapter 13 proceedings, only secured creditors are so entitled. A majority vote binds the minority to the plan, provided the latter will receive pursuant to the plan at least the amount they would have received in a straight liquidation. The plan is fashioned so that it may be carried out in three years although the court may extend this to five years.

Most cases in bankruptcy courts are Chapter 7 proceedings, but reorganization cases are increasingly common. From the creditor's point of view, Chapter 11 or 13 filings generally result in greater debt recovery than do liquidation situations under Chapter 7. Nonetheless, the fact that reorganization plans are tailored to the facts and circumstances applicable to each bankrupt situation means that they vary considerably and the amount recovered by the creditor may similarly vary from nominal to virtually complete recovery.

Functions of Bankruptcy Trustees

Trustees are selected by the borrower's creditors and are responsible for administering the affairs of the bankrupt debtor's estate. The bankrupt's property may be viewed as a trust for the benefit of the creditors, consequently it follows the latter should, through their elected representatives, exercise substantial control over this property.

Voluntary and Involuntary Bankruptcy

When a debtor files a bankruptcy petition with the court, the case is described as a voluntary one. It is not necessary the individual or organization be insolvent in order to file a voluntary case. Creditors may also file a petition, in which case the proceeding is known as an involuntary bankruptcy. However, this alternative applies only to Chapter 7 cases and the debtor generally must be insolvent, i.e., unable to pay debts as they mature, in order for an involuntary bankruptcy to be filed.

Automatic Stay

Filing of the bankruptcy petition requires (with limited exceptions) creditors to stop or "stay" further action to collect their claims or enforce their liens or judgements. Actions to accelerate, set off or otherwise collect the debt are prohibited once the petition is filed, as are post- bankruptcy contacts with the obligor. The stay remains in effect until the debtor's property is released from the estate, the bankruptcy case is dismissed, the debtor obtains or is denied a discharge, or the bankruptcy court approves a creditor's request for termination of the stay. Two of the more important grounds applicable to secured creditors under which they may request termination are as follows: (1) The debtor has no equity in the encumbered property, and the property is not necessary to an effective rehabilitation plan; or (2) The creditor's interest in the secured property is not adequately protected. In the latter case, the law provides three methods by which the creditor's interests may be adequately protected: the creditor may receive periodic payments equal to the decrease in value of the creditor's interest in the collateral; an additional or substitute lien on other property may be obtained; or some other protection is arranged (e.g., a guarantee by a third party) to adequately safeguard the creditor's interests. If these alternatives result in the secured creditor being adequately protected, relief from the automatic stay will not be granted. If relief from the stay is obtained, creditors may continue to press their claims upon the bankrupt's property free from interference by the debtor or the bankruptcy court.

Property of the Estate

When a borrower files a bankruptcy petition, an "estate" is created and, under Chapter 7 of the law, the property of the estate is passed to the trustee for distribution to the creditors. Certain of the debtor's property is exempt from distribution under all provisions of the law (not just Chapter 7), as follows: homeowner's equity up to $7,500; automobile equity and household items up to $1,200; jewelry up to $500; cash surrender value of life insurance up to $4,000; Social Security benefits (unlimited); and miscellaneous items up to $400 plus any unused portion of the homeowner's equity. The bankruptcy code recognizes a greater amount of exemptions may be available under State law and, if State law is silent or unless it provides to the contrary, the debtor is given the option of electing either the Federal or State exemptions. Examiners should note that some liens on exempt property which would otherwise be enforceable are rendered unenforceable by the bankruptcy. A secured lender may thus become unsecured with respect to the exempt property. The basic rule in these situations is that the debtor can render unenforceable judicial liens on any exempt property and security interests that are both nonpurchase money and nonpossessory on certain household goods, tools of the trade and health aids.

Discharge and Objections to Discharge

The discharge, as mentioned previously, protects the debtor from further liability on the debts discharged. Sometimes, however, a debtor is not discharged at all (i.e., the creditor has successfully obtained an "objection to discharge") or is discharged only as regards to a specific creditor(s) and a specific debt(s) (an action known as "exception to discharge"). The borrower obviously remains liable for all obligations not discharged, and creditors may pursue customary collection procedures with respect thereto. Grounds for an "objection to discharge" include the following actions or inactions by the bankrupt debtor (this is not an all-inclusive list): fraudulent conveyance within 12 months of filing the petition; unjustifiable failure to keep or preserve financial records; false oath or account or presentation of a false claim in the bankruptcy case and estate, respectively; withholding of books or records from the trustee; failure to satisfactorily explain any loss or deficiency of assets; refusal to testify when legally required to do so; and receiving a discharge in bankruptcy within the last six full years. Some of the bases upon which creditors may file "exceptions to discharge" are: nonpayment of income taxes for the three years preceding the bankruptcy; money, property or services obtained through fraud, false pretenses or false representation; debts not scheduled on the bankruptcy petition and which the creditor had no notice; alimony or child support payments (this exception may be asserted only by the debtor's spouse or children, property settlements are dischargeable); and submission of false or incomplete financial statements. If an institution attempts to seek an exception on the basis of false financial information, it must prove the written financial statement was materially false, it reasonably relied on the statement, and the debtor intended to deceive the institution. These assertions can be difficult to prove. Discharges are unavailable to corporations or partnerships. Therefore, after a bankruptcy, corporations and partnerships often dissolve or become defunct.

Reaffirmation

Debtors sometimes promise their creditors after a bankruptcy discharge that they will repay a discharged debt. An example wherein a debtor may be so motivated involves the home mortgage. To keep the home and discourage the mortgagee from foreclosing, a debtor may reaffirm this obligation. This process of reaffirmation is an agreement enforceable through the judicial system. The law sets forth these basic limitations on reaffirmations: the agreement must be signed before the discharge is granted; a hearing is held and the bankruptcy judge informs the borrower there is no requirement to reaffirm; and the debtor has the right to rescind the reaffirmation if such action is taken within 30 days.

Classes of Creditors

The first class of creditors is known as priority creditors. As the name implies, these creditors are entitled to receive payment prior to any others. Priority payments include administrative expenses of the debtor's estate, unsecured claims for wages and salaries up to $2,000 per person, unsecured claims for employee benefit plans, unsecured claims of individuals up to $900 each for deposits in conjunction with rental or lease of property, unsecured claims of governmental units and certain tax liabilities. Secured creditors are only secured up to the extent of the value of their collateral. They become unsecured in the amount by which collateral is insufficient to satisfy the claim. Unsecured creditors are of course the last class in terms of priority.

Preferences

Certain actions taken by a creditor before or during bankruptcy proceedings may be invalidated by the trustee if they result in some creditors receiving more than their share of the debtor's estate. These actions are called "transfers" and fall into two categories. The first involves absolute transfers, such as payments received by a creditor; the trustee may invalidate this action and require the payment be returned and made the property of the bankrupt estate. A transfer of security, such as the granting of a mortgage, may also be invalidated by the trustee. Hence, the trustee may require previously encumbered property be made unencumbered, in which case the secured party becomes an unsecured creditor. This has obvious implications as regards loan collectibility.

Preferences are a potentially troublesome area for banks and examiners should have an understanding of basic principles applicable to them. Some of the more important of these are listed here.

- A preference may be invalidated (also known as "avoided") if it has all of these elements: the transfer was to or for the benefit of a creditor; the transfer was made for or on account of a debt already outstanding; the transfer has the effect of increasing the amount a creditor would receive in Chapter 7 proceedings; the transfer was made within 90 days of the bankruptcy filing, or within one year if the transfer was to an insider who had reasonable cause to believe the debtor was insolvent at the time of transfer; and the debtor was insolvent at the time of the transfer. Under bankruptcy law, borrowers are presumed insolvent for 90 days prior to filing the bankruptcy petition.
- Payment to a fully secured creditor is not a preference because such a transfer would not have the effect of increasing the amount the creditor would otherwise receive in a Chapter 7 proceeding. Payment to a partially secured creditor does, however, have the effect of increasing the creditor's share and is thus deemed a preference which the trustee may avoid.
- Preference rules also apply to a transfer of a lien to secure past debts, if the transfer has all five elements set forth under the first point.
- There are certain situations wherein a debtor has given a preference to a creditor but the trustee is not permitted to invalidate it. A common example concerns floating liens on inventory under the Uniform Commercial Code. These matters are subject to complex rules, however, and consultation with the Regional Office may be advisable when this issue arises.

Setoffs

Setoffs occur when a party is both a creditor and a debtor of another; amounts which a party owes are netted against amounts which are owed to that party. If an institution exercises its right of setoff properly and before the bankruptcy filing, the action is generally upheld in the bankruptcy proceedings. Setoffs made after the bankruptcy may also be valid but certain requirements must be met of which the following are especially important: First, the debts must be between the same parties in the same right and capacity. For example, it would be improper for the institution to setoff the debtor's loan against a checking account of the estate of the obligor's father, of which the debtor is executor. Second, both the debt and the deposit must precede the bankruptcy petition filing. Third, the setoff may be disallowed if funds were deposited in the institution within 90 days of the bankruptcy filing and for the purpose of creating or increasing the amount to be set off.

Transfers Not Timely Perfected or Recorded

Under most circumstances, an institution which has not recorded its mortgage or otherwise fails to perfect its security interest in a proper timely manner runs great risk of losing its security. This is a complex area of the law but prudence clearly dictates that liens be properly obtained and promptly filed so that the possibility of losing the protection provided by collateral is eliminated.

SYNDICATED LENDING

Overview

Syndicated loans often represent a substantial portion of the commercial and industrial loan portfolios of large banks. A syndicated loan involves two or more banks contracting with a borrower, typically a large or middle market corporation, to provide funds at specified terms under the same credit facility. The average commercial syndicated credit is in excess of $100 million. Syndicated credits differ from participation loans in that lenders participate jointly in the origination process, as opposed to one originator selling undivided participation interests to third parties. In a syndicated transaction, each financial institution receives a pro rata share of the income based on the level of participation in the credit. Additionally, one or more lenders take on the role of *lead* or *agent* (co-agents in the case of more than one) of the credit and assume responsibility of administering the loan for the other lenders. The agent may retain varying percentages of the credit, which is commonly referred to as the hold *level*.

The syndicated-lending market formed to meet basic needs of lenders and borrowers, such as:

- Raising large amounts of money,
- Enabling geographic diversification,
- Obtaining working capital quickly and efficiently,
- Diversifying credit risk among banks, and
- Gaining attractive pricing advantages.

In times of excess liquidity in the marketplace, spreads typically are quite narrow for investment-grade facilities, thus making it a borrower's market. This may be accompanied by an easing of the structuring and covenants. In spite of tightening margins, commercial banks are motivated to compete regarding pricing in order to retain other business as well as generate fee income.

Relaxing covenants and pricing may result in lenders relying heavily on market valuations, or so-called "enterprise values" in arriving at credit decisions. These values are derived by applying a current-period multiple to cash flows (which uses data from comparable companies within the same industry), or discounting projected cash flows over several years (which typically uses an average cost of capital as the discount rate). This value represents the intangible business value of a company as a going concern, which often exceeds its underlying hard assets.

Many deals involve merger and acquisition financing. While the primary originators of the syndicated loans are commercial banks, most of the volume is sold and held by other investors.

A subset of syndicated lending is leveraged lending which refers to borrowers with an elevated level of debt and debt service compared with cash flow. By their very nature, these instruments are of higher risk.

Syndication Process

There are four phases in loan syndications: Pre-Launch, Launch, Post-Launch, and Post-Closing.

The Pre-Launch Process - During this phase, the syndicators identify the borrower's needs and perform their initial due diligence. Industry information is gathered and analyzed, and background checks may be performed. Potential pricing and structure of the transaction takes shape. Formal credit write-ups are sent to credit officers for review and to senior members of the syndication group for pricing approval. Competitive bids are sent to the borrower. The group then prepares for the launch.

An information memorandum is prepared by the agent. This memorandum is a formal and confidential document that should address all principal credit issues relating to the borrower and to the project being financed. It typically contains an overview of the transaction including a term sheet, an overview of the borrower's business, and quarterly and annual certified financial statements. This document acts as both the marketing tool and as the source of information for the syndication.

The Launch Phase - The transaction is launched into the market when banks are sent the information memoranda mentioned above. Legal counsel commences to prepare the documentation. Negotiations take place between the banks and the borrower over pricing, collateral, covenants, and other terms. Often there is an institution meeting so potential participants can discuss the company's business and industry both with the lead agent and with the company.

Post-Launch Phase - Typically there is a two-week period for potential participants to evaluate the transaction and to decide whether or not to participate in the syndication. During this period, banks do their due diligence and credit approval. Often this entails running projection models, including stress tests, doing business and industry research, and presenting the transaction for the approval process once the decision is made to commit to the transaction.

After the commitment due date, participating banks receive a draft credit agreement for their comments. Depending upon the complexity of the agreement, they usually have about a week to make comments. The final credit agreement is then negotiated based on the comments and the loan would then close two to five days after the credit agreement is finalized.

Post-Closing Phase - Post-Closing, there usually is an ongoing dialogue with the borrower about financial/operating performance as well as quarterly credit agreement covenant compliance checks. Annually, a full credit analysis typically is done as well as annual meetings of the participants for updates on financial and operating performance. Both the agent institution and the participants need to assess the loan protection level by analyzing the business risk as well as the financial risk. Each industry has particular dominant risks to be assessed.

Loan Covenants

Loan covenants are special conditions included in a loan agreement that the borrower is required to fulfill in order for the loan agreement to remain valid. Typically, covenants cover several domains but can broadly be divided into financial and non-financial categories. Effective financial covenants establish an operating framework using conditions defined in absolute amounts or ratios. If exceeded by the borrower, the covenants provide lenders the opportunity to further strengthen collateral controls or adjust interest rates. Some examples are:

Net Worth test: restricts the total amount of debt a borrower can incur, expressed as a percentage of net worth.

Current Ratio/ Quick Ratio test: measures liquidity.

Interest, Debt Service or Fixed Charge Coverage test: assures that some level of cash flow is generated by a company above its interest expense and other fixed obligations. The proxy for cash flow is usually EBITDA (earnings before interest, taxes, depreciation and amortization).

Capital Expenditure Limitations: generally set according to the company's business plan and then measured accordingly.

Borrowing Base Limitations: lending formula typically based on eligible accounts receivable and inventory. At times, the formula may also include real estate or other non-current assets.

Leverage test: actual leverage covenant levels vary by industry segment. Typical ratios include Total Debt divided by EBITDA, Senior Debt divided by EBITDA and Net Debt (subtracts cash) divided by EBITDA.

Non-financial covenants may include restrictions on other matters such as management changes, provisions of information, guarantees, disposal of assets, etc.

Credit Rating Agencies

The large credit rating agencies (Standard and Poor's, Moody's, and Fitch Investor Services) provide coverage of many syndicated loans at origination and periodically during the life of the loan. Credit ratings issued by these agencies reflect a qualitative and quantitative evaluation of financial and other information of the prospective borrower, including information provided by the borrower and other non-public information.

Credit ratings may represent the overall corporate credit rating of a borrower or reflect analysis of a borrower's specific financial instruments, such as their syndicated loans. Credit ratings for each financial instrument reflect the general credit risk of the borrower, their ability to repay the debt, and the probability of the borrower defaulting on the instrument in question. Some credit rating agencies also provide separate ratings that consider the financial loss the holder of a financial instrument such as a syndicated loan may incur if a borrower defaults.

Overview of the Shared National Credit (SNC) Program

The Shared National Credit (SNC) Program is an interagency initiative administered jointly by the FDIC, Federal Reserve Board, and the Office of the Comptroller of the Currency. The program was established in the 1970's for the purpose of ensuring consistency among the three Federal banking regulators in the classification of large syndicated credits.

Definition of a SNC

Any loan or formal loan commitment, including any asset such as other real estate, stocks, notes, bonds and debentures taken for debts previously contracted, extended to a borrower by a supervised institution, or any of its subsidiaries and affiliates, which in original amount aggregates $100 million or more and, which is shared by three or more unaffiliated institutions under a formal lending agreement; or, a portion of which is sold to two or more unaffiliated institutions, with the purchasing institution(s) assuming its pro rata share of the credit risk.

SNC's generally include:

- Loans administered by a domestic office of a supervised institution;
- Domestic commercial and real estate loans and all international loans to borrowers in the private sector; and
- Acceptances, commercial letters of credit, standby letters of credit or similar bonds or guarantees, note issuance facilities, revolving underwriting facilities, Eurodollar facilities, syndications, and similar extensions or commitments, and lease financing receivables.

SNCs Do Not Include:

- Credits shared solely between affiliated supervised institutions;
- Private sector credits that are 100 percent guaranteed by a sovereign entity;
- International credits or commitments administered in a foreign office;
- Direct credits to sovereign borrowers.

SNC Review and Rating Process

Teams of interagency examiners review and risk rate a sample of credits at agent banks during the first and third quarters of each year. Of note, SNC reviews occur regularly at agent banks originating a significant level of SNC credits. For agent banks with smaller SNC portfolios, credits are only reviewed through the program on an ad hoc basis. The SNC review sample is based on internal rating, industry, size, and the number of regulated participants. The regulatory rating assigned by an interagency team of examiners is reported to all participating banks shortly after the conclusion of the on-site review voting period. Ratings remain active on a rolling two review basis (approximately 1 year), thus avoiding duplicate reviews of the same loan and ensuring consistent treatment with regard to regulatory credit ratings. Examiners should not change SNC ratings during risk management examinations. Any material change in a borrower's condition should be reported to the national SNC coordinator.

The SNC rating process includes risk rating, accrual and TDR status. Impairment measurement and ALLL treatment are not addressed in the SNC rating and should be reviewed at each participant institution. Current and historical SNC ratings can be accessed through the FDIC's internal systems. Designated SNC credits not reviewed in the current SNC sample will be listed as "Not Rated." These credits may be reviewed separately at the participant institution if significant to the examination scope or an examiner believes that the credit may carry an adverse rating.

The FDIC's SNC office can provide examiners with additional information to facilitate the review of "Not Rated" credits or copies of line sheets used in the interagency SNC review to help examiners explain rating rationales to participant banks. In those situations where a "Not Rated" credit is reviewed at the participant institution and an adverse rating is assigned, examiners should communicate their findings to the national SNC coordinator.

SNC Rating Communication and Distribution Process

At the conclusion of each semi-annual SNC review, electronic reports are generated, and notifications are sent via email to participant institution contacts. They are provided a link to retrieve a summary of ratings, applicable loan write-ups, cover letter and a list of agent institution contacts. These reports are available to examiners upon request and can be retransmitted to the participant institution contact if needed. The notification email also marks the beginning of a 14 day window for banks to file an appeal.

Appeals Process

Agent and participant banks may appeal any preliminary rating. Agent and participant banks have 14 days from the electronic distribution of preliminary results to submit an appeal. The written appeal details the reasons why the institution is disputing the classification and includes documentation supporting the institution's position. The written appeal is sent to the applicable agency of the agent institution for the credit in question. An interagency appeals panel reviews the appeal, determines the final disposition of the credit, and informs the institution of its decision in writing. Ratings changed by the appeals process are communicated electronically to all affected participant banks.

Additional Risks Associated with Syndicated Loan Participations

An institution that purchases a participation interest in large loan syndications faces the same risks as an institution purchasing an ordinary loan participation from another institution. Examiners should reference the manual section on *Loan Participations* for a more in depth discussion of related risks. As discussed in that section, an institution purchasing a participation loan is expected to perform the same degree of independent credit analysis on the loan as if it were the originator. The same holds true for banks purchasing participation interests in large syndications. Institutions that lack the resources or skill sets to perform an independent credit analysis on a complex loan syndication generally refrain from participating in such a transaction.

In some cases, an institution may enter into a sub-participation agreement in which the institution purchases a piece of a participation from another syndicated loan participant rather than directly from the agent institution. As a result, the sub-participant may not be registered with or known to the agent institution and may not receive timely notification of risk ratings or adverse credit actions from either the agent institution or the SNC system.

Additionally, sub-participants may not have the same legal rights or remedies as participants of record in the syndicate, which may give rise to other transactional and operational risk concerns.

←

CREDIT SCORING

Automated credit scoring systems allow institutions to underwrite and price loans more quickly than was possible in the past. This efficiency has enabled some banks to expand their lending into national markets and originate loan volumes once considered infeasible. Scoring also reduces unit-underwriting costs, while yielding a more consistent loan portfolio that is easily securitized. These benefits have been the primary motivation for the proliferation of credit scoring systems among both large and small institutions.

Credit scoring systems identify specific characteristics that help define predictive variables for acceptable performance (delinquency, amount owed on accounts, length of credit history, home ownership, occupation, income, etc.) and assign point values relative to their overall importance. These values are then totaled to calculate a credit score, which helps institutions to rank order risk for a given population. Generally, an individual with a higher score will perform better relative to an individual with a lower credit score.

Few, if any, institutions have an automated underwriting system where the credit score is used exclusively to make the credit decision. Some level of human review is usually present to provide the flexibility needed to address individual circumstances. Institutions typically establish a minimum cut-off score below which applicants are denied and a second cutoff score above which applicants are approved. However, there is usually a range, or "gray area," in between the two cut-off scores where credits are manually reviewed and credit decisions are judgmentally determined.

Most, if not all, systems also provide for overrides of established cut-off scores. If the institution's scoring system effectively predicts loss rates and reflects management's risk parameters, excessive overrides will negate the benefits of an automated scoring system. Therefore, it is critical for management to monitor and control overrides. Institutions typically develop acceptable override limits and prepare monthly override reports that provide comparisons over time and against the institution's parameters. Override reports also typically identify the approving officer and include the reason for the override.

Although banks often use more than one type of credit scoring methodology in their underwriting and account management practices, many systems incorporate credit bureau scores. Credit bureau scores are updated periodically and validated on an ongoing basis against performance in credit bureau files. Scores are designed to be comparable across the major credit bureaus; however, the ability of any score to estimate performance outcome probabilities depends on the quality, quantity, and timely submission of lender data to the various credit bureaus. Often, the depth and thoroughness of data available to each credit bureau varies, and as a consequence, the quality of scores varies.

As a precaution, institutions that rely on credit bureau scores often sample and compare credit bureau reports to determine which credit bureau most effectively captures data for the market(s) in which the institution does business. For institutions that acquire credit from multiple regions, use of multiple scorecards may be appropriate, depending on apparent regional credit bureau strength. In some instances, it may be worthwhile for institutions to pull scores from each of the major credit bureaus and establish rules for selecting an average value. By tracking credit bureau scores over time and capturing performance data to differentiate which score seems to best indicate probable performance outcome, institutions can select the best score for any given market. Documenting such efforts to differentiate and select the best credit bureau score supports a deliberative decision process.

Although some institutions develop their own scoring models, most are built by outside vendors and subsequently maintained by the institution. Vendors build scoring models based upon specific information and parameters provided by institution management. Therefore, management must clearly communicate with the vendor and ensure that the scorecard developer clearly understands the institution's objectives. Bank management that adheres closely to vendor manual specifications for system maintenance and management, particularly those that provide guidance for periodically assessing performance of the system, achieve the most reliable results.

Scoring models generally become less predictive as time passes. Certain characteristics about an applicant, such as income, job stability, and age change over time, as do overall demographics. One-by-one, these changes will result in significant shifts in the profile of the population. Once a fundamental change in the profile occurs, the model is less able to identify potentially good and bad applicants. As these changes continue, the model loses its ability to rank order risk. Thus, for the best results, institutions must periodically validate the system's predictability, refine scoring characteristics when necessary, and document these efforts.

Institutions initially used credit scoring for consumer lending applications such as credit card, auto, and mortgage lending. However, credit scoring eventually gained acceptance in the small business sector. Depending on the manner in which it is implemented, credit scoring for small business lending may represent a fundamental shift in underwriting philosophy if institutions view a small business loan as more of a high-end consumer loan and, thus, grant credit more on the strength of the principals' personal credit history and less on the fundamental strength of the business. While this may be appropriate in some cases, it is important to remember that the income from small business remains the primary source of repayment for most loans. Institutions that do not analyze business financial statements or periodically review their lines of credit may lose an opportunity for early detection of credit problems.

The effectiveness of any scoring system directly depends on the policies and procedures established to guide and enforce proper use. The most effective policies include an overview of the institution's scoring objectives and operations; the establishment of authorities and responsibilities over scoring systems; the use of a chronology log to track internal and external events that affect the scoring system; the establishment of institution officials responsible for reporting, monitoring, and reviewing overrides; as well as the provision of a scoring system maintenance program to ensure that the system continues to rank risk and to predict default and loss under the original parameters.

Examiners should refer to the Credit Card Specialty Bank Examination Guidelines and the Credit Card Activities section of the Examination Modules for additional information on credit scoring systems.

←

SUBPRIME LENDING

Introduction

There is no universal definition of a subprime loan in the industry, but subprime lending is generally characterized as a lending program or strategy that targets borrowers who pose a significantly higher risk of default than traditional retail banking customers. Institutions often refer to subprime lending by other names such as the nonprime, nonconforming, high coupon, or alternative lending market.

Well-managed subprime lending can be a profitable business line; however, it is a high-risk lending activity. Successful subprime lenders carefully control the elevated credit, operating, compliance, legal, market, and reputation risks as well as the higher overhead costs associated with more labor-intensive underwriting, servicing, and collections. Subprime lending should only be conducted by institutions that have a clear understanding of the business and its inherent risks, and have determined these risks to be acceptable and controllable given the institution's staff, financial condition, size, and level of capital support. In addition, subprime lending should only be conducted within a comprehensive lending program that employs strong risk management practices to identify, measure, monitor, and control the elevated risks that are inherent in this activity. Finally, subprime lenders need to retain capital support that is consistent with the volume and nature of the additional risks assumed. If the risks associated with this activity are not properly controlled, subprime lending may be considered an unsafe and unsound banking practice.

The term, subprime, refers to the credit characteristics of the borrower at the loan's origination, rather than the type of credit or collateral considerations. Subprime borrowers typically have weakened credit histories that may include a combination of payment delinquencies, charge-offs, judgments, and bankruptcies. They may also display reduced repayment capacity as measured by credit scores, debt-to-income ratios, or other criteria. Generally, subprime borrowers will display a range of credit risk characteristics that may include one or more of the following:

- Two or more 30-day delinquencies in the last 12 months, or one or more 60-day delinquencies in the last 24 months;
- Judgment, foreclosure, repossession, or charge-off in the prior 24 months;
- Bankruptcy in the last 5 years;
- Relatively high default probability as evidenced by, for example, a Fair Isaac and Co. risk score (FICO) of 660 or below (depending on the product/collateral), or other bureau or proprietary scores with an equivalent default probability likelihood; and/or
- Debt service-to-income ratio of 50 percent or greater, or otherwise limited ability to cover family living expenses after deducting total monthly debt-service requirements from monthly income.

This list is illustrative rather than exhaustive and is not meant to define specific parameters for all subprime borrowers. Additionally, this definition may not match all market or institution-specific subprime definitions, but should be viewed as a starting point from which examiners should expand their review of the institution's lending program.

Subprime lenders typically use the criteria above to segment prospects into subcategories such as, for example, A, B, C, and D. However, subprime subcategories can vary significantly among lenders based on the credit grading criteria. What may be an "A" grade definition at one institution may be a "B" grade at another institution, but generally each grade represents a different level of credit risk.

While the industry often includes borrowers with limited or no credit histories in the subprime category, these borrowers can represent a substantially different risk profile than those with a derogatory credit history and are not inherently considered subprime. Rather, consideration should be given to underwriting criteria and portfolio performance when determining whether a portfolio of loans to borrowers with limited credit histories should be treated as subprime for examination purposes.

Subprime lending typically refers to a lending program that targets subprime borrowers. Institutions engaging in subprime lending generally have knowingly and purposefully focused on subprime lending through planned business strategies, tailored products, and explicit borrower targeting. An institution's underwriting guidelines and target markets should provide a basis for determining whether it should be considered a subprime lender. The average credit risk profile of subprime loan programs will exhibit the credit risk characteristics listed above, and will likely display significantly higher delinquency and/or loss rates than prime portfolios. High interest rates and fees are a common and relatively easily identifiable characteristic of subprime lending. However, high interest rates and fees by themselves do not constitute subprime lending.

Subprime lending does not include traditional consumer lending that has historically been the mainstay of community banking, nor does it include making loans to subprime borrowers as discretionary exceptions to the institution's prime retail lending policy. In addition, subprime lending does not refer to: prime loans that develop credit problems after acquisition; loans initially extended in subprime programs that are later upgraded, as a result of their performance, to programs targeted to prime borrowers; or community development loans as defined in the CRA regulations.

For supervisory purposes, a subprime lender is defined as an insured institution or institution subsidiary that has a subprime lending program with an aggregate credit exposure greater than or equal to 25 percent of Tier 1 capital. Aggregate exposure includes principal outstanding and committed, accrued and unpaid interest, and any retained residual assets relating to securitized subprime loans.

Capitalization

The FDIC's minimum capital requirements generally apply to portfolios that exhibit substantially lower risk profiles than exist in subprime loan programs. Therefore, these requirements may not be sufficient to reflect the risks associated with subprime portfolios. Each subprime lender is responsible for quantifying the amount of capital needed to offset the additional risk in subprime lending activities, and for fully documenting the methodology and analysis supporting the amount specified.

Examiners will evaluate the capital adequacy of subprime lenders on a case-by-case basis, considering, among other factors, the institution's own documented analysis of the capital needed to support its subprime lending activities. Capital levels are typically risk sensitive, that is, allocated capital should reflect the level and variability of loss estimates within reasonably conservative parameters. Institutions generally specify a direct link between the estimated loss rates used to determine an appropriate ALLL, and the unexpected loss estimates used to determine capital.

The sophistication of this analysis should be commensurate with the size, concentration level, and relative risk of the institution's subprime lending activities and consider the following elements:

- Portfolio growth rates;
- Trends in the level and volatility of expected losses;
- The level of subprime loan losses incurred over one or more economic downturns, if such data/analyses are available;
- The impact of planned underwriting or marketing changes on the credit characteristics of the portfolio, including the relative levels of risk of default, loss in the event of default, and the level of classified assets;
- Any deterioration in the average credit quality over time due to adverse selection or retention;
- The amount, quality, and liquidity of collateral securing the individual loans;
- Any asset, income, or funding source concentrations;
- The degree of concentration of subprime credits;
- The extent to which current capitalization consists of residual assets or other potentially volatile components;
- The degree of legal and/or reputation risk associated with the subprime business line(s) pursued; and
- The amount of capital necessary to support the institution's other risks and activities.

Given the higher risk inherent in subprime lending programs, examiners should reasonably expect, as a starting point, that an institution would hold capital against such portfolios in an amount that is one and one half to three times greater than what is appropriate for non-subprime assets of a similar type. Refinements typically depend on the factors analyzed above, with particular emphasis on the trends in the level and volatility of loss rates, and the amount, quality, and liquidity of collateral securing the loans. Institutions with significant subprime programs generally have capital ratios that are well above the averages for their traditional peer groups or other similarly situated institutions that are not engaged in subprime lending.

Some subprime asset pools warrant increased supervisory scrutiny and monitoring, but not necessarily additional capital. For example, well-secured loans to borrowers who are slightly below what is considered prime quality may entail minimal additional risks compared to prime loans, and may not require additional capital if adequate controls are in place to address the additional risks. On the other hand, institutions that underwrite higher-risk subprime pools, such as unsecured loans or high loan-to-value second mortgages, may need significantly higher levels of capital, perhaps as high as 100% of the loans outstanding depending on the level and volatility of risk. Because of the higher inherent risk levels and the increased impact that subprime portfolios may have on an institution's overall capital, examiners should document and reference each institution's subprime capital evaluation in their comments and conclusions regarding capital adequacy.

Stress Testing

An institution's capital adequacy analysis typically includes stress testing as a tool for estimating unexpected losses in its subprime lending pools. Institutions may project the performance of their subprime loan pools under conservative stress test scenarios, including an estimation of the portfolio's susceptibility to deteriorating economic, market, and business conditions. Portfolio stress testing scenarios may include "shock" testing of basic assumptions such as delinquency rates, loss rates, and recovery rates on collateral. It may also consider other potentially adverse scenarios, such as: changing attrition or prepayment rates; changing utilization rates for revolving products; changes in credit score distribution; and changes in the capital markets demand for whole loans, or asset-backed securities supported by subprime loans.

These are representative examples. Actual factors will vary by product, market segment, and the size and complexity of the portfolio relative to the institution's overall operations. Whether stress test scenarios are performed manually, or through automated modeling techniques, the Regulatory Agencies will expect that:

- The process is clearly documented, rational, and easily understood by the board and senior management;
- The inputs are reliable and relate directly to the subject portfolios;
- Assumptions are well documented and conservative; and
- Any models are subject to a comprehensive validation process.

The results of the stress test exercises should be a documented factor in the analysis and determination of capital adequacy for the subprime portfolios.

Institutions that engage in subprime lending without adequate procedures to estimate and document the level of capital necessary to support their activities should be criticized. Where capital is deemed inadequate to support the risk in subprime lending activities, examiners should consult with their Regional Office to determine the appropriate course of action.

Risk Management

The following items are essential components of an effective risk management program for subprime lenders.

Planning and Strategy. Prior to engaging in subprime lending, the board and management ensure that proposed activities are consistent with the institution's overall business strategy and risk tolerances, and that all involved parties have properly acknowledged and addressed critical business risk issues. These issues include the costs associated with attracting and retaining qualified personnel, investments in the technology necessary to manage a more complex portfolio, a clear solicitation and origination strategy that allows for after-the-fact assessment of underwriting performance, and establishing appropriate feedback and control systems. Appropriate risk assessment processes extend beyond credit risk and appropriately incorporate operating, compliance, market, liquidity, reputation and legal risks.

Institutions establishing an appropriate subprime lending program proceed slowly and cautiously into this activity to minimize the impact of unforeseen personnel, technology, or internal control problems and to determine if favorable initial profitability estimates are realistic and sustainable. Strategic plan performance analysis is generally conducted frequently in order to detect adverse trends or circumstances and take appropriate action in a timely manner.

Management and Staff. Prior to engaging in subprime lending, the board typically ensures that management and staff possess sufficient expertise to appropriately manage the risks in subprime lending and that staffing levels are adequate for the planned volume of activity. Subprime lending requires specialized knowledge and skills that many financial institutions may not possess. Marketing, account origination, and collections strategies and techniques often differ from those employed for prime credit; thus it is generally not sufficient to have the same staff responsible for both subprime and prime loans. Servicing and collecting subprime loans can be very labor intensive and requires a greater volume of staff with smaller caseloads. Lenders should monitor staffing levels, staff experience, and the need for additional training as performance is assessed over time. Compensation programs should not depend primarily on volume or growth targets. Any targets used should be weighted towards factors such as portfolio quality and risk-adjusted profitability.

Lending Policies and Procedures. Lenders typically have comprehensive written policies and procedures, specific to each subprime lending product that set limits on the amount of risk that will be assumed and address how the institution will control portfolio quality and avoid excessive exposure. Prudent institutions implement policies and procedures before initiating the activity. Institutions may originate subprime loans through a variety of channels, including dealers, brokers, correspondents, and marketing firms. Regardless of the source, it is critical that underwriting policies and procedures incorporate the risk tolerances established by the board and management and explicitly define underwriting criteria and exception processes. Subprime lending policies and procedures typically address the items outlined in the loan reference module of the ED Modules for subprime lending. If the institution elects to use scoring systems for approvals or pricing, the model should be tailored to address the behavioral and credit characteristics of the subprime population targeted and the products offered. It is generally not acceptable to rely on models developed for standard risk borrowers or products. Furthermore, the models should be reviewed frequently and updated as necessary to ensure assumptions remain valid.

Given the higher credit risk associated with the subprime borrower, effective subprime lenders use mitigating underwriting guidelines and risk-based pricing to reduce the overall risk of the loan. These guidelines include lower loan-to-value ratio requirements and lower maximum loan amounts relative to each risk grade within the portfolio. Given the high-risk nature of subprime lending, the need for thorough analysis and documentation is heightened relative to prime lending. Compromises in analysis or documentation can substantially increase the risk and severity of loss. In addition, successful subprime lenders develop criteria for limiting the risk profile of borrowers selected, giving consideration to factors such as the frequency, recency, and severity of delinquencies and derogatory items; length of time with re-established credit; and reason for the poor credit history.

Since the past credit deficiencies of subprime borrowers reflect a higher risk profile, appropriate subprime loan programs are based upon the borrowers' current reasonable ability to repay and a prudent debt amortization schedule. Loan repayment should not be based upon foreclosure proceedings or collateral repossession. Institutions are to recognize the additional default risks and determine if these risks are acceptable and controllable without resorting to foreclosure or repossession that could have been predetermined by the loan structure at inception.

Profitability and Pricing. A key consideration for lenders in the subprime market is the ability to earn risk-adjusted yields that appropriately compensate the institution for the increased risk and costs assumed. Successful institutions have a comprehensive framework for pricing decisions and profitability analysis that considers all costs associated with each subprime product, including origination, administrative/servicing, expected charge-offs, funding, and capital. In addition, such pricing frameworks allow for fluctuations in the economic cycle. Fees often comprise a significant portion of revenue in subprime lending. Consideration should be given to the portion of revenues derived from fees and the extent to which the fees are a recurring and viable source of revenue. Profitability projections typically are incorporated into the business plan. Also, effective management teams track actual performance against projections regularly and have a process for addressing variances.

Loan Review and Monitoring. Consistent with the safety and soundness standards prescribed in Appendix A to Part 364 of the FDIC Rules and Regulations, institutions must have comprehensive analysis and information systems that identify, measure, monitor and control the risks associated with subprime lending. Such analysis promotes understanding of the portfolio and early identification of adverse quality/performance trends. Systems employed must possess the level of detail necessary to properly evaluate subprime activity. Examples of portfolio segmentation and trend analyses are discussed in the subprime lending loan reference module of the ED Modules.

Comprehensive analysis considers the effects of portfolio growth and seasoning, which can mask true performance by distorting delinquency and loss ratios. Vintage, lagged delinquency, and lagged loss analysis methods are sometimes used to account for growth, seasoning, and changes in underwriting. Analysis should also take into account the effect of cure programs on portfolio performance. Refer to the glossary of the Credit Card Specialty Bank Examination Guidelines for definitions of vintage, roll rate, and migration analysis.

Servicing and Collections. Defaults occur sooner and in greater volume than in prime lending; thus a well-developed servicing and collections function is essential for the effective management of subprime lending. Strong procedures and controls are necessary throughout the servicing process; however, particular attention is warranted in the areas of new loan setup and collections to ensure the early intervention necessary to properly manage higher risk borrowers. Prudent lenders also have well-defined written collection policies and procedures that address default management (e.g., cure programs and repossessions), collateral disposition, and strategies to minimize delinquencies and losses. This aspect of subprime lending is very labor intensive but critical to the program's success.

Cure programs include practices such as loan restructuring, re-aging, renewal, extension, or consumer credit counseling. Cure programs typically are used only when the institution has substantiated the customer's renewed willingness and ability to pay. Appropriate controls help ensure cure programs do not mask poor initial credit risk selection or defer losses. Effective subprime lenders may use short-term loan restructure programs to assist borrowers in bringing loans current when warranted, but will often continue to report past due status on a contractual basis. Cure programs that alter the contractual past due status may mask actual portfolio performance and inhibit the ability of management to understand and monitor the true credit quality of the portfolio.

Repossession and resale programs are integral to the subprime business model. Policies and procedures for foreclosure and repossession activities typically specifically address the types of cost/benefit analysis to be performed before pursuing collateral, including valuation methods employed; timing of foreclosure or repossession; and accounting and legal requirements. Effective policies clearly outline whether the institution will finance the sale of the repossessed collateral, and if so, the limitations that apply. Institutions that track the performance of such loans are able to assess the adequacy of these policies.

Compliance and Legal Risks. Subprime lenders generally run a greater risk of incurring legal action given the higher fees, interest rates, and profits; targeting customers who have little experience with credit or damaged credit records; and aggressive collection efforts. Because the risk is dependent, in part, upon the public perception of a lender's practices, the nature of these risks is inherently unpredictable. Institutions that engage in subprime lending must take special care to avoid violating consumer protection laws. An adequate compliance management program must identify, monitor and control the consumer protection hazards associated with subprime lending. The institution should have a process in place to handle the potential for heightened legal action. In addition, management should have a system in place to monitor consumer complaints for recurring issues and ensure appropriate action is taken to resolve legitimate disputes.

Audit. The institution's audit scope should provide for comprehensive independent reviews of subprime activities. Appropriate audit procedures include, among other things, a sample of a sufficient volume of accounts to verify the integrity of the records, particularly with respect to payments processing.

Third Parties. Subprime lenders may use third parties for a number of functions from origination to collections. In dealing with high credit-risk products, effective management teams take steps to ensure that exposures from third-party practices or financial instability are minimized. This includes proper due diligence performed prior to contracting with a third party vendor and on an ongoing basis. Appropriate contracts provide the institution with the ability to control and monitor third party activities (e.g. growth restrictions, underwriting guidelines, outside audits, etc.) and discontinue relationships that prove detrimental to the institution.

Special care must be taken when purchasing loans from third party originators. Some originators who sell subprime loans charge borrowers high up-front fees, which may be financed into the loan. These fees provide incentive for originators to produce a high volume of loans with little emphasis on quality, to the detriment of a potential purchaser. These fees also increase the likelihood that the originator will attempt to refinance the loans. Appropriate contracts restrict the originator from the churning of customers. Further, subprime loans, especially those purchased from outside the institution's lending area, are at special risk for fraud or misrepresentation. Effective management also ensures that third party conflicts of interest are avoided. For example, if a loan originator provides recourse for poorly performing loans purchased by the institution, the originator or related interest thereof should not also be responsible for processing and determining the past due status of the loans.

Securitizations. Securitizing subprime loans carries inherent risks, including interim credit, liquidity, interest rate, and reputation risk, that are potentially greater than those for securitizing prime loans. The subprime loan secondary market can be volatile, resulting in significant liquidity risk when originating a large volume of loans intended for securitization and sale. Investors can quickly lose their appetite for risk in an economic downturn or when financial markets become volatile. As a result, institutions may be forced to sell loan pools at deep discounts. If an institution lacks adequate personnel, risk management procedures, or capital support to hold subprime loans originally intended for sale, these loans may strain an institution's liquidity, asset quality, earnings, and capital. Consequently, institutions actively involved in the securitization and sale of subprime loans typically develop a contingency plan that addresses back-up purchasers of the securities, whole loans, or the attendant servicing functions, alternate funding sources, and measures for raising additional capital. An institution's liquidity and funding structure should not be overly dependent upon the sale of subprime loans.

Given some of the unique characteristics of subprime lending, accounting for the securitization process requires assumptions that can be difficult to quantify reliably, and erroneous assumptions can lead to the significant overstatement of an institution's assets. Prudent institutions take a conservative approach when accounting for these transactions and ensure compliance with existing regulatory guidance. Refer to outstanding examination instructions for further information regarding securitizations.

Classification

The Uniform Retail Credit Classification and Account Management Policy (Retail Classification Policy) governs the evaluation of consumer loans. This policy establishes general classification thresholds based on delinquency, but also grants examiners the discretion to classify individual retail loans that exhibit signs of credit weakness regardless of delinquency status. An examiner may also classify retail portfolios, or segments thereof, where underwriting standards are weak and present unreasonable credit risk, and may criticize account management practices that are deficient. Given the high-risk nature of subprime portfolios and their greater potential for loan losses, the delinquency thresholds for classification set forth in the Retail Classification Policy should be considered minimums. Well-managed subprime lenders recognize the heightened risk-of-loss characteristics in their portfolios and, if warranted, internally classify their delinquent accounts well before the timeframes outlined in the interagency policy. If examination classifications are more severe than the Retail Classification Policy suggests, the examination report should explain the weaknesses in the portfolio and fully document the methodology used to determine adverse classifications.

ALLL Analysis

An institution's appropriately documented ALLL analysis identifies subprime loans as a specific risk exposure separate from the prime portfolio. In addition, the analysis segments the subprime lending portfolios by risk exposure such as specific product, vintage, origination channel, risk grade, loan to value ratio, or other grouping deemed relevant.

Adversely classified subprime loans (to include, at a minimum, all loans past due 90 days or more) should be reviewed for impairment, and an appropriate allowance should be established consistent with accounting requirements. For subprime loans that are not adversely classified, the ALLL should be sufficient to absorb at least all estimated credit losses on outstanding balances over the current operating cycle, typically 12 months. To the extent that the historical net charge-off rate is used to estimate credit losses, it should be adjusted for changes in trends, conditions, and other relevant factors, including business volume, underwriting, risk selection, account management practices, and current economic or business conditions that may alter such experience.

Subprime Auto Lending

Underwriting. Subprime auto lenders use risk-based pricing of loans in addition to more stringent advance rates, discounting, and dealer reserves than those typically used for prime auto loans to mitigate the increased credit risk. As credit risk increases, advance rates on collateral decrease while interest rates, dealer paper discounts, and dealer reserves increase. In addition to lower advance rates, collateral values are typically based on the wholesale value of the car. Lenders will typically treat a new dealer with greater caution, using higher discounts and/or purchasing the dealer's higher quality paper until a database and working relationship is developed.

Servicing and Collections. Repossession is quick, generally ranging between 30 to 60 days past due and sometimes earlier. The capacity of a repossession and resale operation operated by a prime lender could easily be overwhelmed if the lender begins targeting subprime borrowers, leaving the lender unable to dispose of cars quickly. Resale methods include wholesale auction, retail lot sale, and/or maintaining a database of retail contacts. While retail sale will command a greater price, subprime lenders may consider limiting the time allocated to retail sales before sending cars to auction in order to ensure adequate cash flow and avoid excessive inventory build-up. Refinancing resales are usually limited and tightly controlled, as this practice can mask losses. Lenders typically implement a system for tracking the location of the collateral.

Subprime Residential Real Estate Lending

Underwriting. To mitigate the increased risk, subprime residential real estate lenders use risk-based pricing in addition to more conservative LTV ratio requirements and cash-out restrictions than those typically used for prime mortgage loans. As the credit risk of the borrower increases, the interest rate increases and the loan-to-value ratio and cash-out limit decreases. Prudent loan-to-value ratios are an essential risk mitigant in subprime real estate lending and generally range anywhere from 85 percent to 90 percent for A- loans, to 65 percent for lower grades. High loan-to-value (HLTV) loans are generally not considered prudent in subprime lending. HLTV loans should be targeted at individuals who warrant large unsecured debt, and then only in accordance with outstanding regulatory guidance. The appraisal process takes on increased importance given the greater emphasis on collateral. Prepayment penalties are sometimes used on subprime real estate loans, where allowed by law, given that prepayment rates are generally higher and more volatile for subprime real estate loans. Government Sponsored entities, Fannie Mae and Freddie Mac, have participated in the subprime mortgage market to a limited degree through purchases of subprime loans and guarantees of subprime securitizations.

Servicing and Collections. Collection calls begin early, generally within the first 10 days of delinquency, within the framework of existing laws. Lenders generally send written correspondence of intent to foreclosure or initiate other legal action early, often as early as 31 days delinquent. The foreclosure process is generally initiated as soon as allowed by law. Updated collateral valuations are typically obtained early in the collections process to assist in determining appropriate collection efforts. Frequent collateral inspections are often used by lenders to monitor the condition of the collateral.

Subprime Credit Card Lending

Underwriting. Subprime credit card lenders use risk-based pricing as well as tightly controlled credit limits to mitigate the increased credit risk. In addition, lenders may require full or partial collateral coverage, typically in the form of a deposit account at the institution, for the higher-risk segments of the subprime market. Initial credit lines are set at low levels, such as $300 to $1,000, and subsequent line increases are typically smaller than for prime credit card accounts. Increases in credit lines should be subject to stringent underwriting criteria similar to that required at origination.

Underwriting for subprime credit cards is typically based upon credit scores generated by sophisticated scoring models. These scoring models use a substantial number of attributes, including the frequency, severity, and recency of previous delinquencies and major derogatory items, to determine the probability of loss for a potential borrower. Subprime lenders typically target particular subprime populations through prescreening models, such as individuals who have recently emerged from bankruptcy. Review of the attributes in these models often reveals the nature of the institution's target population.

Servicing and Collections. Lenders continually monitor customer behavior and credit quality and take proactive measures to avert potential problems, such as decreasing or freezing credit lines or providing consumer counseling, before the problems become severe or in some instances before the loans become delinquent. Lenders often use sophisticated scoring systems to assist in monitoring credit quality and frequently re-score customers. Collection calls on delinquent loans begin early, generally within the first 10 days delinquent, and sometimes as early as 1-day delinquent, within the framework of existing laws. Lenders generally send written correspondence within the first 30 days in addition to calling. Account suspensions occur early, generally within the first 45 days of delinquency or immediately upon a negative event such as refusal to pay. Accounts over 90 days past due are generally subject to account closure and charge-off. In addition, account closures based upon a borrower's action, such as repeated refusal to pay or broken promises to bring the account current within a specified time frame, may occur at any time in the collection process. Account closure practices are generally more aggressive for relatively new credit card accounts, such as those originated in the last six months.

Payday Lending

Payday lending is a particular type of subprime lending. Payday loans (also known as deferred deposit advances) are small dollar, short-term, unsecured loans that borrowers promise to repay out of their next paycheck or regular income payment (such as social security check). Payday loans are usually priced at a fixed dollar fee, which represents the finance charge. Because these loans have such short terms to maturity, the cost of borrowing, expressed as an annual percentage rate is very high.

In return for the loan, the borrower usually provides the lender with a check or debit authorization for the amount of the loan plus the fee. The check is either post-dated to the borrower's next payday or the lender agrees to defer presenting the check for payment until a future date, usually two weeks or less. When the loan is due, the lender expects to collect the loan by depositing the check or debiting the borrower's account or by having the borrower redeem the check with a cash payment. If the borrower informs the lender that he or she does not have the funds to repay the loan, the loan is often refinanced (payday lenders may use the terms "rollover," "same day advance," or "consecutive advance") through payment of an additional finance charge. If the borrower does not redeem the check in cash and the loan is not refinanced, the lender normally puts the check or debit authorization through the payment system. If the borrower's deposit account has insufficient funds, the borrower typically incurs a NSF charge on this account. If the check or the debit is returned to the lender unpaid, the lender also may impose a returned item fee plus collection charges on the loan.

Significant Risks

Credit Risk. Borrowers who obtain payday loans generally have cash flow difficulties and few, if any, lower-cost borrowing alternatives. In addition, some payday lenders perform minimal analysis of the borrower's ability to repay either at the loan's inception or upon refinancing; they may merely require a current pay stub or proof of a regular income source and evidence that the customer has a checking account. Other payday lenders use scoring models and consult nationwide databases that track bounced checks and persons with outstanding payday loans. However, payday lenders typically do not obtain or analyze information regarding the borrower's total level of indebtedness or information from the major national credit bureaus. The combination of the borrower's limited financial capacity, the unsecured nature of the credit, and the limited underwriting analysis of the borrower's ability to repay pose substantial credit risk for insured depository institutions.

Legal and Reputation Risk**.** Federal law authorizes Federal and state-chartered insured depository institutions making loans to out-of-state borrowers to "export" favorable interest rates provided under the laws of the State where the institution is located. That is, a state-chartered institution is allowed to charge interest on loans to out-of-state borrowers at rates authorized by the State where the institution is located, regardless of usury limitations imposed by the State laws of the borrower's residence. Nevertheless, institutions face increased reputation risk when they enter into certain arrangements with payday lenders, including arrangements to originate loans on terms that could not be offered directly by the payday lender.

Transaction Risk**.** Payday loans are a form of specialized lending not typically found in state nonmember institutions, and are most frequently originated by specialized nonbank firms subject to State regulation. Payday loans can be subject to high levels of transaction risk given the large volume of loans, the handling of documents, and the movement of loan funds between the institution and any third party originators. Because payday loans may be underwritten off-site, there also is the risk that agents or employees may misrepresent information about the loans or increase credit risk by failing to adhere to established underwriting guidelines.

Third-Party Risk**.** Insured depository institutions may have payday lending programs that they administer directly, using their own employees, or they may enter into arrangements with third parties. In the latter arrangements, the institution typically enters into an agreement in which the institution funds payday loans originated through the third party. These arrangements also may involve the sale to the third party of the loans or servicing rights to the loans. Institutions also may rely on the third party to provide additional services that the institution would normally provide, including collections, advertising and soliciting applications. The existence of third party arrangements may, when not properly managed, significantly increase institutions' transaction, legal, and reputation risks.

Arrangements with third parties should be guided by written contract and approved by the institution's board. The arrangement typically:

- Describe the duties and responsibilities of each party, including the scope of the arrangement;
- Specify that the third party will comply with all applicable laws and regulations;
- Specify which party will provide consumer compliance related disclosures;
- Authorize the institution to monitor the third party and periodically review and verify that the third party and its representatives are complying with its agreement with the institution;
- Authorize the institution and the appropriate banking agency to have access to such records of the third party and conduct onsite transaction testing and operational reviews at the third party locations as necessary or appropriate to evaluate such compliance;
- Require the third party to indemnify the institution for potential liability resulting from action of the third party with regard to the payday lending program; and
- Address customer complaints, including any responsibility for third-party forwarding and responding to such complaints.

Effective bank management sufficiently monitors the third party with respect to its activities and performance. Bank management dedicates sufficient staff with the necessary expertise to oversee the third party. The institution's oversight program includes monitoring the third party's financial condition, its controls, and the quality of its service and support, including its resolution of consumer complaints if handled by the third party. Oversight programs that are documented sufficiently facilitate the monitoring and management of the risks associated with third-party relationships.

Concentrations

Given the risk inherent in payday lending, concentrations of credit in this line of business pose a significant safety and soundness concern. In the context payday lending, a concentration would be defined as a volume of payday loans totaling 25 percent or more of an institution's Tier 1 capital. Where concentrations of payday lending are noted, institution management should be criticized for a failure to diversify risks. Appropriate supervisory action may be necessary to address concentrations, including directing the institution to reduce its loans to an appropriate level, or raising additional capital.

Capital Adequacy

Payday lending is among the highest risk subsets of subprime lending, and significantly higher levels of capital than the starting point for subprime loans - one and a half to three times what is appropriate for nonsubprime assets of a similar type – typically is required. Institutions that underwrite payday loans may be required to maintain as high as one hundred percent of the loans outstanding (dollar-for-dollar capital), depending on the level and volatility of risk. Risks to consider when determining capital requirements include the unsecured nature of the credit, the relative levels of risk of default, loss in the event of default, and the level of classified assets. The degree of legal or reputation risk associated with payday lending should also be considered, especially as it relates to third party agreements.

Allowance for Loan and Lease Losses

As with other loan types, institutions should maintain an ALLL that is appropriate to absorb estimated credit losses with the payday portfolio. Although the contractual term of each payday loan may be short, institutions' methodologies for estimating credit losses on these loans should take into account the fact that many payday loans remain continuously outstanding for longer periods because of renewals and rollovers. In addition, institutions should evaluate the collectibility of accrued fees and finance charges on payday loans and employ appropriate methods to ensure that income is accurately measured.

Classifications

The Retail Classification Policy establishes general classification thresholds for consumer loans based on delinquency, but also grants examiners the discretion to classify individual retail loans that exhibit signs of credit weakness regardless of delinquency status. Examiners also may classify retail portfolios, or segments thereof, where underwriting standards are weak and present unreasonable credit risk, and may criticize account management practices that are deficient.

Most payday loans have well-defined weaknesses that jeopardize the liquidation of the debt. Weaknesses include limited or no analysis of repayment capacity and the unsecured nature of the credit. In addition, payday loan portfolios are characterized by a marked proportion of obligors whose paying capacity is questionable. As a result of these weaknesses, payday loan portfolios are typically classified Substandard.

Furthermore, payday loans that have been outstanding for extended periods of time evidence a high risk of loss. While such loans may have some recovery value, it is not practical or desirable to defer writing off these essentially worthless assets. Payday loans that are outstanding for greater than 60 days from origination generally meet the definition of Loss. In certain circumstances, earlier charge-off may be appropriate (e.g., the institution does not renew beyond the first payday and the borrower is unable to pay, the institution closes an account). The institution's policies regarding consecutive advances also should be considered when determining Loss classifications. Where the economic substance of consecutive advances is substantially similar to "rollovers" – without appropriate "cooling off" or waiting periods – examiners should treat these loans as continuous advances and classify accordingly.

Examiners would normally not classify loans for which the institution has documented adequate paying capacity of the obligors and/or sufficient collateral protection or credit enhancement.

Renewals/Rewrites

The Retail Classification Policy establishes guidelines for extensions, deferrals, renewals, or rewrites of closed-end accounts. Despite the short-term nature of payday loans, borrowers that request an extension, deferral, renewal, or rewrite should exhibit a renewed willingness and ability to repay the loan. Institutions can refer to the Retail Classification Policy standards that control the use of extensions, deferrals, renewals, or rewrites of payday loans. In consideration of the Retail Classification Policy, institutions' standards typically:

- Limit the number and frequency of extensions, deferrals, renewals, and rewrites;
- Prohibit additional advances to finance unpaid interest and fees and simultaneous loans to the same customer; and
- Ensure that comprehensive and effective risk management, reporting, and internal controls are established and maintained.

In addition to the above items, prudent institutions also:

- Establish appropriate "cooling off" or waiting periods between the time a payday loan is repaid and another application is made:
- Establish the maximum number of loans per customer that are allowed within one calendar year or other designated time period; and
- Provide that no more than one payday loan is outstanding with the institution at a time to any one borrower.

Accrued Fees and Finance Charges

It is important for institutions to evaluate the collectibility of accrued fees and finance charges on payday loans because a portion of accrued interest and fees is generally not collectible. Although regulatory reporting instructions do not require payday loans to be placed on nonaccrual based on delinquency status, institutions should employ appropriate methods to ensure that income is accurately measured. Such methods may include providing loss allowances for uncollectible fees and finance charges or placing delinquent and impaired receivables on nonaccrual status. After a loan is placed on nonaccrual status, subsequent fees and finance charges imposed on the borrower would not be recognized in income and accrued, but unpaid fees and finance charges normally would be reversed from income.

INTRODUCTION

Overview

Securities and end-user derivatives (investment) activities can provide banks with earnings, liquidity, and capital appreciation. Carefully constructed positions can also reduce overall bank risk exposures. However, investment activities can also create considerable risk exposures, particularly:

- Market risk,
- Credit risk,
- Liquidity risk,
- Operating risk,
- Legal risk,
- Settlement risk, and
- Interconnection risk.

This section provides guidance, policy, and sound practices regarding:

- Policies, procedures and risk limits,
- Internal controls,
- Unsuitable investment activities,
- Risk Identification, measurement, and reporting,
- Board and senior management oversight,
- Compliance,
- Report of examination treatment, and
- Other guidance (trading, accounting, and information services).

Use this section to assess how effectively a bank's board and management identifies, measures, monitors, and controls investment activity risks. Incorporate findings into relevant examination assessments, including sensitivity to market risk, liquidity, asset quality, and management.

Refer to the Capital Markets Examination Handbook for reference information on a wide range of activities and instruments, including fixed income instruments, mutual funds, derivatives, sensitivity to market risk, portfolio management, and specialized examination procedures. That handbook's information focuses more closely on specific activities and instruments than this section's general guidance.

Policy Statement

The Supervisory Policy Statement on Investment Securities and End-User Derivatives Activities (Policy Statement) was adopted by the FDIC, Office of the Comptroller of the Currency, Board of Governors of the Federal Reserve System, Office of Thrift Supervision, and National Credit Union Administration, effective May 26, 1998. The Policy Statement provides guidance and sound principles to bankers for managing investment securities and derivatives risks. It makes clear the importance of board oversight and management supervision, and focuses on risk management. The Policy Statement covers all securities used for investment purposes and all end-user derivative instruments used for non-trading purposes. It applies to all federally-insured commercial banks, savings banks, and savings associations. Notably, the Policy Statement:

- Underscores the importance of board oversight and management supervision,
- Emphasizes effective risk management,
- Contains no specific constraints on holding "high risk" mortgage derivative products,
- Eliminates the requirement to obtain the former regulatory volatility test for mortgage derivative products, and
- Applies to all permissible investment securities and end-user derivatives.

The Policy Statement declares that banks should implement programs to manage the market, credit, liquidity, legal, operational, and other risks that result from investment activities. Adequate risk management programs identify, measure, monitor, and control these risks.

Failure to understand and adequately manage investment activity risks is an unsafe and unsound practice.

Risk Management Process Summary

This subsection provides guidance for evaluating a risk management program's effectiveness at identifying, measuring, monitoring, and controlling investment activity risks. It also includes guidance for assessing those risks relative to overall risk exposure.

Management should establish a risk management program that identifies, measures, monitors, and controls investment activity risks. Its intricacy and detail should be commensurate with the bank's size, complexity, and investment activities. Thus, the program should be tailored to the bank's needs and circumstances. Regardless, an effective risk management program will include the following processes:

- The board should adopt policies that establish clear goals and risk limits.
- The board should review and act upon management's reports.

- The board should establish an independent review function and review its reports.
- Management should develop investment strategies to achieve the board's goals.
- Management should analyze and select investments consistent with its strategies.
- Management should maintain an effective internal control program.
- Management should regularly measure the portfolio's risk levels and performance.
- Management should provide periodic reports to the board.
- The board and management should periodically evaluate and, when warranted, modify the program.

The following sections of the guidance cover each of the above steps in greater detail.

Management must determine, consistent with board policy, how investment activity risks will be managed. The Policy Statement provides considerable flexibility by permitting banks to manage risk on an individual instrument basis, on an aggregate portfolio basis, or on a whole bank basis.

Banks that engage in less complex activities may effectively manage investment activity risk on an individual instrument basis. That is, each instrument's risk and return is evaluated independently. An instrument's contribution to overall portfolio risk and return may only be considered in general terms. This approach requires rather specific individual instrument risk limits, but typically does not involve aggregate portfolio analysis.

Banks with complex or extensive investment activities should strongly consider the portfolio approach for managing investment activity risk. Under a portfolio approach, management evaluates an instrument's contribution to overall portfolio risk and return. It requires portfolio risk limits and a system for aggregating and measuring overall portfolio risk and return. More complex aggregate portfolio risk and return measurements should be incorporated into overall interest rate risk or asset/liability management programs.

In recommending that all banks *consider* portfolio or whole bank risk management, the Policy Statement notes that such approaches generally provide certain advantages over the individual instrument approach, including:

- Integrated management of risk and return
- Understanding of each instrument's contribution to overall risk and return
- Increased flexibility when selecting instruments

POLICIES, PROCEDURES, AND RISK LIMITS

Policies

The board is responsible for adopting comprehensive, written investment policies that clearly express the board's investment goals and risk tolerance. Policies should be tailored to the bank's needs and should address:

- The board's investment goals,
- Authorized activities and instruments,
- Internal controls and independent review,
- Selecting broker/dealers,
- Risk limits,
- Risk and performance measurement,
- Reporting, and
- Accounting and taxation.

At most banks, the investment portfolio serves as a secondary source of both earnings and liquidity. At some banks, the investment portfolio is a primary earnings component. The policies should articulate the investment portfolio's purpose, risk limits, and return goals. Return goals should express the board's earnings objectives for the investment portfolio. The board may also establish portfolio performance targets.

Policies should describe all authorized investment activities and set guidelines for new products or activities. Further, policies should delegate investment authority, including naming specific personnel. The board's approved policies should also provide management with general guidelines for selecting securities broker/dealers and limiting broker/dealer credit risk exposure.

The bank should have policies that ensure an understanding of the market risks associated with investment securities and derivative instruments before purchase. Accordingly, banks should have policies that define the characteristics of authorized instruments. The policy should sufficiently detail the characteristics of authorized instruments. For example, a policy that merely authorizes the purchase of agency securities would not be sufficiently detailed. The price sensitivities of agency pass-throughs, step-up structured notes, agency callable debt or leveraged inverse floaters are very different. Therefore, the policy should delineate the authorized types of agency securities that may be purchased. Management should analyze the risks in an instrument that has not been authorized and should seek the board's permission to alter the list of authorized instruments before purchase.

Banks should have policies that specify the analysis of the risk of an investment that must be conducted prior to purchase. The pre-purchase analysis is meant to discover and quantify all relevant risks in the investment. Not all investments will require pre-purchase analysis. Relatively simple or standardized instruments, the risks of which are well known to the bank, would likely require no or significantly less analysis than would more complex or volatile instruments. Policies should delineate which of the authorized investments do not require pre-purchase analysis.

The list of authorized instruments may include instruments of varying characteristics. Policies should divide the spectrum of authorized investments into segments of instruments of similar risk characteristics. Policies should also require appropriate pre-purchase analysis for each segment.

Risk Limits

To effectively oversee investment activities, the board must approve the bank's risk limits. Management should set these risk limits, consistent with the board's goals, objectives, and risk appetite. The risk limits should be formally approved and incorporated within the board's policies. Limits may be expressed in terms of bank-wide risk, investment portfolio risk, portfolio segment risk, or even individual instrument risk.

Risk limits should be consistent with the bank's strategic plans and overall asset/liability management objectives. Limits should be placed on:

- Market risk,
- Credit risk,
- Liquidity risk,
- Asset types, and
- Maturities.

At a minimum, risk limits should be expressed relative to meaningful standards, such as capital or earnings. More complex investment activities may require more detailed risk limits.

Market risk limits should at least quantify maximum permissible portfolio or individual instrument price sensitivity as percentage of capital or earnings. Capital-based risk limits clearly illustrate the potential threat to the bank's viability, while earnings-based limits reflect potential profitability effects. In addition, the board may choose to establish limits relative to earnings, total assets, total investment securities, or other standards.

Credit risk limits should generally restrict management to investment grade instruments. The board may permit management to acquire nonrated instruments; however, these instruments should be consistent with investment grade standards. For example, management may wish to purchase a nonrated bond issued by a local municipality. Regardless, the board should carefully monitor such activity.

Liquidity risk limits should restrict positions in less marketable instruments. These limits should apply to securities that management would have difficulty selling at or near fair value. Less marketable instruments may not meet the board's investment goals, and holdings should generally be small. Obscure issues, complex instruments, defaulted securities, and instruments with thin markets may all have limited liquidity.

Asset type limits should limit concentrations in specific issuers, market sectors, and instrument types. These limits will require management to diversify the portfolio. When properly diversified, a portfolio can have lower risk for a given yield or can earn a higher yield for a given risk level. For example, the board may limit total investment in a particular instrument type to a specific percentage of capital.

Maturity limits should place restrictions on the maximum stated maturity, weighted average maturity, or duration of instruments that management may purchase. Longer-term securities have greater interest rate risk, price risk, and cash flow uncertainty than shorter-term instruments possess. Therefore, maturity limits should complement market risk limits, liquidity risk limits, and the board's investment goals.

In addition, management should establish a standard risk measurement methodology. The measurement system must capture all material risks and accurately calculate risk exposures. Management should provide the board with consistent, accurate risk measurements in a format that directly illustrates compliance with the board's risk limits. Refer to the Risk and Performance Measurement subsection for additional guidance.

INTERNAL CONTROLS

Internal Control Program

Effective internal controls are the first line of defense in supervising investment activity operating risks. Ineffective controls can lead to bank failures. Consequently, examiners will carefully evaluate the internal control program. Examiners will emphasize separation of duties between the individuals who execute, settle, and account for transactions.

The internal control program should be commensurate with the volume and complexity of the investment activity conducted, and should be as independent as practical from related operations.

The board has responsibility for establishing general internal control guidelines, which management should translate into clear procedures that govern daily operations. Management's internal control program should include procedures for the following:

- Portfolio valuation,
- Personnel,
- Settlement,
- Physical control and documentation,
- Conflict of interest,
- Accounting,
- Reporting, and
- Independent review.

Internal controls should promote efficiency, reliable internal and regulatory reporting, and compliance with regulations and bank policies.

Portfolio valuation procedures should require independent portfolio pricing. The availability of independent pricing provides an effective gauge of the market depth for thinly traded instruments, allowing management to assess the potential liquidity of specific issues. For these and other illiquid or complex instruments, completely independent pricing may be difficult to obtain. In such cases, estimated or modeled values may be used. However, management should understand and agree with the methods and assumptions used to estimate value.

Personnel guidelines should require sufficient staffing resources and expertise for the bank's approved investment activities.

Settlement practices should be evaluated against the guidelines provided in the Settlement Practices, Confirmation and Delivery Requirements, and Delivery Documentation Addenda.

.

Physical control and documentation requirements should include:

- Possessing and controlling purchased instruments,
- Saving and safeguarding important documents, and
- Invoice review.

Invoice review requirements should address standards for all securities and derivatives sold or purchased. Invoices and confirmations display each instrument's original purchase price, which provides a basis to establish book value and to identify reporting errors. Invoice reviews can also be used when determining if the bank is involved in any of the following inappropriate activities:

- Engaging one securities dealer or representative for virtually all transactions.
- Purchasing from or selling to the bank's trading department.
- Unsuitable investment practices (refer to following page.).
- Inaccurate reporting.

Conflict of interest guidelines should govern all employees authorized to purchase and sell securities for the bank. These guidelines should ensure that all directors, officers, and employees act in the bank's best interest. The board should adopt polices that address authorized employees' personal relationships, including securities transactions, with the bank's approved securities broker/dealers. The board may also adopt policies that address the circumstances under which directors, officers, and employees may accept gifts, gratuities, or travel expenses from securities broker/dealers and associated personnel.

Accounting practices should be evaluated against the standards, opinions, and interpretations listed in this section.

Reporting procedures should be evaluated against the guidelines discussed in the Risk Reporting subsection Risk Identification, Assessment and Reporting.

Independent review of the risk management program should be conducted at regular intervals to ensure the integrity, accuracy, and reasonableness of the program. Independent review may encompass external audits or an internal audit program. At many banks, however, evaluation by personnel independent of the portfolio management function will suffice. The independent review program's scope and formality should correspond to the size and complexity of the bank's investment activities. Independent review of investment activity should be at least commensurate with the independent review of other primary bank activities. It should assess:

- Adherence to the board's policies and risk limits,

- The risk measurement system's adequacy and accuracy,
- The reporting system's timeliness, accuracy, and usefulness,
- Personnel resources and capabilities,
- Compliance with regulatory standards,
- The internal control environment,
- Accounting and documentation practices, and
- Conflicts of interest.

Banks with complex investment activities should consider augmenting the independent review with internal or external auditors, while banks with less complex investment activities may rely on less formal review. Sophisticated risk measurement systems, particularly those developed in-house, should be independently tested and validated.

Independent review findings should be reported directly to the board at least annually. The board should carefully review the independent review reports and ensure that material exceptions are corrected.

Examiners will evaluate the independent review's scope and veracity, and will rely on sound independent review findings during examinations. However, when the independent review is unsatisfactory, examiners will perform review procedures to reach independent conclusions. When warranted, examiners will conduct a detailed review of all investment activities.

UNSUITABLE INVESTMENT ACTIVITIES

Trading activity within the held-to-maturity (HTM) or available-for-sale (AFS) portfolio is an unsuitable investment activity and may be considered unsafe and unsound. Each of the following activities are unsuitable within the HTM or AFS portfolio, and any resulting securities acquisitions should be reported as trading assets. The bank's internal control program should be designed to prevent the following unsuitable investment activities:

- Gains trading,
- When-issued securities,
- Pair-offs,
- Extended settlement,
- Repositioning repurchase agreement, and
- Adjusted trading.

Gains trading is the purchase and subsequent sale of a security at a profit after a short holding period, while securities acquired for this purpose that cannot be sold at a profit are retained in the AFS or HTM portfolio. Gains trading may be intended to defer loss recognition, as unrealized losses on debt securities in such categories do not directly affect regulatory capital and generally are not reported in income until the security is sold.

Examiners should scrutinize institutions with a pattern of reporting significant amounts of realized gains on sales of non-trading securities (typically, AFS securities) after short holding periods while continuing to hold other non-trading securities with significant amounts of unrealized losses. If, in the examiner's judgment, such a practice has occurred, the examiner should consult with the Regional Office for additional guidance on whether some or all of the securities reported outside of the trading category will be designated as trading assets.

When-issued securities trading is the buying and selling of securities in the period between the announcement of an offering and the issuance and payment date of the securities. A purchaser of a when-issued security acquires the risks and rewards of owning a security and may sell the when-issued security at a profit before having to take delivery and pay for it.

Pair-offs are security purchase transactions that are closed-out or sold at or before the settlement date. In a pair-off, an institution commits to purchase a security. Then, before the predetermined settlement date, the bank pairs-off the purchase with a sale of the same security. Pair-offs are settled net when one party to the transaction remits the difference between the purchase and sale price to the counterparty. Pair-offs may also involve the same sequence of events using swaps, options on swaps, forward commitments, options on forward commitments, or other off-balance sheet derivative contracts.

Extended Settlement is the use of a securities trade settlement period in excess of the regular-way settlement period. Regular-way settlement for U.S. Government and Federal agency securities (except mortgage-backed securities and derivative contracts) is one business day after the trade date. Regular-way settlement for corporate and municipal securities is three business days after the trade date, and for mortgage-backed securities it can be up to 60 days or more after the trade date. The use of a settlement period in excess of the regular-way settlement period to facilitate speculation is considered a trading activity.

A **repositioning repurchase agreement** is offered by a dealer to allow an institution that has entered into a when-issued trade or a pair-off (which may include an extended settlement) that cannot be closed out at a profit on the payment or settlement date to hold its **speculative** position until the security can be sold at a gain. The institution purchasing the security pays the dealer a small margin that approximates the actual loss in the security. The dealer then agrees to fund the purchase of the security by buying it back from the purchaser under a resale agreement. Any securities acquired through a dealer financing technique such as a repositioning repurchase agreement that is used to fund the speculative purchase of securities should be reported as trading assets.

A **short sale** is the sale of a security that is not owned. The purpose of a short sale generally is to speculate on a fall in the price of the security. Short sales should be conducted in the trading portfolio. A short sale that involves the delivery of the security sold short by borrowing it from the depository institution's AFS or HTM portfolio should not be reported as a short sale. Instead, it should be reported as a sale of the underlying security with gain or loss recognized in current earnings.

Adjusted trading involves the sale of a security to a broker or dealer at a price above the prevailing market value and the simultaneous purchase and booking of a different security, frequently a lower rated or quality issue or one with a longer maturity, at a price above its market value. Thus, the dealer is reimbursed for losses on the purchase from the institution and ensured a profit. Such transactions inappropriately defer the recognition of losses on the security sold and establish an excessive cost basis for the newly acquired security. Consequently, such transactions are prohibited and may be in violation of 18 U.S.C. Sections 1001-False Statements or Entries and 1005-False Entries.

RISK IDENTIFICATION, MEASUREMENT, AND REPORTING

Risk Identification

All investment activities create risk exposures, but the risk types and levels depend upon the activity conducted. The following guidance summarizes the major risk exposures. Refer to the Capital Markets Examination Handbook for additional guidance on specific instruments, markets, and strategies.

Market risk is the possibility that an instrument will lose value due to a change in the price of an underlying instrument, change in the value of an index of financial instruments, changes in various interest rates, or other factors. Frequently, an instrument will increase a bank's market risk due to price volatility, embedded options, leverage factors, or other structural factors. The three principal types of market risk are price risk, interest rate risk and basis risk.

<u>Price risk</u> is the possibility that an instrument's price fluctuation will unfavorably affect income, capital, or risk reduction strategies. Price risk is usually influenced by other risks. For example, a bond's price risk could be a function of rising interest rates, while a currency-linked note's price risk could be a function of devaluation in the linked currency.

<u>Interest rate risk</u> is the possibility that an instrument's value will fluctuate in response to current or expected market interest rate changes.

<u>Yield curve risk</u> is the possibility that an instrument's value will fluctuate in response to a nonparallel yield curve shift. Yield curve risk is a form of interest rate risk.

<u>Basis risk</u> is the possibility that an instrument's value will fluctuate at a rate that differs from the change in value of a related instrument. For example, three-month Eurodollar funding is not perfectly correlated with Treasury bill yields. This imperfect correlation between funding cost and asset yield creates basis risk.

Credit risk is the possibility of loss due to a counterparty's or issuer's default, or inability to meet contractual payment terms. The amount of credit risk equals the replacement cost (also referred to as *current exposure*) of an identical instrument. The replacement cost is established by assessing the instrument's current market value rather than its value at inception.

In addition, default exposes a bank to market risk. After default, losses on a now unhedged position may occur before the defaulted hedge instrument can be replaced. Such losses would have been largely (or completely) offset if the counterparty had not defaulted.

Exchange-traded derivatives (futures, options, and options on futures) contain minimal credit risk. These instruments are marked-to-market at the end of each trading day, or on an intra-day basis, by the exchange clearinghouse. Position value changes are settled on a cash basis at least daily. To reduce credit risk, all exchange participants must post a performance bond or maintain margin with the exchange. Many over-the-counter (OTC) transactions use collateral agreements. OTC transaction collateral agreements can be one- or two-sided (only one party is required to post collateral on out-of-the-money positions, or both are required to post such collateral). Netting and collateral agreements and their specific terms can materially reduce credit risk exposure. For additional explanation of the treatment of netting for capital calculations, refer to Part 325 of the FDIC Rules and Regulations.

In managing credit exposure, institutions should consider settlement and pre-settlement credit risk. The selection of dealers, investment bankers, and brokers is particularly important in effectively managing these risks. When selecting a dealer, investment banker, or broker, management should, at a minimum:

- Review each firm's most current financial statements, such as annual reports and credit reports, and evaluate its ability to honor its commitments.
- Inquire into the general reputation of the firm by contacting previous or current customers.
- Review information from State or Federal securities regulators and industry self-regulatory organizations such as NASD Regulation, Inc., concerning any formal enforcement actions against the dealer, its affiliates, or associated personnel.

Liquidity risk is the possibility that an instrument cannot be obtained, closed out, or sold at (or very close to) its economic value. As individual markets evolve, their liquidity will gradually change, but market liquidity can also fluctuate rapidly during stress periods. In some markets, liquidity can vary materially during a single day. Some markets are liquid for particular maturities or volumes, but are illiquid for others. For example, the Eurodollar futures market is liquid for contracts with maturities up to four years, but liquidity decreases for greater maturities (although maturities of up to 10 years are listed).

Many instruments trade in established secondary markets with a large number of participating counterparties. This ensures liquidity under normal market conditions. However, uniquely tailored or more thinly traded products may not have sufficient supply, demand, or willing counterparties in periods of market stress.

Operational risk is the possibility that inadequate internal controls or procedures, human error, system failure or fraud can cause losses. Operating risk can result in unanticipated open positions or risk exposures that exceed established limits.

Legal risk is the possibility that legal action will preclude a counterparty's contractual performance. Legal risk may occur when a contract or instrument violates laws or regulations. Legal risk may also occur when a law or regulation prohibits a counterparty from entering into a particular contract, or if an individual is not authorized to execute transactions on behalf of the counterparty. Banks should ensure that all agreements are enforceable and that counterparties can legally enter into specific transactions.

Settlement risk is the possibility of loss from a counterparty that does not perform after the investor has delivered funds or assets (before receiving the contractual proceeds). Settlement risk may result from time differences between foreign counterparties, delivery that is not synchronized with payment, or method of payment delays. Few transactions are settled on a real-time basis, and any delay in receiving funds or assets after delivering funds or assets will create settlement risk.

The most famous settlement risk example occurred in the foreign exchange markets. German regulators closed Bankhaus Herstatt after it had received deutschemarks on its foreign exchange trades, but before it had sent out its currency payments. Settlement risk is sometimes referred to as Herstatt risk.

Interconnection risk is the possibility of loss due to changes in interest rates, indices or other instrument values that may or may not be held by the investor. Cash flows associated with an instrument may be directly or indirectly tied to a number of other rates, indices or instrument values. These interconnections frequently involve cross-border and cross-market links and a wide range of individual financial instruments.

For example, a U.S. dollar denominated structured note may have a coupon formula linked to a currency exchange rate. Structured notes with coupon payments linked to the relationship between the Mexican peso and the U.S. dollar fell substantially in value when the peso fluctuated in the wake of the assassination of a Mexican presidential candidate.

Risk Measurement

Effective investment activity oversight requires accurate risk measurement. Without periodic assessments, management can not determine the success of its investment strategies. Further, the board can not determine if management has achieved the board's goals or complied with its policies.

Risk measurement should be tailored to the cash flow characteristics of each particular instrument type. For example, a mortgage derivative product should be given far more sophisticated analysis than a U.S. Treasury bill. Management's analysis should focus on risk, return, and compliance with risk limits.

Authorized investment instruments should be segregated into groups of like risk characteristics. There will likely be a group of relatively simple or standardized instruments, the risks of which are well known to the bank, which will require no pre-purchase analysis. All other authorized instruments will require pre-purchase analysis. It is important that these groups be well defined and that the pre-purchase analysis is tailored to capture the risks of the instruments. For example, it would not be appropriate to group dual-indexed structured notes with agency pass-throughs. The characteristics of these two types of instruments are different and each will require separate and distinct pre-purchase analysis. It would also not be appropriate to group simple agency pass-throughs with inverse floater collateralized mortgage obligations (CMOs). The inverse floaters are not only subject to similar prepayment optionality as the pass-throughs but also contain leverage and vastly different cash flow characteristics.

In addition to pre-purchase analysis, management should also periodically monitor investment portfolio risks. As with pre-purchase analysis, this periodic analysis should identify and measure the instrument's or the portfolio's risk characteristics. Management can perform this periodic analysis on an individual instrument basis or total portfolio (or bank) basis.

The market risk measurement system used to conduct pre-purchase analysis and periodic monitoring should be commensurate with the size and nature of the investment portfolio. For detailed comments regarding the types of risk measurement systems, refer to the Sensitivity to Market Risk section of this Manual. The risk measurement system should identify and measure all material risks. Management should translate its measurements into results that illustrate compliance with the board's risk limits. For example, to measure market risk the system should:

- Identify and measure the price sensitivity of embedded options (modified and Macaulay duration measures do not capture option risk).[1]
- Use interest rate shocks large enough to measure realistic potential market movements and risk (such as 100, 200, and 300 basis points).
- Include adjustments (for example, convexity) to accurately measure price changes when interest rate movements exceed 100 basis points.[2]
- Subject instruments to nonparallel interest rate shocks when those instruments are exposed to risk from changes in the yield curve's shape.

While management may measure risk and performance on an individual instrument basis, broader risk management should be considered. Management may aggregate individual instrument risk and return measurements to produce risk and return results for the entire investment portfolio. Portfolio results may then be aggregated into the bank's overall interest rate risk measurement system. Aggregation does not necessarily require complex systems. Management may simply combine individual instrument results to calculate portfolio analysis, or use portfolio results to compile whole bank analysis. Examiners should coordinate risk aggregation review with the staff completing the Sensitivity to Market Risk review.

Risk Reporting

To properly exercise its oversight responsibilities, the board must review periodic investment activity reports. The board should require management to periodically provide a complete investment activity report. Report frequency and substance should be commensurate with the portfolio's complexity and risk profile. Management's reports to the board should:

- Summarize all investment activity,
- Clearly illustrate investment portfolio risk and return,
- Evaluate management's compliance with the investment policy and all risk limits, and
- List exceptions to internal policy and regulatory requirements.

Management should receive reports that contain sufficient detail to comprehensively and frequently assess the portfolio.

Management should regularly ensure compliance with internal policies and regulatory requirements. In addition, management should periodically evaluate portfolio performance. The board should review and consider each policy exception. Management should present exceptions for approval before engaging in an unauthorized activity. Recurring exceptions should prompt close scrutiny from the board. When warranted, the board may consider changing its policies to permit an activity. The board should take strong action when management fails to seek prior approval for an unauthorized activity.

[1] Macaulay duration is the weighted average term to maturity of a security's cash flows. Modified duration is a measurement of the change in the value of an instrument in response to a change in interest rates. Refer to the Capital Markets Examination Handbook for additional information.

[2] Convexity is a measure of the way duration and price change when interest rates change. Refer to the Capital Markets Examination Handbook for additional information.

BOARD AND SENIOR MANAGEMENT OVERSIGHT

Board Oversight

Throughout this guidance, “board” references either the board or directors or a designated board committee. Board oversight is vital to effective investment risk management, and the board has very specific investment activity responsibilities. The board should adopt policies that establish guidelines for management and periodically review management’s performance. The board should:

- Approve broad goals and risk limits,
- Adopt major investment and risk management policies,
- Understand the approved investment activities,
- Ensure competent investment management,
- Periodically review management’s investment activity,
- Require management to demonstrate compliance with the board’s goals and risk limits, and
- Mandate an independent review program and review its findings.

Senior Management Oversight

Management is responsible for daily oversight of all investment activity. Management should:

- Establish policies, procedures, and risk limits to achieve the board’s goals,
- Implement operational policies that establish a strong internal control environment,
- Understand all approved investment activities and the related risks,
- Identify, measure, monitor, and control investment activity risks,
- Report investment activity and risks to the board;,
- Ensure that its staff is competent and adequately trained, and
- Adhere to securities broker/dealer selection policies.

Investment activity risk is not effectively managed if the board and management do not fulfill their responsibilities. Ineffective risk management can be an unsafe and unsound practice. While the board or management may obtain professional advice to supplement their understanding of investment activities and risks, their responsibilities can not be transferred to another party. The board and senior management should also periodically evaluate and, when warranted, modify the risk management process.

Investment Strategies

Management should employ reasonable investment strategies to achieve the board’s portfolio objectives. A strategy is a set of plans that management uses to direct daily portfolio operations. In order to develop sound strategies, management must understand the board’s goals, applicable risk limits, and related instruments and markets. Investment strategies should also be consistent with the following:

- Overall strategic goals,
- Capital position,
- Asset/liability structure,
- Earnings composition, and
- Competitive market position.

Strategies will vary widely between banks, ranging from simple to extremely complex. However, any strategy should be documented, reasonable, and supportable. Examiners will evaluate strategies to determine their effect on risk levels, earnings, capital, liquidity, asset quality, and overall safety and soundness. Additional guidance on investment strategies and market risk modification strategies is provided in this section under the headings Investment Strategies and the Market Risk Modification respectively.

Delegation of Investment Authority

Investment authority may be delegated to a third party, with specific board approval. Regardless of whether the board’s policies permit management to delegate investment authority to a third party, management must understand every investment’s risk, return, and cash flow characteristics. To conduct its independent analysis, management may rely on information and industry standard analysis tools provided by the broker/dealer, provided that:

- The analysis uses reasonable calculation methods and assumptions,
- Management understands the analysis and assumptions, and
- Management’s investment decisions remain independent.

If management does not understand an investment’s risk characteristics, then management should not engage in that activity until it possesses the necessary knowledge. Failure to adequately understand and manage investment activity risks constitutes an unsafe and unsound practice.

Before delegating investment authority to a third party, management should thoroughly evaluate the third party's reputation, performance, creditworthiness, and regulatory background. Any third party arrangement should be governed by a formal written agreement that specifies:

- Compensation,
- Approved broker/dealers,
- Investment goals,
- Approved activities and investments,
- Risk limits,
- Risk and performance measurement,
- Reporting requirements,
- Settlement practices, and
- Independent review.

In addition, written agreements should require that all trade invoices, safekeeping receipts, and investment analyses are readily available to the bank.

Program Evaluation

Periodically, the board and management should evaluate the risk management program to ensure that its investment activities reasonably meet the board's goals and the bank's strategic needs. Without such an assessment, the board and management cannot prudently oversee investment activities. The scope and detail of the evaluation should correspond to the bank's size, complexity, and investment activities. At most banks, annual evaluations should be sufficient. In larger or more complex banks, quarterly (or more frequent) evaluation may be necessary.

The board should review management's reports, including an investment activity summary, portfolio risk and performance measures, and independent review findings to identify broad weaknesses and determine if:

- Stated goals accurately represent the board's objectives,
- Risk limits properly reflect the board's risk tolerance,
- Risk limits reasonably protect the bank's safety and soundness,
- Management has appropriately pursued the board's goals,
- Internal controls remain adequate,
- Any new activities are warranted, and
- Policies provide sufficient guidance for management.

The board should first consider the bank's current and expected condition, competitive environment, and strategic plans. Then, the board should reassess its portfolio goals to ensure that they do not conflict with the overall strategic plan. When necessary, the board should adjust its portfolio goals.

After evaluating its goals, the board should then affirm that the existing risk limits accurately reflect the board's risk tolerance. When warranted, the board should consider either relaxing or tightening the risk limits placed on management. Before altering its risk limits, the board should discuss the effects of accepting increased or reduced risk. The board should consider if increased or diminished risk would produce satisfactory returns.

In addition, the board should evaluate management's performance. That review should encompass management's success at achieving the board's goals, adherence to policies and risk limits, and maintenance of an effective control environment. The board should determine the cause of any material deficiencies and obtain management's commitment to rectify those deficiencies.

Finally, the board should determine if any changes to its policies are warranted. For example, management may request authority to engage in new investment activities. The board should carefully consider such requests and determine if the proposed activity comports with its investment goals and risk tolerance.

Management should review the portfolio management program in more detail to identify both broad and specific weaknesses. Management's responsibilities include:

- Measuring portfolio risk and performance,
- Validating risk measurement systems' adequacy and accuracy,
- Reporting portfolio activity and performance to the board,
- Adjusting investment strategies to better achieve the board's goals, and
- Correcting policy and regulatory exceptions.

At many banks, the periodic evaluation will result in few program alterations. Less complex programs will naturally require fewer modifications than more complex programs. Successful programs will similarly need fewer changes than unsuccessful programs. Examiners will assess the periodic evaluations to determine if the board and management effectively oversee the portfolio management process.

COMPLIANCE

Permissible Activities

Part 362 of the FDIC's Rules and Regulations, "Activities and Investments of Insured State Banks," (Part 362) implements Section 24 of the Federal Deposit Insurance Act. Part 362 generally prohibits investment activities that are not permissible for national banks, with certain exceptions. National bank investment activities are governed by the National Bank Act (12 USC 21 et seq.) and Office of the Comptroller of the Currency (OCC) regulations (12 CFR Part 1). 12 CFR Part 1 outlines five general types of investments that are permissible for national banks. A copy of the updated rule may be found at the OCC's Internet site, http://www.occ.treas.gov/ftp/regs/part1a.txt.

In limited circumstances, the FDIC may grant an exception to Part 362, on a case-by-case basis, if the FDIC determines that:

- The activity presents no significant risk to the deposit insurance fund, and
- The bank complies with the FDIC's capital regulations.

While Part 362 contains investment type restrictions, it does not include the investment amount restrictions that apply to national banks.

REPORT OF EXAMINATION TREATMENT

Adverse Classification

Examiners may adversely classify subinvestment quality securities and off-balance sheet derivatives in the Report of Examination. Any classifications should be consistent with the Uniform Agreement on the Classification of Assets and Appraisal of Securities Held by Banks and Thrifts. This Agreement addresses the examination treatment for adversely classified assets and:

- Provides definitions of the Substandard, Doubtful, and Loss categories used for criticizing bank and thrift assets,
- Defines characteristics of investment quality and subinvestment quality securities.,
- Establishes specific guidance for the classification of subinvestment quality debt securities and other-than-temporary impairment on investment quality debt securities, and
- Provides examiners discretion in classifying debt securities beyond a ratings-based approach in certain cases.

Substandard assets are inadequately protected by the current sound worth and paying capacity of the obligor or of the collateral pledged, if any. Assets so classified must have a well-defined weakness or weaknesses that jeopardize liquidation of the debt. They are characterized by the distinct possibility that the bank will sustain some loss if the deficiencies are not corrected.

Doubtful assets have all the weaknesses found in Substandard assets, with the added characteristic that the weaknesses make collection or liquidation in full (on the basis of currently existing facts, conditions, and values) highly questionable and improbable.

Loss classifications are assigned to assets that are considered uncollectible and of such little value that their continuance as bankable assets is not warranted. This classification does not mean that the asset has absolutely no recovery or salvage value, but rather it is not practical or desirable to defer writing off this basically worthless asset even though partial recovery may be affected in the future. Amounts classified Loss should be promptly charged off.

Investment quality debt securities are marketable obligations in which the investment characteristics are not distinctly or predominantly speculative. This group generally includes investment securities in the four highest rating categories provided by nationally recognized statistical rating organizations (NRSROs) and unrated debt securities of equivalent quality. The Securities and Exchange Commission (SEC) lists the following as NRSROs:

- Dominion Bond Rating Service Ltd.,
- Fitch, Inc.,
- Moody's Investors Service, and
- Standard & Poor's Division of the McGraw Hill Companies Inc.

(Check the SEC's website to find the most current list of NRSROs).

When two or more NRSROs list different credit ratings for the same instrument, examiners will generally base their assessments on the more recently issued ratings.

Since investment quality debt securities do not exhibit weaknesses that justify an adverse classification rating, examiners generally will not classify them. However, published credit ratings occasionally lag demonstrated changes in credit quality and examiners may, in limited cases, classify a security notwithstanding an investment grade rating.

Some debt securities may have investment quality ratings by one (or more) rating agencies and sub-investment quality ratings by others. Examiners will generally classify such securities, particularly when the most recently assigned rating is not investment quality. However, an examiner has discretion to "pass" a debt security with both investment and sub-investment quality ratings. The examiner may use that discretion if, for example, the institution has demonstrated through its documented credit analysis that the security is the credit equivalent of investment grade.

Some individual debt securities have ratings for principal, but not interest. The absence of a rating for interest typically reflects uncertainty regarding the source and amount of interest the investor will receive. Because of the speculative nature of the interest component, examiners will generally classify such securities, regardless of the rating for the principal.

Non-rated debt securities have no ratings from a NRSRO and the FDIC expects institutions holding individually large non-rated debt security exposures, or having significant aggregate exposures from small individual holdings, to demonstrate that they have made prudent pre-acquisition credit decisions and have effective, risk-based standards for the ongoing assessment of credit risk. Examiners will review the institution's program for monitoring and measuring the credit risk of such holdings and, if the assessment process is considered acceptable, generally will rely upon those assessments during the examination process. If an institution has not established independent risk-based standards and a satisfactory process to assess the quality of such exposures, examiners may classify such securities, including those of a credit quality deemed to be the equivalent of subinvestment grade, as appropriate.

Some non-rated debt securities held in investment portfolios represent small exposures relative to capital, both individually and in aggregate. While institutions generally have the same supervisory requirements (as applicable to large holdings) to show that these holdings are the credit equivalent of investment grade at purchase, comprehensive credit analysis subsequent to purchase may be impractical and not cost effective. For such small individual exposures, institutions should continue to obtain and review available financial information, and assign risk ratings. Examiners may rely upon the bank's internal ratings when evaluating such holdings.

Foreign debt securities are often assigned transfer risk ratings for cross border exposures from the Interagency Country Exposure Review Committee (ICERC). However, examiners should use the guidelines in the Uniform Agreement rather than ICERC transfer risk ratings in assigning security classifications, except when the ICERC ratings result in a more severe classification.

Subinvestment quality debt securities are those in which the investment characteristics are distinctly or predominantly speculative. This group generally includes debt securities, including hybrid equity instruments (i.e. trust preferred securities), in grades below the four highest rating categories, unrated debt securities of equivalent quality, and defaulted debt securities.

Other Types of Securities such as certain equity holdings or securities with equity-like risk and return profiles, have highly speculative performance characteristics. Examiners should generally classify such holdings based upon an assessment of the applicable facts and circumstances.

Treatment of Declines in Fair Value

Under generally accepted accounting principles (GAAP), an institution must assess whether a decline in fair value below the amortized cost of a security – that is, the depreciation on the security – is a "temporary" or "other-than-temporary" impairment. When the decline in fair value on an individual security represents other-than-temporary impairment, the cost basis of the security must be written down to fair value, thereby establishing a new cost basis for the security, and the amount of the write-down must be reflected in current period earnings. This new cost basis should not be adjusted through earnings for subsequent recoveries in fair value. If an institution's process for assessing impairment is considered acceptable, examiners may use those assessments in determining the appropriate classification of declines in fair value below amortized cost on individual debt securities.

Any decline in fair value below amortized cost on defaulted debt securities will be classified as indicated in the General Debt Security Classification Guidelines Table following. Apart from classification, for impairment write-downs or charge-offs on adversely classified debt securities, the existence of a payment default will generally be considered a presumptive indicator of other-than-temporary impairment.

The following table outlines the uniform classification approach the agencies will generally use when assessing credit quality in debt securities portfolios:

General Debt Security Classification Guidelines Table			
Security Type	**Classification**		
	Substandard	***Doubtful***	***Loss***
Investment quality debt securities with "temporary" impairment	----	----	----
Investment quality debt securities with "other than temporary" impairment	----	----	Impairment
Subinvestment quality debt securities with "temporary" impairment	Amortized Cost	----	----
Subinvestment quality debt securities with "other than temporary" impairment, including defaulted debt securities.	Fair Value	----	Impairment
NOTE: Impairment is the amount by which amortized cost exceeds fair value.			

The General Debt Security Classification Guidelines do not apply to private debt and equity holdings in a small business investment company or Edge Act Corporation. The Uniform Agreement does not apply to securities held in trading accounts, provided the institution demonstrates through its trading activity a short term holding period or holds the security as a hedge for a valid customer derivative contract.

Examiner Discretion in Classifying Securities

Examiners may assign a more or less severe classification for an individual debt security than would otherwise apply based on the security's rating depending upon a review of applicable facts and circumstances. However, examiners may not assign a Loss classification to the depreciation on an individual debt security when this impairment is determined to be temporary. Examiners have discretion to "pass" a debt security with both investment and sub-investment quality ratings. For an investment quality debt, examiners have the discretion to assign a more severe classification when justified by credit information the examiner believes is not reflected in the rating, to properly reflect the security's credit risk. As mentioned above, published credit ratings occasionally lag demonstrated changes in credit quality and examiners may, in limited cases, classify a security notwithstanding an investment grade rating.

Furthermore, examiners may in limited cases "pass" a debt security that is rated below investment quality. For example, when the institution has an accurate and robust credit risk management framework and has demonstrated, based on recent, materially positive, credit information, and properly documented credit analysis, that the security is the credit equivalent of investment grade, examiners have the discretion to "pass" the security, irrespective of the rating.

When an institution has developed an accurate, robust, and documented credit risk management framework to analyze its securities holdings, examiners can depart from the General Guidelines in favor of individual asset review in determining whether to classify those holdings. A robust credit risk management framework entails appropriate pre-acquisition credit due diligence by qualified staff that grades a security's credit risk based upon an analysis of the repayment capacity of the issuer and the structure and features of the security. It also involves the continual monitoring of holdings to ensure that risk ratings are reviewed regularly and updated in a timely fashion when significant new information is received.

The credit analysis of securities should vary based on the structural complexity of the security, the type of collateral and external ratings. The credit risk management framework should reflect the size, complexity, quality, and risk characteristics of the securities portfolio, the risk appetite and policies of the institution, and the quality of its credit risk management staff, and should reflect changes to these factors over time. Policies and procedures should identify the extent of credit analysis and documentation required to satisfy sound credit risk management standards.

Subinvestment Quality Available-for-Sale (AFS) Debt Securities

Consistent with Statement of Financial Accounting Standards (FAS) 115, AFS debt securities are "marked-to-market" and carried at their fair value on the balance sheet for regulatory reporting purposes. The unrealized holding gains (losses) on these securities, net of tax effects, are excluded from earnings and reported in a separate component of equity capital on the balance sheet. However, for purposes of determining a bank's regulatory capital under Part 325 of the FDIC's regulations, any unrealized holding gains (losses) on these AFS debt securities that are included in the separate equity capital component generally are ignored. As a result, any amortized cost amount in excess of fair value on an AFS debt security – that is, the amount of impairment or depreciation – normally is not deducted in determining regulatory capital.

However, in order to appropriately reflect in regulatory capital calculations the effect of any depreciation on a subinvestment quality AFS debt security, when the depreciation on such a security is deemed to be other than temporary and is therefore classified Loss, the depreciation should be deducted in determining Tier 1 capital. In addition, consistent with FAS 115 and Emerging Issues Task Force (EITF) Issue No. 03-1, when the depreciation represents an impairment that is other than temporary, the bank should recognize an impairment loss in current period earnings equal to the difference between the security's amortized cost and its fair value. This fair value then becomes the new cost basis for the AFS debt security and the new cost basis should not be adjusted through earnings for subsequent recoveries in value. Nevertheless, this AFS debt security must continue to be "marked-to-market" with the unrealized holding gains (losses) reported directly in equity capital.

For subinvestment quality AFS debt securities with temporary impairment, amortized cost rather than the lower amount at which these securities are carried on the balance sheet, i.e., fair value, is classified Substandard. This classification is consistent with the regulatory capital treatment of AFS debt securities. As mentioned above, under GAAP, unrealized holding gains (losses) on AFS debt securities are excluded from earnings and reported in a separate component of equity capital. In contrast, these unrealized holding gains (losses) are excluded from regulatory capital. Accordingly, the amount classified Substandard on these subinvestment quality AFS debt securities, i.e., amortized cost, also excludes the balance sheet adjustment for unrealized losses.

Subinvestment Quality AFS Equity Securities Equity securities may also be adversely classified if identified weaknesses warrant such treatment. Some investment advisory services issue rankings for equity instruments, which generally indicate projected investment performance rather than credit quality. Examiners should not rely on equity rankings to adversely classify equity investments. However, any AFS equity security whose cost is in excess of its fair value – that is, an equity security that has impairment or depreciation – must be evaluated to determine whether the impairment is temporary or other than temporary. When the impairment is determined to be other than temporary, the amount of the impairment should be classified Loss. In this situation, the equity security itself may be considered subinvestment quality, in which case examiners should also adversely classify the fair value of the equity security Substandard. Consistent with the treatment of AFS debt securities, when the impairment on an AFS equity security is determined to be other than temporary, the bank should recognize an impairment loss in current period earnings equal to the difference between the security's cost and its fair value. This fair value then becomes the new cost basis for the AFS equity security and the new cost basis should not be adjusted through earnings for subsequent recoveries in value. Nevertheless, this AFS equity security must continue to be "marked-to-market" with the unrealized holding gains (losses) reported directly in equity capital.

Securities with Substantial Prepayment Risks FAS 115, as amended by FAS 140, does not permit a debt security to be designated as held-to-maturity (HTM) if it can be prepaid or otherwise settled in such a way that the security holder would not recover substantially all of its recorded investment. Thus, those debt securities with a risk of substantial investment loss in the event of early prepayment, such as interest-only stripped mortgage backed securities and principal-linked structured notes, cannot be treated as HTM securities and carried at amortized cost. Rather, these securities should be categorized as either trading or AFS securities and reported at their fair value on the balance sheet for regulatory reporting purposes. The General Debt Security Classification Guidelines shown above should be applied to these securities when they have been categorized as AFS securities.

Determining Fair Value

As currently defined under GAAP, the fair value of an asset is the amount at which that asset could be bought or sold in a current transaction between willing parties, that is, other than in a forced or liquidation sale. Quoted market prices are the best evidence of fair value and must be used as the basis for measuring fair value, if available. If quoted market prices are not available, the estimate of fair value must be based on the best information available in the circumstances. The estimate of fair value must consider prices for similar assets and the results of valuation techniques to the extent available in the circumstances.

In order to properly classify a security or determine any necessary regulatory capital adjustment, examiners must determine its fair value. Examiners will review management's fair values for all adversely classified securities. When management's valuation for an adversely classified security appears reasonable, examiners will use that value to determine classification amounts. If management's valuation does not appear reasonable, examiners will discuss concerns with management and request that management provide a more reasonable valuation during the examination. When management cannot provide a reasonable valuation during the examination, examiners should use the information services provided by the Capital Markets Branch of the Division of Supervision and Consumer Protection in Washington, D.C.

Qualitative Capital Adequacy Considerations for Securities

Although unrealized holding gains (losses) on HTM and AFS debt securities normally are not recognized in calculating a bank's regulatory capital ratios, examiners should evaluate the extent of any unrealized appreciation or depreciation on these debt securities in making an overall qualitative assessment of the bank's capital adequacy and in evaluating whether the bank has an effective risk management system for securities. Such a risk management system should include:

- Policies, procedures, and limits,
- Risk identification, measurement, and reporting, and
- Internal controls.

Examiners should discuss any concerns that result from this assessment with management.

OTHER GUIDANCE

Trading

Trading activities involve strategies or transactions designed to profit from short term price changes. Trading activities almost always employ active strategies, which assume that the bank can consistently outperform the market. Trading programs can generate significant earnings, but also create unique risk exposures. The board and management have the responsibility to identify, measure, monitor, and control trading activity risks.

Failure to adequately understand and manage trading activity risks is an unsafe and unsound practice.

This section's investment activity guidance also applies to all trading activity. In addition, trading programs should include:

- Specific board approval and periodic review,
- Separate policies and procedures,
- Management that possesses sufficient expertise,
- Segregated accounting and reporting,
- A risk measurement system that quantifies potential trading loss,
- Performance measurement relative to established benchmarks,
- Strong conflict of interest guidelines, and
- Appropriately rigorous internal controls.

The trading program's risk measurement system should identify and measure all material risks, including potential trading loss for defined periods. For example, the system could measure potential one day trading loss for a given set of statistical assumptions. Management's assumptions should be reasonable, supported, and consistent. Results should be translated into terms that clearly illustrate compliance with the board's trading risk limits.

To measure the performance of the bank's trading activity, trading desks, or individual traders, management will generally seek to compare their results to established performance standards or to benchmarks. For example, a benchmark's return represents the return for simply adopting a passive investment strategy in a similar class of investments. Performance evaluation benchmarks commonly used are market indexes. Indexes frequently used as equity portfolio benchmarks include the Standard and Poor's 500 Index and the Russell 2000 Index. An index frequently used as a bond portfolio benchmark is the Lehman Brothers Aggregate Bond Index. Management should select benchmarks that provide realistic comparative value. When the trading portfolio consistently fails to achieve returns at least equivalent to reasonable benchmarks, management should assess whether the program achieves the board's objectives.

Whenever a bank reports or demonstrates trading activity, examiners should refer to Part 325 of the FDIC's Rules and Regulations and determine if the bank adheres to all trading-related requirements.

Accounting

Accurate accounting is essential to the evaluation of a bank's risk profile and the assessment of its financial condition and capital adequacy. Reporting treatment for securities and derivative holdings should be consistent with the bank's business objectives, generally accepted accounting principles (GAAP), and regulatory reporting standards. When necessary, examiners should consult regional accounting specialists for additional guidance. A listing of pertinent accounting guidance is included in the Accounting Guidance portion of this section.

FAS 115, *Accounting for Certain Investments in Debt and Equity Securities*, must be adopted for Call Report purposes by all banks. It requires banks to divide their securities holdings among three categories: held-to-maturity (HTM), available-for-sale (AFS), and trading. Different accounting treatment applies to each category. Only debt securities which management has the positive intent and ability to hold to maturity may be designated as HTM and carried at amortized cost. AFS securities are those that management has not designated for trading or as HTM. AFS securities are reported at fair value, with unrealized gains and losses excluded from earnings and reported in a separate capital component. Securities held for trading must be reported at fair value, with unrealized gains and losses recognized in current earnings and regulatory capital. Proper categorization ensures that trading gains and losses are promptly recognized in earnings and regulatory capital. Refer to the Call Report Instructions for additional information.

Reporting trading assets as HTM or AFS is an unsafe and unsound practice. The substance of management's securities activities determines whether securities reported as HTM or AFS are, in fact, held for trading. While there are no standard benchmarks for identifying trading activity, trading generally reflects active and frequent buying and selling of securities for the purpose of generating profits on short-term fluctuations in price.

Examiners should also evaluate the extent of any unrealized gains and losses on both AFS and HTM securities when evaluating capital adequacy.

FAS 144, *Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities*, and its predecessor amended FAS 115 and clarified that a debt security may not be classified HTM if it can contractually be prepaid or otherwise settled in such a way that the bank would not recover substantially all of its recorded investment. This provision is effective for financial assets held on or acquired after January 1, 1997 (no grandfather provision).

Premiums and discounts should be accounted for according to the Call Report Instructions. Inadequately amortized premium amounts should be adversely classified as Loss.

Trade date accounting is preferred (to settlement date accounting) for Call Report purposes to report HTM, AFS, and trading assets (other than derivatives). However, if the reported amounts under settlement date accounting would not be materially different from those under trade date accounting, settlement date accounting is acceptable.

Derivatives regulatory reporting instructions require that derivatives be reported in accordance with GAAP, and in particular FAS 133, *Accounting for Derivative Instruments and Hedging Activities*; FAS 138, *Accounting for Certain Derivative Instruments and Certain Hedging Activities-an amendment of FAS 133,* and FAS 149, *Amendment of Statement 133 on Derivative Instruments and Hedging Activities.* In addition, the reporting should conform to the interpretive reporting guidance provided in the regulatory reporting instructions. These instructions state that derivatives generally should be marked to market, with resulting market value gains and losses recognized in current earnings. However, if certain criteria are met, banks may defer the recognition in income of gains and losses on derivative instruments used for hedging until they recognize in income the effects of related changes on the items hedged.

Market risk modification (including hedging) transactions accounting should be consistent with the board's risk management and accounting policies. Consistent with GAAP, derivatives and the hedged assets and liabilities must be designated when the hedging transaction is initiated. Management should retain adequate documentation to support deferrals of gains and losses, including the market risk modifications strategy and performance criteria.

Examiners having questions regarding the accounting for derivatives should consult with their regional accounting specialist.

Information Services

The Capital Markets Branch can help examiners identify a security's characteristics and risks. Capital Markets can provide a variety of security and derivative data to examiners, including prices, credit ratings, historical interest rates, mortgage prepayment forecasts, derivatives market summaries, and other information.

Prices and ratings should be requested through the Capital Markets Branch's Security Information Request System (SIRS). To use SIRS, examiners complete a computer data entry form and transmit it via electronic mail to a dedicated address. The Capital Markets Branch will enter all available data in the form and transmit it to the examiner within five business days of receipt. The data entry form is an automated Excel file that may be downloaded from the Capital Markets Branch's FDIC website.

Examiners should first submit a sample of a bank's securities and derivatives. When sampling results in material, unresolvable discrepancies, examiners may expand the sample and seek management's commitment to address any deficiencies. Prices provided by the Capital Markets Branch should not be substituted for management's prices, unless significant deficiencies are not resolved. Examiners should only submit requests to price an entire portfolio when a material safety and soundness concern exists.

The Capital Markets Branch obtains price and rating information from several sources. Prices are indications of value, but do not necessarily represent potential purchase or sale values. Whenever available, prices are drawn from market observations. However, many instruments do not trade on organized exchanges. In such circumstances, the Capital Markets Branch's sources provide estimated prices that have been derived from valuation models. These estimated prices are indications of value, not precise purchase or sale prices. Credit ratings are obtained from several of the NRSROs.

Historical interest rates are provided in the Market Index and Rate Application (MIRA). MIRA contains a ten-year database of rates, current forward rates, summary reports, yield curves, and an index comparison analysis feature. MIRA is an automated Excel template which examiners may download from the Capital Markets Branch's FDICnet site.

Mortgage prepayment forecasts and derivative market summaries are provided in a simple spreadsheet format and may be downloaded from the Capital Markets Branch's FDICnet site.

Other information, including detailed analytics and financial information for debt and equity issuers, may be requested on an individual basis. In addition, examiners may contact the Capital Markets Branch for guidance on examination procedures, supervisory policy, and Report of Examination treatment. Examiners should coordinate those requests with a Senior Capital Markets and Securities Specialist in their assigned regional office before contacting the Capital Markets Branch.

Settlement Practices, Confirmation and Delivery Requirements, and Delivery Documentation

Settlement Practices

Inadequate understanding of standard settlement practices coupled with poor internal controls can result in unnecessary costs or losses.

U.S. Treasury and Agency securities normally settle the next full business day after the trade date. Transactions involving U. S. Treasury and Agency obligations are typically in book-entry form, rather than in physical certificate form. Book-entry is an electronic registration, transfer, and settlement system that enables the rapid and accurate registration and transfer of securities with concurrent cash settlement. Book-entry reduces handling costs and quickens transaction completion. U. S. Treasury and Agency book-entry securities are delivered and cleared over the Federal Reserve Wire System (Fedwire) on a delivery versus payment basis. Acceptance of the security automatically debits the payment amount from the buyer's account and credits it to the seller's account. The payment and securities involved are transferred over the Fedwire system. The Federal Reserve Bank of New York maintains the book-entry custody system. All depository banks are eligible to maintain book-entry accounts at their local Reserve bank, provided that they also maintain a funds account with their Reserve bank.

Corporate and municipal bonds normally settle three full business days after the date of the transaction. The Municipal Securities Rulemaking Board Rule G-15 established guidelines for the settlement of municipal securities transactions. Corporate and municipal debt securities are available in book-entry and registered, definitive form. Book-entry corporate and municipal bonds settle through the Depository Trust Company (DTC). Members effect securities deliveries through DTC via computerized bookkeeping entries.

Mortgage securities settlement procedures are more complex than those for government, corporate, and municipal bonds. The Bond Market Association developed the "Uniform Practices for the Clearance and Settlement of Mortgage-Backed Securities and Other Related Securities" (Uniform Practices) to establish industry standards for mortgage securities settlements. Since the Uniform Practices are updated frequently, banks engaged in mortgage and asset-backed securities transactions should keep abreast of current settlement standards. The current Uniform Practices are summarized in the following paragraphs.

Government National Mortgage Association (GNMA) guaranteed mortgage pass-through securities are available in book-entry and definitive form. While most GNMA securities have been converted to book-entry, some physical certificates still exist. Book-entry GNMA securities settle through the Participants Trust Company (PTC) MBS Depository.

The Federal National Mortgage Association (FNMA) and Federal Home Loan Mortgage Corporation (FHLMC) both issue Real Estate Mortgage Investment Conduits (REMICs) and mortgage pass-through securities. Since 1985, these securities have been issued in book-entry form only. Nearly all of the agency's securities that were issued in definitive, registered form before 1985 have been converted to book-entry. Book-entries are transferred, delivered, and settled through the Fedwire system.

Private label CMOs/REMICs (those issued by an entity other than FNMA and FHLMC) and asset backed securities (ABSs) are available in book-entry and registered, definitive form. Book-entry private label CMOs/REMICs and ABSs settle through the DTC. Private label pass-through securities are only available in physical form.

Confirmation and Delivery Requirements

Within one business day following the trade date, each party in a CMO/REMIC, stripped mortgage-backed security (SMBS), or ABS transaction should send a written confirmation of the transaction to the other party. Banks should have procedures established to issue, receive, and verify confirmations in a timely fashion. A bank is bound to a particular trade if it does not object to the written confirmation within 10 days of its receipt. Failure to exercise appropriate controls over confirmation procedures may result in the receipt or delivery of incorrect securities and improper payment amounts. The confirmation must contain the following information:

- Price,
- Trade date,
- Coupon rate,
- Maturity date,
- Settlement date,
- CUSIP number,
- Settlement amount,
- Original face amount,
- Security description,
- Confirming party's name and address, and
- Designation of "purchase from" and “sale to."

Confirmation procedures for mortgage pass-through securities differ from those for CMOs/REMICs, SMBSs, and ABSs, due to the manner in which mortgage pass-through securities typically trade. Most trades of mortgage pools occur on a To Be Announced (TBA) basis. In TBA transactions, information on the mortgage pools, such as pool numbers, is not known at trade time. Instead, the seller notifies the buyer of the pool numbers and original face values of the underlying securities at least 48 hours before delivery. No later than the second business day before the settlement date of each TBA transaction, the seller must transmit the following information to the buyer:

- Price
- Coupon rate and product
- Trade date and settlement date
- Pool, group, or other identification number
- Issue date and maturity date for new pools
- Identification of firm sending the information
- Original face amount for each pool or group number within the transaction

This information may be transmitted to the buyer verbally or by fax. If agreed to by both parties, the information may also be sent electronically. If the seller does not transmit the required information before the 48-hour deadline, the seller can not make delivery earlier than two business days after such information is transmitted. The seller must then promptly confirm in writing the following information:

- Price,
- Settlement date,
- Current face amount,
- Proceeds to be paid,
- Amount of accrued interest,
- Identification of the "contra party,"
- Designation of "purchase from" or "sale to,"
- Pool, group, or other identification number,
- Original face value for each pool or group number,
- Confirming party's name, address, and telephone number,
- Securities' description, settlement month, coupon rate, and product type, and
- Additional information as agreed to by the parties of the transaction.

The delivery variance permitted on TBA trades is plus or minus 2.50 percent of the dollar amount of the transaction agreed to by the parties. There is no variance permitted on transactions in which the seller provides the buyer with a specific pool number and a specific original face amount at the time of the trade. The 2.50 percent variance is applicable to each $1,000,000 within a TBA trade larger than $1,000,000. There are a maximum number of pools that may be delivered to satisfy a TBA trade. For securities with coupon rates below 12 percent, no more than three pools per $1,000,000 may be delivered. Up to four pools per $1,000,000 may be delivered for securities with coupons of 12 percent and above. TBA transactions that do not conform to these guidelines may result in "failed" trades.

The settlement amount (sum of the principal amount and accrued interest) is the amount payable by the buyer to the seller on the settlement date. Refer to the Capital Markets Examination Handbook for settlement amount formulas.

Delivery Documentation

Banks that purchase and sell mortgage-backed and other related securities in physical form must be aware of the documentation requirements contained in the Uniform Practices. Physical securities must have assignments for their registration in the name of the buyer on the books of the issuer or transfer agent. Each certificate must be accompanied by an assignment on the certificate or separate assignment for each certificate containing a signature that corresponds to the name written on the certificate. A detached assignment (standard corporate bond power) must provide for the irrevocable appointment of an attorney with power of substitution and must include a full description of the security, maturity date, series number, interest rate, and par amount. Each assignment, endorsement, alteration, and erasure must bear a guarantee acceptable to the issuer or transfer agent. A certificate registered in the name of a party other than a natural person will constitute good delivery only if it is accompanied by evidence of the authority of the assignor to transfer the securities.

If a trade has a settlement date between a record date and a payable date, delivery of the securities must be accompanied by a due bill. A due bill is a document delivered by a seller of a security to a buyer evidencing that any principal and interest received by the seller past the record date will be paid to the buyer by the seller upon submission of the due bill for redemption. The record date is the date set by the trustee for determining who will be paid principal and interest on a security. Book-entry messages are considered acceptable due bill substitutes for securities transferred over Fedwire, DTC, or PTC. Due bills and book-entry messages cease to be valid after 60 days from their issue date. A bank may experience considerable delays in attempting to recover payments without the use of a due bill, which can result in the accumulation of significant principal and interest receivable accounts. If delivery and payment on a trade occur after a record date and on or after a payable date, delivery of the securities must be accompanied by a check for the principal and interest due.

Examiners may review the bank's procedures for good delivery verification and interview bank personnel. The bank's policies for mortgage-backed and other related securities should conform to the Uniform Practices, and the operations staff should be thoroughly familiar with these standards. Failed trade frequency and costs will provide a general quality indicator for the overall settlement practices.

When a bank is on the sell side of a TBA trade, pools must be delivered to the buyer within good delivery guidelines. The process of assigning pools to a TBA transaction is known as allocation. While allocation is a critical part of the settlement process, relatively little effort is normally expended on this function by traders and senior management. Instead, the operations staff is usually responsible for performing allocations. The independent review should periodically confirm that the allocations meet good delivery guidelines. Prudent allocation controls will reduce the likelihood of costly "fails."

The operations department should also be aware of the Uniform Practices for reclamations. A reclamation is a claim for the right to return or the right to demand the return of a security that has been previously accepted as a result of bad delivery or other irregularities in the settlement process. Either party may make a reclamation if information is discovered after delivery, which if known at the time of delivery, would have caused the delivery not to constitute good delivery. Reclamation must be made within the stated time limits established by the Bond Market Association.

INVESTMENT STRATEGIES

Passive strategies generally do not require forecasting or complex analysis. Rather, management seeks to mirror a particular market segment’s performance or to retire predetermined liabilities. Adopting a passive investment strategy is a management decision to not attempt to outperform the market. Passive strategies typically incur lower expenses than do active strategies.

<u>Indexing</u> involves assembling a portfolio that closely resembles the risk and return characteristics of a preferred market index. For fixed-income portfolios, the portfolio may possess the same maturity, duration, credit quality characteristics, coupon, industrial classification, call or sinking fund features as the index. Advantages of passive bond portfolio management using indexing include low management and advisory fees, performance that mirrors the market, and low costs due to minimal turnover and no research. Disadvantages include performance that is no better than average, no immunization against interest rate risk, no guarantee that a specific liability stream can be funded from the portfolio, and the exclusion of many different types of bonds in the market. For example, zero-coupon U. S. Treasuries and most asset-backed securities are generally excluded from most conventional broad bond market indexes.

<u>Immunization</u> is a strategy that is employed to provide protection against the interest rate risk of a liability stream. The strategy requires that a bond portfolio be structured so that its interest rate risk characteristics (Macaulay duration) match those of the liability stream. The strategy, which is often referred to as "duration matching," requires advanced calculations and frequent re-balancing.

Active strategies involve detailed analysis, such as forecasting future events or interest rates, and selecting investments that will perform best under those conditions. Active strategies typically incur greater expenses than passive strategies, due to their higher transaction volume and complex analysis.

An interest-rate expectations strategy is an attempt to maximize return based on a forecast of future interest rate movements. An example of this strategy consists of adjusting the duration of a bond portfolio to take advantage of expected changes in interest rates. The success of this strategy depends on the accurate forecasting of future interest rates.

An individual security selection strategy is an attempt to identify individual instruments that will outperform other similarly rated instruments. The most common of this type of strategy identifies an issue as undervalued because its yield is higher that that of comparably rated issues or its yield is expected to decline because credit analysis indicates the issue's rating will change. The success of this strategy depends on superior skill in performing credit analysis. An active strategy assumes that the investor will attempt to outperform the market.

Many other investment strategies may be employed without measuring risk on a portfolio basis. Two commonly used active strategies include yield curve strategies and yield spread strategies.

Yield curve strategies involve the positioning of fixed-income portfolios to capitalize on or protect against expected changes in the shape of the Treasury yield curve. These strategies may be referred to as "riding the yield curve." Three common yield curve strategies are bullet strategies, ladder strategies, and barbell strategies.

A *bullet* portfolio is constructed so that the maturity of the securities is highly concentrated at one point on the yield curve. A *laddered* portfolio spreads instruments (and reinvestment risk) across the maturity spectrum and provides regular cash flows. A typical laddered portfolio is constructed with approximately equal percentages of the portfolio maturing at different segments of the yield curve. A *barbell* portfolio concentrates instruments at the short term and long term extremes of the maturity spectrum. Barbell strategies can be used to take advantage of, or compensate for, non-parallel shifts in the yield curve. These strategies are based on the theory that the value of long-term bonds will appreciate more when long-term market interest rates fall, than shorter-term bonds depreciate even if short-term market interest rates simultaneously rise (a non-parallel yield curve shift). The ability to reinvest the proceeds from maturing short-term bonds at higher short-term rates provides this value. The actual performance of a barbell strategy will depend upon both the type of non-parallel shift (e.g. steepening or flattening) and the magnitude of the shift. For example, barbell strategies will be disadvantageous if long-term market interest rates rise while short-term rates remain unchanged.

Yield spread[3] strategies involve the positioning of fixed-income portfolios to profit on expected changes in yield spreads between sectors of the bond market. These sectors can vary by type of issuer (such as Treasury, agencies, corporates, and mortgage-backed securities), quality or credit (such as Treasuries, triple A, double A), coupon (such as high-coupon/premium bonds, low coupon/discount bonds), and maturity (such as short, intermediate, or long term). Spreads can change for a variety of reasons. For example, the spread between top quality and lower quality bonds tends to narrow as business conditions improve, and widen when business conditions deteriorate. Making changes in the portfolio to take advantage of changes in spreads will often result in accepting additional credit risk or extension risk.

Cash flow matching strategies attempt to match the cash flow requirements of a bank's liabilities with the cash flows provided by specific investments. This approach is also known as dedicating a portfolio. Bonds are selected with maturities, principal amounts and coupon payments that match the bank's liability payment stream. Theoretically, this cash flow matching process can be continued until all liabilities have been matched by the cash flows from securities in the portfolio. Interest rate risk reduction is the primary advantage of this strategy, since a known amount of cash sufficient to fund the required payment schedule will be generated with certainty. The inability to reposition the securities being used to match liabilities, the possibility of bonds being called, and the possibility of bonds going into default are the primary disadvantages of this strategy. Cash flow matching strategies are becoming more popular in banks that use FHLB borrowings.

Using *total return* measurement in determining an investment strategy better incorporates the investor's interest rate expectations over time than either a simple yield to maturity or yield to call investment selection. The total return for an individual bond consists of the change in the market value over the measurement period; the coupon received; and the reinvestment interest on the cash flows received during the measurement period. For bond portfolios, the total return is the weighted average of the

[3] Yield spread is the yield premium of one bond over another. Traditional analysis of the yield premium for a non-U.S. Treasury bond involves calculating the difference between the yield-to-maturity of the bond in question and the yield-to-maturity of a U.S. Treasury security with a comparable maturity.

returns of the bonds in the portfolio. Selecting investments based solely on their yield to maturity assumes holding those bonds to maturity and ignores the reinvestment return on interim coupon payments.

Modern portfolio theory (MPT) refers to a variety of portfolio construction, asset valuation, and risk measurement concepts and models that rely on the application of statistical and quantitative techniques. MPT is an approach used for managing investment risk. The theory states that by creating an efficient portfolio, an investor can increase portfolio return without a commensurate risk increase, or reduce portfolio risk without a commensurate return reduction.

First, an investor should determine the required portfolio risk and return levels. By diversifying risk through prudent investment choices, an investor can reduce portfolio risk. Risk averse investors (such as most banks) require a greater expected return in exchange for assuming increased risk. Diversifying the portfolio among different asset classes, maturities, and other characteristics can provide a greater expected return without a commensurate risk increase.

The investor adds or removes assets from the portfolio in order to maintain or alter overall portfolio risk and return characteristics. The investor focuses on the entire portfolio's cash flow characteristics, risk, and return. An individual instrument may be extremely risky if evaluated independently. However, its cash flow characteristics may improve the overall portfolio's risk and return performance.

For example, an interest-only strip may be very price sensitive (market risk) under declining rate scenarios. However, that instrument may offset some or all of a portfolio's price sensitivity under rising interest rate scenarios. Each instrument's individual cash flow characteristics are analyzed to determine the instrument's incremental effect on the overall portfolio's cash flow characteristics.

This approach also demands periodic performance measurement. The investor must accurately measure both risk and return for the overall portfolio and for major portfolio segments. That is, the investor must determine if the portfolio earned a return that adequately compensated the investor for the risk level assumed. Such measurements require accurate pricing information, detailed accounting systems, and a sophisticated risk measurement system.

No particular investment strategy is superior to any other. Management must determine reasonable strategies that effectively achieve the board's goals. Refer to the Capital Markets Handbook for additional information.

MARKET RISK MODIFICATION STRATEGIES

Market risk modification strategies involve using financial instruments whose cash flow fluctuations partially or completely offset the cash flow variability of an asset, liability, or balance sheet segment. Any financial instrument with the desired cash flow characteristics may be used to modify market risk, including off-balance sheet derivatives, mortgage-backed securities, and structured notes. For many banks, market risk modification is an integral part of asset/liability management. This section provides summary guidance for market risk modification strategies. Refer to the Capital Markets Examination Handbook for more detailed information.

Bank earnings result primarily from the spread between earning asset yields and funding costs. Market interest rate changes can narrow the net interest margin and can reduce the economic value of equity. In response, management may attempt to modify the bank's market risk profile to reduce risk or improve performance.

Risk Management Process

Management must evaluate many factors before implementing a market risk modification strategy, including:

- Market risk exposure,
- The board's risk tolerance,
- Current and expected interest rate volatility,
- Cash flow forecasts,
- Strategy time horizon,
- Specific instruments and cost, and
- Potential effectiveness.

To devise a successful strategy (or simply determine if a strategy is needed), management must first quantify the bank's market risk and identify the positions whose market risk should be modified. Then, management must devise a strategy to modify those positions' market risk.

This process requires thorough understanding of the bank's market risk and cash flow characteristics for all on and off-balance sheet positions. For most banks, market risk results primarily from repricing imbalances between earning assets and funding. When developing strategy, therefore, management should typically evaluate the repricing and cash flow characteristics for all on and off-balance sheet positions. If management uses a market risk modification strategy without assessing its effects on overall bank market risk, then management may actually worsen the bank's market risk profile. Failure to understand and adequately manage those risks is an unsafe and unsound practice.

Next, management must determine the strategy's intended time horizon (the length of time the strategy must remain in place) and number of periods needed. Horizon length is an important factor, since many long-term derivatives and some securities have limited liquidity. The number of periods can be an equally important factor. For example, a strategy that involves the value of a single cash position to be liquidated or acquired on a single future date may be described as a single-period strategy. However, a multi-period strategy involves liquidation or acquisition of a cash position over successive periods. Offsetting such positions can involve a sequence of instruments that mature in corresponding periods.

Prior to implementing any market risk modification strategy, management should evaluate all related costs, including transaction costs, analysis and monitoring expense, and foregone interest income on funds paid to mark positions to market (for example, margin maintenance).

Once a strategy has been implemented, management must regularly monitor the strategy's effectiveness. However, careful development and monitoring can not guarantee a strategy will achieve the intended market risk objectives. Management should periodically evaluate instrument performance to determine if the strategy remains appropriate and effective. When warranted, management should adjust the strategy.

The examination of this area should focus on evaluating management's understanding and reporting of the instruments used in any risk modification strategies. This understanding will be reflected in a program for reviewing and documenting financial contracts and counterparty information. Determining the effectiveness of risk modification strategies should be conducted as part of the rate sensitivity module. The interest rate risk review should be able to rely on the individual investment findings of the securities and derivatives review.

Board and Management Oversight

The board and management must understand and regularly evaluate the risks and benefits from all market risk modification strategies used. Market risk modification strategies can involve complex transactions and instruments, which may include significant risk. In addition, market risk modification strategies may require enhanced management expertise and internal controls.

The board maintains oversight responsibility for all market risk modification strategies. In that role, the board should adopt policies that establish management's responsibility for developing, implementing, and monitoring the process. Those policies should specify:

- Risk limits,
- Specific exposures needing modification,
- Accounting treatment,
- Reporting,
- Monitoring,
- Permissible strategies and instruments,
- Counterparty credit risk guidelines,
- Activity limits, and
- Analysis and documentation standards.

Definition of the Term "Substantially the Same" for Holders of Debt Instruments, as Used in Certain Audit Guides and a Statement of Position

OVERVIEW

Financial institutions maintain cash on hand and at correspondent banks to comply with statutory reserve requirements and to meet customer demands. Cash accounts include U.S. and foreign coin and currency on hand and transit, clearing, and cash items. Demand and time deposits maintained at correspondent banks are often known as due from accounts, or correspondent balances. Banks maintain correspondent accounts to facilitate the transfer of funds.

Cash

Every bank must maintain a certain amount of U.S. and/or foreign coin and currency on hand. To avoid having excess nonearning assets and to minimize exposure to misappropriation and robbery, each bank should establish a policy to maintain cash balances at the minimum levels necessary to meet reserve requirements and customer demands. Federal Reserve Regulation D governs the level of required reserves. Part 326 of the FDIC Rules and Regulations requires banks to adopt appropriate security procedures to discourage robberies and to assist in apprehending persons who commit such acts.

Clearings

The term clearing is used to describe the activities involved with processing financial transactions from the time a transaction is made until it is settled. Clearing items include checks, drafts, notes, and other items that represent instructions for processing financial transactions. Financial institutions accept, collect, and process a variety of payment instruments and can participate in a variety of clearing and settlement systems.

For decades, many communities with two or more banks organized local clearinghouse associations which adopted rules governing the exchange of checks. Clearings were also processed through regional associations, correspondent banks, or the Federal Reserve. Physical items such as checks (typically submitted in batches) were often processed on proof and sorting machines that facilitated an institution's ability to verify the accuracy of individual documents, separate items by pre-identified categories, provide balance verifications for transaction types (proof), and send cash items drawn on other banks for collection (transit). Proof machines had paper handling mechanisms that fed checks, deposit slips, and other items into the system. As each item went into the system, a proof operator read and entered the courtesy amount of the check (the face value of the check). The proof machine then printed the face value on the bottom of the item in Magnetic Ink Character Recognition (MICR) ink so the transaction information could be processed electronically. Most proof machines also had a MICR reader that allowed them to read the bank and item number from pre-encoded MICR information.

Legislative changes and advances in technology now allow banks to process clearing items, or have items processed by a servicer, on equipment that captures images of items, reads the information, including MICR data, and stores images and data in a computerized file. The file can then be transmitted electronically for settlement. Similarly, institutions are now able to use remote deposit capture systems. With remote deposit capture, instead of physically transporting checks to a banking facility, customers are able to scan checks on devices maintained in their own offices and transmit information electronically to a financial institution or its service provider.

Although institutions can process clearing items such as checks quickly and efficiently using modern technologies, in many situations, checks are no longer the most convenient payment instruments for consumers. Often consumers use checks merely for person-to-person transactions that are not conducive to electronic payments. Many consumers have shifted to using fully electronic payments through Automated Teller Machine, Point-of-Sale, and on-line bill payment systems.

No matter how transactions are initiated or processed, a bank's objective remains the same: to forward items for collection quickly so funds are available as soon as possible; to distribute checks and deposits efficiently to their destinations; to establish that deposit totals balance with the totals shown on deposit tickets; to prove subsidiary and general ledger entries and other transactions; to collect data for computing customer's service charges and available funds; and to accomplish the functions accurately, securely, and efficiently.

Cash Items

Cash items are checks or other items in process of collection payable in cash upon presentation. A separate control account of all such items is generally maintained on the bank's general ledger and supported by a subsidiary record of individual amounts and other pertinent data. Cash items and related records usually are in the custody of one employee at each banking office who is designated as the collection, or exchange, teller.

In normal daily operations, all banks have items which are charged to demand deposits but which cannot be charged to individual accounts because of insufficient funds, a lack of information, unknown accounts, etc. Such items include return items, rejects, or unposted debits and may consist of checks, loan payments, or other debit memos. In some banks, such items are separated and an entry is made reclassifying them to a separate asset account. Other banks include the items in a subsidiary control account in the individual demand deposit ledgers. In that case, the account would have a debit balance that would be credited when the bank returns the checks to their sources.

Cash items not in process of collection should be carried in a noncash account and reported as other assets. These include items payable upon presentation that a bank has elected to accumulate until forwarding to payers on a periodic basis. Items not immediately payable in cash upon presentation, or items that were not paid when presented and require further collection efforts should also be included in an appropriate account, such as suspense, and shown under other assets. Many banks establish a three-day limit, after which all items not collected must be automatically transferred from cash items to a suspense account. Refer to the Other Assets section of this Manual for additional comments on cash items not in process of collection.

Due From Banks

As noted above, due from accounts enable the transfer of funds between banks. The accounts are used to facilitate the collection of cash items and cash letters, the transfer and settlement of security transactions, the transfer of participation-loan funds, the purchase or sale of Federal funds, and for many other purposes.

Due from accounts may also exist when a bank utilizes the services of another bank and maintains a minimum or compensating balance in full or partial payment for the services received. Such services may involve processing cash letters, packaging loan agreements, performing information technology or payroll services, collecting out-of-area items, or exchanging foreign currency.

Balances due from institutions cover all interest-bearing and noninterest-bearing balances whether in the form of demand, savings, or time balances, but excludes certificates of deposit held for trading.

Reciprocal balances arise when two depository institutions maintain deposit accounts with each other, i.e., when a reporting bank has both a due from and a due to balance with another depository institution. Reciprocal balances between the reporting bank and other depository institutions may be reported on a net basis when a right of set off exists. Net due from balances should be reported as deposit assets. Net due to balances should be reported as deposit liabilities.

DEPOSIT NOTES

Some banks have purchased deposit notes as investments. These instruments are a form of deposit liability somewhat similar to negotiable time certificates of deposit (CD). "Deposit notes" have been structured like corporate bonds by having a five-day corporate settlement period for purchases and semiannual interest payments calculated on a 30/360-day basis. Although maturities vary from nine months to 15 years, most "deposit notes mature in four to seven years. While the foregoing contract terms could be incorporated into a CD, certain banks, for marketing purposes, prefer to use the "deposit note" format.

Bank purchases of such notes should be made in accordance with established investment and asset/liability management policies. While these note issues tend to be rated, banks considering the purchase of a deposit note should nonetheless obtain the offering circular or other similar information to ensure that they understand the nature of such notes (including possible deposit insurance coverage) before investing. A bank's investment in a deposit note should generally be included on the balance sheet in the interest-bearing balances due from depository institutions asset category. However, if the offering circular or note instrument for a particular deposit note is available for review and it does not contain a statement to the effect that the liability represented by the note is a deposit liability of the issuing bank, the bank's investment in the note should be treated as a security or a loan based on the characteristics of the note.

Structured CDs

Structured CDs are similar to structured note investment securities in that they have customized features typically containing embedded options or having cash flows linked to various indices.

The uncertainty of the cash flows, caused by movements in interest rates or other indices, may expose banks that invest in the CDs to heightened market risk, liquidity risk, or other such risks traditionally experienced in the context of investment securities. As a result, investments in structured CDs warrant heightened supervisory attention to ensure that management understands, and has the ability to adequately monitor and manage these risks.

The risk profile of structured CDs can be very similar to that of structured notes. Certificates may include step-up features with call options, inverse floating or dual indices, or other such terms. These types of terms, in addition to severe early withdrawal penalties and the lack of an established secondary market, may result in cash flow behavior similar to that of structured notes. Proper controls for these investments include effective senior management supervision, board oversight, periodic reporting, and appropriate policies and procedures. The degree and complexity of an institution's monitoring and reporting systems should be commensurate with the volume and complexity of their investment in structured certificates.

Classification of structured CDs should be consistent with the adverse classification guidelines outline in the Securities and Derivatives section of this Manual.

EXAMINATION OBJECTIVES

When reviewing activities related to cash and due from bank accounts, examiners should consider the issues discussed below.

Primary Reserves

Cash and balances due from other banks generally represent an institution's primary liquidity reserves, except to the extent they include required reserves. Excessive cash or due from balances can have an adverse impact on earnings because they generate little or no income, while insufficient balances can contribute to a weak overall liquidity position. Examiners should review the level of primary reserves as part of the Earnings and Liquidity reviews. Some assistance in making this assessment may be obtained by referring to the UBPR. If a bank's level of cash and due from bank accounts appears considerably out of line with those of the peer group (after considering reserve requirements), or if the level changed significantly from the previous examination, or over a period of time, further investigation may be warranted.

Interbank Liabilities

All insured institutions are required to establish and maintain written policies and procedures to prevent excessive exposure to any individual correspondent, in accordance with Federal Reserve Regulation F (12 CFR Part 206), Limitations on Interbank Liabilities. This rule covers all exposure to a correspondent, including credit and liquidity risks and operational risks related to intraday and interday transactions. The regulation requires banks to establish prudent standards that consider credit, liquidity, and operational risks when selecting correspondents and terminating relationships. Where exposure is considered significant, banks must periodically review their correspondents' financial condition.

Policy standards should include exposure limits when a correspondent's financial condition, or the general level of exposure to a correspondent, creates a significant risk to a bank. Exposure limits may be fixed by amount or flexible, but should be based on the financial condition of the correspondent and the type and level of identified exposure. Regulation F provides that when exposure limits are required, banks should limit interday credit exposure to a correspondent to 25 percent of a bank's capital, unless the bank can demonstrate that its correspondent is at least adequately capitalized. When a correspondent is not at least adequately capitalized, banks should reduce their credit exposure to the 25 percent level within 120 days after the date when the current Call Report or other relevant report would be available.

Compensating Balances

Banks may be exposed to insider abuse if their officers, directors, or principal shareholders have loans at correspondent banks. For example, a correspondent bank may provide a bank insider a below-market rate loan if that officer establishes a below-market rate deposit account at the correspondent bank (in the name of their bank). In this situation the officer would be abusing their position by receiving personal gain (the below-market rate loan), and harming the bank by establishing an account at the correspondent that receives below-market returns. Therefore examiners should be alert to potential abusive relationship between executive officers, directors, and principal shareholders of a bank and that bank's correspondent banks.

Such arrangements may constitute a breach of a bank official's fiduciary obligations to the depositing bank and thus to its depositors, creditors and shareholders. In some cases, the arrangements may also involve a criminal offense.

Accordingly, if the bank maintains a correspondent account with another bank which has extended credit to any of the above persons or anyone associated with them and where there is evidence that the depositing bank may have suffered a detriment because of the loan/deposit arrangement, the situation should be thoroughly investigated. This is also the case when the bank holds a deposit from another bank and has outstanding extensions of credit to such persons in the other bank or their associates. Refer to the Bank Fraud and Insider Abuse section for further information.

Correspondent Concentration Risks

The FFIEC issued guidance (FIL-18-2010) detailing the expectation that financial institutions take actions beyond the minimum requirements established in Regulation F. The guidance clarifies that risk management practices relating to correspondent concentrations should encompasses all credit and funding exposures. In addition, management should be aware of its affiliates' exposures to individual correspondents and their affiliated entities.

A financial institution’s relationship with a correspondent can result in credit (asset) and funding (liability) concentrations. Asset concentrations may be present when an institution maintains significant due from balances; or advances, or commits to advancing, significant funds to a correspondent or their related entities. Liability concentrations may exist when an institution maintains significant due to balances; or depends on a correspondent or their related entities for a disproportionate share of its total funding.

Some correspondent concentrations may involve legitimate business purposes, such as concentrations arising when an institution maintains large due from accounts to facilitate clearing activities. However, correspondent concentrations represent diversification risks that management should consider when formulating strategic plans and risk limits. Examiners should ensure management performs appropriate due diligence procedures and adequately identifies, monitors, and manages all credit and funding concentrations.

Due Diligence

Financial institutions that maintain, or contemplate entering into, credit or funding arrangements with other financial institutions should establish correspondent risk management programs. The programs should include written investment, lending, and funding policies that incorporate appropriate risk limits. In addition, the programs should ensure institutions conduct analysis of credit transactions prior to committing to, or engaging in, the transactions. The terms of all credit and funding transactions should avoid conflicts of interest and conform to sound investment, lending, and funding practices.

Identifying Credit Concentrations

Credit concentrations involve a variety of assets and activities. For example, an institution could have due from bank accounts, Federal funds sold on a principal basis, and direct or indirect loans to or investments in a correspondent bank. When calculating credit concentration levels, institutions should aggregate all exposures, including, but not limited to:

- Due from demand and time accounts,
- Federal funds sold on a principal basis,
- Over-collateralized amounts on repurchase agreements,
- Under-collateralized portions of reverse repurchase agreements,
- Net credit exposures on derivatives contracts,
- Unrealized gains on unsettled security transactions,
- Direct or indirect loans to or for the benefit of the correspondent, and
- Investments in the correspondent, such as stocks, subordinated debts, or trust preferred securities.

Identifying Funding Concentrations

The primary risk relating to funding concentrations is that an institution may need to replace the advances on short notice or on unfavorable terms. The risks may be more pronounced if funds are credit sensitive or the party advancing the funds has a weakened financial condition. Additionally, the level of risk relating to a funding concentration is likely to vary depending on the type and maturity of the funds and the structure of the recipient's overall sources of funds. For example, a concentration in overnight unsecured funding would raise different concerns than a concentration in secured long-term funding. Also, the risks of a concentration from a particular correspondent would be more significant if the level of funds constituted a high percentage of an institution's overall funding sources.

Calculating Credit and Funding Concentrations

When identifying credit and funding concentrations, institutions should calculate both gross and net exposures to individual correspondents and to groups of affiliated correspondents. Exposures are reduced to net positions to the extent the transactions are secured by the net realizable proceeds from readily marketable collateral or are covered by valid and enforceable netting agreements.

Monitoring Correspondent Relationships

Management should maintain written policies and procedures designed to prevent excessive exposure to correspondents in relation to the correspondent's financial condition. The depth and frequency of monitoring procedures may be more or less aggressive depending on the type and level of risk exposures. Institutions should implement procedures that ensure ongoing, timely reviews of correspondent relationships, include documentation requirements, and specify when risks that meet internal criteria are to be brought to the attention of the board of directors.

In monitoring correspondent relationships, institutions should specify internal parameters relative to information, ratios, or trends that will be reviewed for each correspondent on an ongoing basis such as:

- Deteriorating trends in capital, asset quality, or earnings,
- Increasing levels of other real estate owned,
- Significant use of volatile funding sources such as large CDs or brokered deposits,
- Downgrades in its credit ratings, if publicly traded, and
- Public enforcement actions.

Managing Correspondent Concentrations

Institutions should establish prudent internal concentration limits for each correspondent, as well as ranges or tolerances for each factor being monitored. Institutions should also develop contingency plans for managing risks when internal limits, ranges, or tolerances are met, either on an individual or collective basis. However, contingency plans should not rely on temporary deposit insurance programs for mitigating concentration risks.

Contingency plans should provide for the orderly reduction of identified concentrations over reasonable timeframes. Such actions may include, but are not limited to:

- Reducing the volume of uncollateralized/uninsured funds,
- Transferring excess funds to other correspondents,
- Requiring a correspondent to serve as an agent rather than as principal for Federal funds sold,
- Modifying credit and funding limits to a correspondent, and
- Specifying timeframes to meet targeted reductions for different types of exposures.

EXAMINATION PROCEDURES

Examiners should review correspondent relationships to ascertain whether an institution’s policies and procedures appropriately manage correspondent concentrations. Examiners should also review the adequacy and reasonableness of an institution's contingency plans for managing correspondent concentrations. The Examination Documentation Modules include examination procedures regarding the evaluation of the internal controls for cash, cash items, and correspondent bank accounts. Refer to the Other Assets and Liabilities and the Internal Routine and Controls sections for additional details.

INTRODUCTION

Institutions have historically relied on a reasonable investment in premises and equipment to successfully conduct business. A financial institution's physical presence in a community can bolster its public image and competitive position, and enhance convenience for customers. Institution offices can provide a platform for gathering deposits, originating credit, and serving the financial needs of its community. However, overinvestment in facilities may tie up capital and hinder earnings. Therefore, similar to other balance sheet assets, premises and equipment can pose risks to the institution and present a range of accounting issues that require appropriate oversight.

Premises include the cost, less accumulated depreciation, of land and buildings actually owned and occupied (or to be occupied) by the institution, its branches, and consolidated subsidiaries. This includes vaults, *fixed* machinery and equipment, parking lots, and real estate acquired for future expansion. Interest costs associated with the construction of a building are capitalized as part of the cost of the building. Institution premises also include leasehold improvements. Leasehold improvements comprise two types of accounts:

- Buildings constructed on leased property, and
- Capitalized disbursements directly related to leased properties, such as vault, renovation, and fixed machinery and equipment expenses.

Non-fixed equipment includes all *movable* furniture, fixtures, and equipment of the bank, its branches, and consolidated subsidiaries, including automobiles and other vehicles used in the conduct of business.

Premises and equipment are reported in the Call Report schedule RC-Balance Sheet, Item 6, *Premises and Fixed Assets*. The institution's ownership interest in premises and equipment of non-majority-owned corporations is also included in schedule RC, Item 6.

FIXED ASSETS ACCOUNTING

Fixed Assets - Owned

Fixed assets are reported at original cost and are depreciated over their estimated useful life, except for land which is not a depreciable asset.

Interest may be capitalized as part of the historical cost of acquiring assets that need time to be brought to the condition and location necessary for their intended use. The FASB Accounting Standards Codification (ASC) 835-20, *Capitalization of Interest*, calls for capitalization of interest costs associated with the construction of a building, if material. Such interest costs include both the actual interest incurred when the construction funds are borrowed and the interest costs imputed to internal financing of a construction project. The rate used to capitalize interest on internally financed projects in a reporting period shall be the rate(s) applicable to the bank's borrowings outstanding during the period. For this purpose, a bank's borrowings include interest-bearing deposits and other interest-bearing liabilities. The interest capitalized shall not exceed the total amount of interest cost incurred by the bank during the reporting period.

Fixed Assets - Leased

Institutions often lease premises and equipment. Lease obligations, which essentially reflect an extension of credit between the lessee and lessor may reflect material investments and can significantly, affect a bank's earnings.

ASC 840, *Leases*, is the current lease accounting standard for non-public entities and entities that have not adopted ASC 842, *Leases*. ASC 842 is effective for public business entities (as defined in U.S. GAAP) and will become effective for banks that are not public business entities, for fiscal years beginning after December 15, 2020, and interim reporting periods within fiscal years beginning after December 15, 2021. As such, a calendar year end non-public entity's first reporting period will be December 31, 2021. Early adoption is permitted.

In general, under ASC 840, a *capital lease* is recorded on the balance sheet (with interest and depreciation expensed on the income statement). An *operating lease*, on the other hand, is not reported on the balance sheet (it is disclosed in the footnotes of financial statements). Under ASC 840, operating leases are expensed using the straight-lined method on the income statement.

Under ASC 842, lessees are required to classify a lease as either a *finance lease* or an operating lease and, in most cases, identify and report them on the balance sheet. Although the term finance lease replaced the term capital lease that was previously used in ASC 840, the substance of recording and reporting the transactions remains the same.

Lease Accounting – ASC 840

In accordance with ASC 840, any lease entered into by a lessee institution, which at its inception meets <u>one or more</u> of the following four criteria must be accounted for as a property acquisition financed with a debt obligation, i.e., a capitalized lease. The criteria are:

- Ownership of the property is transferred to the lessee at the end of the lease term;
- The lease contains a bargain purchase option;
- The lease term represents at least 75 percent of the estimated economic life of the leased property; and
- The present value of the minimum lease payments at the beginning of the lease term is 90 percent or more of the fair value of the leased property to the lessor at the inception of the lease, less any related investment tax credit retained by or expected to be realized by the lessor.

If none of the criteria listed above is met, the lease should be accounted for as an operating lease. Normally, rental payments should be charged to expense as they become payable over the term of the operating lease.

Capitalized leases are to be reported in the Premises and Fixed Assets category of the Call Report. The amount capitalized equals the present value of the minimum required payments over the non-cancellable term as defined by the lease (plus the present value of payments required under a bargain purchase option, if any) less any portion of payments representing administrative expenses (such as insurance, maintenance, and taxes to be paid by the lessor). The property should be amortized according to the institution's normal depreciation policy (except, if appropriate, the amortization period should be the lease term) unless the lease involves land only, which is not a depreciable asset.

Lease Accounting – ASC 842

The core principle of ASC 842 is that a lessee should recognize the assets and liabilities that arise from leases. Under ASC 842, institutions are required to report a right-of-use (ROU) asset and a lease liability for most finance and operating leases. The ROU asset reflects the lessee's control over the leased item's economic benefits during the lease term. The measurement of the ROU asset includes the initial present value of lease payments plus certain third party, initial direct costs minus any lease incentives. The lessee records a related lease liability equal to the present value of the unpaid future lease payments.

The discount rate used to estimate the present value should be the rate implicit in the lease, or if that rate cannot be readily determined, the lessee's incremental borrowing rate (IBR). Many times a lessee may not have the necessary information, (such as the residual value estimate of the lessor or the initial direct cost incurred by the lessor) to determine the rate implicit in the lease. In such cases, the lessee may use its IBR.

While most leases will be reported on the balance sheet, ASC 842 permits a lessee to make an accounting-policy election to exempt leases with a term of one year or less (at the commencement date) from on-balance sheet recognition. The lease term generally includes the non-cancellable period of a lease as well as purchase options and renewal options that are reasonably certain to be exercised by the lessee, renewal options controlled by the lessor, and any other economic incentive for the lessee to extend the lease, which may include a related-party commitment.

Classification of Leases by the Lessee

ASC 842 requires a lessee to classify a lease (at the commencement date) as either a finance lease or an operating lease. When lease terms effectively transfer control of the underlying asset, the substance of the transaction is reflective of a sale, and the lease is classified as a finance lease by the lessee. Leases between related parties, such as a holding company and its financial institution are classified in the same manner as a lease with unrelated parties, i.e., the classification is based on the terms of the contract without considering the related party relationship. ASC 842 has five criteria for determining if a lease is a finance lease or an operating lease for the lessee.

A lessee is required to classify a lease as a finance lease when <u>one or more</u> of five criteria are met:

- The lease transfers ownership of the underlying asset to the lessee by the end of the lease term;
- The lease grants the lessee an option to purchase the underlying asset that the lessee is reasonably certain to exercise;
- The lease term is for the major part of the remaining economic life of the underlying asset. However, if the commencement date falls at or near the end of the economic life of the underlying asset, this criterion is not used for purposes of classifying the lease;
- The present value of the sum of the lease payments and any residual guarantee by the lessee that is not already reflected in the lease payments equals or exceeds substantially all of the fair value of the underlying asset; or
- The underlying asset is of such a specialized nature that it is expected to have no alternative use to the lessor at the end of the lease term.

If none of the five criteria are met and the lease is not a short-term lease in which the institution has elected the short-term lease policy election, the lessee is to classify the lease as an operating lease.

While the initial reporting of the ROU asset and lease liability will be the same regardless how the lease is classified (i.e., finance or operating lease), the reporting in the income statement differs. For a finance lease, a lessee is required to report interest expense on the lease liability using the effective interest method separately from the amortization expense on the ROU asset, typically on a straight-line basis. For an operating lease, a lessee is required to report a single lease cost. The lease expense is recorded on a straight-line basis over the lease term by adding the interest expense on the lease liability to the amortization of the ROU asset.

If a lease is not being correctly reported, appropriate comments should be included in the Report of Examination. The comments should remind management of the responsibility for accurate reporting and include the recommendation that competent outside assistance be obtained if the bank lacks satisfactory accounting expertise. In addition, if the amount incorrectly reported is significant, amended Call Reports may be necessary. Examiners are to verify whether bank decisions on how to report a lease are be fully supported and documented.

Sale-Leaseback Transactions

Sale-leaseback transactions occur when the owner of a property sells the property and subsequently leases it back from the buyer. The seller-leasee transfers legal ownership of the property to the buyer-lessor in exchange for consideration and then makes periodic rental payments to the buyer-lessor to retain use of the property.

Sale-Leaseback Accounting - ASC 840-40

If an institution sells premises or fixed assets and leases back the property, the lease shall be treated as a capital lease if it meets any one of the four capitalization criteria in ASC 840. Otherwise, the lease shall be accounted for as an operating lease. ASC 840-40, *Leases – Sale-Leaseback Transactions* provides guidance on the treatment of any gain or loss. A loss must be recognized immediately for any excess of net book value over fair value at the time of sale. In the event a bank sells a property for an amount less than its fair value, (for example, in order to obtain more favorable lease terms), the difference between the sale proceeds and fair value represents an additional loss that must be deferred and amortized over the life of the lease. Any gain resulting from a sale-leaseback transaction is generally deferred and amortized over the life of the lease. Accordingly, the general rule on deferral does not permit the recognition of all or part of the gain in income at the time of sale. Exceptions to the general rule do permit full or partial recognition of a gain at the time of the sale if the leaseback covers less than substantially all of the property that was sold or if the total gain exceeds the minimum lease payments.

Sale-Leaseback Accounting – ASC 842-40

For a sale-leaseback transaction to qualify for sales treatment under ASC 842, the transfer of the asset must meet the requirements for a sale in ASC 606, *Revenue from Contracts with Customers*. If the transaction qualifies as a sale in accordance with ASC 606 and the transaction would not be considered a failed sales-leaseback (as described below), any gain or loss on the sale is recognized immediately. However, an option for the seller-lessee to repurchase the asset would preclude accounting for the transfer of the asset as a sale unless both of the following criteria are met:

- The exercise price of the option is the fair value of the asset at the time the option is exercised, and
- There are alternative assets, substantially the same as the transferred asset, readily available in the marketplace.

The classification of a lease can affect whether a sale has occurred. In the event a leaseback is classified as a finance lease by the seller-lessee, or a sales-type lease by the buyer-lessor, then a sale has not occurred since a finance lease is essentially the purchase of an asset and a sales-type lease is essentially a sale of an asset. As such, the transaction would be considered a failed sales-leaseback.

If the transaction would not meet the conditions for a sale under ASC 606, or when the leaseback would not be classified as an operating lease (i.e., a failed sales-leaseback), the transaction would be accounted for as a financing arrangement. The transferor would not derecognize the asset and will continue to depreciate the asset as the legal owner. Any sales proceeds received would be reported as a liability.

For sale and leaseback transactions accounted for under ASC 840, the transition guidance does not require an entity to reassess whether the transaction would have qualified as a sale and a leaseback under ASC 842.

The accounting requirements for leases and sales of real estate are complex; and examiners who have questions on lease accounting or sale-leaseback transactions should refer to appropriate accounting resources or contact their regional accounting specialist.

ANALYSIS OF FIXED ASSETS

From an accounting standpoint, an investment in fixed assets is an essential cost of doing business. Attention should be focused on the adequacy of depreciation, the reasonableness of the overall commitment, and the current and prospective utilization of fixed assets in serving the present and future anticipated banking needs. Only under exceptional circumstances, such as the contemplated abandonment of institution premises, gross under-utilization due to obsolescence, closed bank situations, or other extreme circumstances, do market value considerations assume any significance in the analysis of fixed assets.

Depreciation Costs

Depreciation is an overhead cost of doing business as the item being depreciated will have to be replaced when it ceases to have utility. An acceptable depreciation program allocates the original cost of the fixed asset over its estimated useful life. Failure to follow a realistic schedule of fixed asset depreciation distorts both the balance sheet and income statement.

Institutions carry premises and equipment at cost less accumulated depreciation, and adjust the carrying amount for permanent impairments of value. Any method of depreciation or amortization conforming to accounting principles that are generally acceptable for financial reporting purposes may be used. However, depreciation for premises and fixed assets may be based on a method used for federal income tax purposes if the results would not be materially different from depreciation based on the asset's estimated useful life. Under normal circumstances, examiners should not need to prepare detailed depreciation schedules in accordance with the generally accepted accounting principles. In instances where tax depreciation and book depreciation are the same, and depreciation is accelerated for tax purposes only, detailed analysis of book values may be necessary to determine whether fixed assets are being appropriately depreciated.

Depreciation can result in a taxable, temporary difference if an institution uses the straight-line method to determine the amount of depreciation expense to be reported for book purposes but uses an accelerated method for tax purposes. In the early years, tax depreciation under the accelerated method will typically be larger than book depreciation under the straight-line method. During this period, a taxable, temporary difference originates. Tax depreciation will be less than book depreciation in the later years when the temporary difference reverses. Therefore, in any given year, the depreciation reported on the books will differ from that reported in the bank's tax returns. However, total depreciation taken over the useful life of the asset will be the same under either method.

Overinvestment

An over commitment in equipment and facilities can adversely affect earnings. A review of pertinent Uniform Bank Performance Report schedules will reveal how an institution compares to its peers in terms of total assets invested in premises and equipment, and the percent of operating income absorbed by occupancy expense. This information, though not in itself conclusive, can be a useful starting point in the analysis. Other considerations include the bank's business model and strategy. However, as long as commitments conform to state banking regulations and aggregate direct and indirect investments, including lease obligations, appear reasonable in relation to the institution's earnings performance and capacity, the decision as to what constitutes an appropriate fixed asset commitment should generally be left to management's discretion.

Fixed Asset Investments

A reasonable investment in premises and equipment is essential to conducting institution business. However, overinvestment in facilities or equipment may encumber capital and burden earnings. Consequently, many states impose limits on fixed asset investments. In order to keep their investments within statutory limits, some institutions have engaged in a variety of alternative arrangements, such as the organization of subsidiary or affiliate realty corporations, sale-leaseback transactions, and lease-purchase contracts. These arrangements are most common in connection with institution buildings, but in some instances are also used in connection with equipment.

The realty corporation arrangement typically calls for investment in a subsidiary corporation and capitalization by the bank of an amount within state limitations, with the subsidiary corporation financing the additional cost of banking facilities in the mortgage market. The facilities are then leased to the bank by the subsidiary corporation at a rent rate that usually coincides with the mortgage payments. In one type of affiliate setup, a group of the bank's directors may form a corporation to hold title to the property and lease it to the bank.

Examiners should determine whether any arrangements or transactions concerning fixed assets involve insiders and, if so, that such transactions are on substantially the same terms as those prevailing at the time for comparable transactions with non-insiders and do not involve more than normal risk or present other unfavorable features to the institution. In addition, examiners should consider whether insiders' use of institution owned/leased facilities and equipment (including vehicles) is prudent and in accordance with banking laws and employment agreements.

←

FIXED ASSET INSURANCE

Basic insurance policies and extended coverage endorsements typically provide coverage of risks caused by fire, lightning, explosion, windstorm, hail, civil unrest, aircraft or vehicle damage, etc. Broad form property insurance includes coverage for the risks identified in basic policies and adds additional coverage for falling objects, weight of ice, sleet, or snow, and accidental water damage.

The most common form of property insurance is special coverage, or *all risk* insurance. Special coverage policies may provide the best overall risk protection; however, the number and type of items excluded from coverage can be numerous. Typical exclusions include damage caused by government action, nuclear hazard, wars, floods, fungus, and pollution.

Regardless of the type of property insurance policies a bank carries, examiners should assess whether management thoroughly understands, periodically reviews, and documents their analysis of the adequacy of their institution's insurance coverage.

←

EXAMINATION PROCEDURES

The Other Assets and Liabilities Examination Documentation Module includes examination procedures regarding the evaluation of the reasonableness of investment in premises and equipment.

OTHER REAL ESTATE

Other real estate (ORE) consists of real property held for reasons other than to conduct bank business. Banks usually acquire ORE through foreclosure after a borrower defaults on a loan secured by real estate. Most states have laws governing the acquisition and retention of such assets.

Examiners should ensure management establishes appropriate policies and procedures for acquiring, holding, and disposing of ORE. Management should establish policies and procedures that:

- Protect a bank's interests in ORE while mitigating the impact on surrounding property values,
- Ensure ORE is accounted for in conformance with generally accepted accounting principles and Call Report Instructions, and
- Assure the institution's compliance with federal and state laws pertaining to holding ORE.

For regulatory reporting purposes, ORE includes:

- All real estate, other than bank premises, actually owned or controlled by the bank and its consolidated subsidiaries, including real estate acquired through foreclosure or deed in lieu of foreclosure, even if the bank has not yet received title to the property;
- Real estate collateral in a bank's possession, regardless of whether formal foreclosure proceedings have been initiated;
- Property originally acquired for future expansion but no longer intended for that purpose; and
- Foreclosed real estate sold under contract and accounted for under the deposit method of accounting.

Maintaining Other Real Estate

Part 364, Appendix A of the FDIC Rules and Regulations, Interagency Guidelines Establishing Standards for Safety and Soundness, requires institutions to identify problem assets and prevent deterioration in those assets. Institutions should maintain and protect ORE from deterioration to maximize recovery values. Typical expenses incurred during the ORE holding period relate to maintenance, tax, insurance, and miscellaneous costs.

Management should maintain ORE in a manner that complies with local property and fire codes. Other requirements, such as homeowner association covenants, may also require careful attention. Efforts to ensure an ORE property is maintained in a marketable condition not only improve an institution's ability to obtain the best price for the property, but also minimize liability and reputation risks.

Real estate taxes on ORE should be paid in a timely manner to avoid unnecessary penalties and interest.

Management should periodically review general insurance policies to determine if adequate hazard and liability coverage for ORE exists. If adequate general coverage is not in place, management should consider obtaining policies on each parcel of ORE. If an institution decides to self-insure, the decision should be board approved and appropriately documented.

Management should implement reasonable procedures for managing other miscellaneous expenses the institution may incur during the ORE holding period. These expenses could include, but are not limited to, sewer and water fees, utility charges, property management fees, and interest on prior liens.

OTHER REAL ESTATE ACCOUNTING

The accounting and reporting standards for foreclosed real estate are set forth in ASC 310-40, Receivables – Troubled Debt Restructurings by Creditors (formerly FAS 15, *Accounting by Debtors and Creditors for Troubled Debt Restructurings*), and ASC 360, Property, Plant, and Equipment (formerly FAS 144, *Accounting for the Impairment or Disposal of Long-Lived Assets*). The disposition of ORE is addressed in ASC 360-20, Property, Plant, and Equipment – Real Estate Sales (formerly FAS 66, *Accounting for Sales of Real Estate*). For regulatory reporting purposes, certain provisions of former AICPA Statement of Position (SOP) No. 92-3, *Accounting for Foreclosed Assets*, have been incorporated into the Call Report Instructions even though SOP 92-3 was rescinded subsequent to the issuance of FAS 144. Institutions must follow these provisions of SOP 92-3 when preparing their Call Reports.

Carrying Value

Call Report Instructions provide that foreclosed real estate received in full or partial satisfaction of a loan be recorded at the fair value less cost to sell the property. This fair value (less cost to sell) becomes the "cost" of the foreclosed real estate. If the recorded amount of the loan exceeds the "cost" of the property, the difference is a loss which must be charged to the Allowance for Loan and Lease Losses (ALLL) at the time of foreclosure or repossession. However, if an asset is sold shortly after it is received in a foreclosure or repossession, it may be appropriate to substitute the value received in the sale (net of the cost to sell the property) for the fair value, with any adjustments made to losses previously charged against the ALLL.

The recorded amount of a loan at the time of foreclosure is the loan balance adjusted for any unamortized premium or discount and unamortized loan fees or costs, less any amount previously charged off, plus recorded accrued interest. An asset received in partial satisfaction of a loan should be accounted for at its fair value less cost to sell, and the recorded amount of the loan should be reduced by the fair value (less cost to sell) of the asset at the time of foreclosure. Legal fees and other direct costs incurred by the bank in a foreclosure should be expensed as incurred.

After foreclosure, each foreclosed real estate parcel must be carried at the lower of (1) the fair value of the real estate minus the estimated costs to sell the real estate or (2) the “cost” of the real estate. If the real estate’s fair value minus the estimated costs to sell the real estate is less than its “cost,” the deficiency must be recognized as a valuation allowance against the real estate which is created through a charge to expense. The valuation allowance should thereafter be increased or decreased (but not below zero) for changes in the real estate’s fair value or estimated selling costs.

FINANCED SALES OF ORE

ASC 360-20, which applies to all transactions in which the seller provides financing to the buyer of real estate, establishes five different methods of accounting for dispositions of real estate. Failure to apply the correct method may result in misstating ORE and earning assets (i.e., loans). The deposit method is the only one of five methods where disposition of ORE and financing by the seller of real estate does not result in a sale and corresponding recognition of a loan. Brief descriptions of the five accounting methods for seller-financed dispositions of ORE are listed below. Refer to ASC 360-20 for more detailed definitions.

Full Accrual Method

Under this method, the disposition is recorded as a sale. Any resulting profit is recognized in full and the seller-financed asset is reported as a loan. The following conditions must be met in order to utilize this method.

- A sale has been consummated,
- The receivable is not subject to future subordination,
- The usual risks and rewards of ownership have been transferred, and
- The buyer's initial investment (down payment) and continuing investment (periodic payments) are adequate to demonstrate a commitment to pay for the property.

Guidelines for meeting the minimum down payment are set forth in Appendix A to ASC 360-20. These vary from five to 25 percent of the property sales value. These guideline percentages vary by type of property and are primarily based on the inherent risk assumed for the type and characteristics of the property. To meet the continuing investment criteria, the contractual loan payments must be sufficient to repay the loan over the customary loan term for the type of property involved. For instance, the customary repayment term for a loan secured by a single-family residential property could range up to 30 years.

Installment Method

This method recognizes a sale and corresponding loan. Profits are recognized as the bank receives payments. Interest income is recognized on an accrual basis, when appropriate.

The installment method is used when the down payment is not adequate to allow for use of the full accrual method, but recovery of the cost of the property is reasonably assured in the event of buyer default. Reasonable assurance of cost recovery may be achieved despite a small down payment if there is recourse to borrowers who have verifiable net worth, liquidity, and income levels, or if there is additional collateral pledged.

Cost Recovery Method

This method also recognizes a sale and corresponding loan and may apply when dispositions do not qualify under the full accrual or installment methods. No profit or interest income is recognized until either the aggregate payments exceed the recorded amount of the loan or a change to another accounting method is appropriate. The loan is maintained on nonaccrual status while this method is used.

Reduced-Profit Method

This method is appropriate in those situations where the bank receives an adequate down payment, but the loan amortization schedule does not meet the requirements of the full accrual method. Like the installment method, any profit is recognized as payments are received. However, profit recognition is based on the present value of the lowest level of periodic payments required under the loan agreement. This method is seldom used in practice because sales with adequate down payments are generally not structured with inadequate loan amortization requirements.

Deposit Method

The deposit method is used in situations where a sale of the real estate has not been consummated. It may also be used for dispositions that could be accounted for under the cost recovery method. Under this method a sale is not recorded and the asset continues to be reported as ORE. Furthermore, no profit or interest income is recognized. Payments received from the borrower are reported as a liability until sufficient payments or other events have occurred which allow the use of one of the other methods.

VALUATIONS AND CLASSIFICATION

Many states require institutions to obtain ORE appraisals or valuations when acquiring, holding, and/or disposing of real estate. Management should obtain ORE appraisals or valuations as required to ensure assets are reported at appropriate values and any material change in market conditions or physical property aspects is periodically recognized. If an institution is selling and financing the sale of an ORE parcel, Part 323 of the FDIC Rules and Regulations, Appraisals, and some state laws require updated appraisals or evaluations.

Examiners can test the general validity of appraised values by comparing the sale prices and appraised values of properties previously held. The fact of foreclosure is presumptive, but not conclusive, evidence that takeover value exceeds market or appraised value. Therefore, each parcel of ORE is to be reviewed and classified on its own merits.

Often a reliable appraisal may not be available or the appraisal on file may be suspect for various reasons. Nevertheless, a careful evaluation of all the relevant factors should enable the examiner to make an accurate and reliable judgment about a property's fair value less cost to sell with regard to classification. Any portion of the carrying value in excess of fair value less cost to sell should be classified Loss. The remaining carrying value should then be evaluated and adversely classified, if appropriate. Regulatory definitions of Substandard, Doubtful, and Loss (as discussed in the Loans section) should be utilized in the analysis of ORE holdings.

ORE VALUATION ALLOWANCE

As previously mentioned, a valuation allowance is established for each parcel of ORE during the holding period when the real estate's fair value minus the estimated costs to sell the real estate is less than the real estate's "cost." Call Report Instructions clarify that valuation allowances must be determined on an asset-by-asset basis. As a result, the individual valuation allowance should be subtracted from the related asset's "cost" to determine the property's carrying value, which is the amount subject to classification.

Valuation allowances on foreclosed properties being held for sale are not recognized as a component of regulatory capital. The risk-based capital standards permit only the "allowance for loan and lease losses" to be included in Tier 2 capital up to a maximum of 1.25% of risk-weighted assets.

INTRODUCTION

Assets and liabilities that are not reported in major balance sheet categories are generally reported in other asset or other liability categories. Although these items are listed in "other" categories, it does not mean the accounts are of less significance than items detailed in major categories. Intangible assets lack physical substance and are also reported separately on the balance sheet. The following pages include descriptions of common other assets, intangible assets, and other liabilities. Additional guidance and information is included in the Call Report Instructions and the Examination Documentation (ED) Module - Other Assets and Liabilities.

OTHER ASSETS

Accrued Income

All banks, regardless of size, shall prepare the Call Report on an accrual basis. Accrued income represents the amount of interest earned or accrued on earning assets and applicable to current or prior periods that has not yet been collected. Examples include accrued interest receivable on loans and investments. When income is accrued but not yet collected, a bank debits a receivable account and credits an applicable income account. When funds are collected, cash or an equivalent is debited, and the receivable account is credited.

The degree to which accrual accounts and practices are reviewed during an examination should be governed by the examination scope. When scoping examination procedures, examiners should consider the adequacy of a bank's internal control structure and the extent to which accrual accounting procedures are analyzed during audits.

When reviewing accrual accounts and practices, examiners should assess the general accuracy of the accrual accounting system and determine if accruals relate to items in default or to items where collection is doubtful. If accrued income accounts are materially overstated, examiners should consider the impact to overall profitability levels, classify overstated amounts as Loss, and recommend management amend Call Reports.

Tax Assets

Banks must estimate the amount of the current income tax liability (or receivable) to be reported on its tax returns. Estimating this liability (or receivable) may involve consultation with the bank's tax advisers, a review of the previous year's tax returns, the identification of significant expected differences between items of income and expense reflected on the Call Report and on the tax returns, and the identification of expected tax credits.

Deferred tax assets and liabilities represent the amount by which taxes receivable (or payable) are expected to increase or decrease in the future as a result of temporary differences and net operating losses or tax credit carryforwards that exist at the reporting date. When determining the current and deferred income tax assets and liabilities to be reported in any period, a bank's income tax calculation will contain an inherent degree of uncertainty surrounding the realizability of the tax positions included in the calculation.

A net deferred tax asset is reported if a debit balance results after offsetting deferred tax assets (net of valuation allowance) and deferred tax liabilities measured at the report date for a particular tax jurisdiction. If the result for a particular tax jurisdiction is a net credit balance, then a net deferred tax liability is reported. A bank may report a net deferred tax debit, or asset, for one tax jurisdiction, such as for federal income tax purposes, and also report at the same time a net deferred tax credit, or liability, for another tax jurisdiction, such as for state or local income tax purposes.

Temporary differences arise when an institution recognizes income or expense items on the books during one period, but records them for tax purposes in another period. For example a deductible temporary difference is created when a provision for loan and lease losses is expensed in one period for financial reporting purposes, but deferred for tax purposes until the loans are charged off in a subsequent period.

A bank sustains an operating loss when deductions exceed income for federal income tax purposes. An operating loss in a year following periods when the bank had taxable income may be carried back to recover income taxes previously paid. Banks may carry back operating losses for two years. Generally, an operating loss that occurs when loss carrybacks are not available (e.g., when losses occur in a year following periods of losses) becomes an operating loss carryforward. Banks may carry operating losses forward 20 years.

Tax credit carryforwards are tax credits that cannot be used for tax purposes in the current year, but which can be carried forward to reduce taxes payable in a future period.

Deferred tax assets are recognized for operating loss and tax credit carryforwards just as they are for deductable temporary differences. However, a bank can only recognize the benefit of a net operating loss, or a tax credit carryforward, to the extent the bank determines that a valuation allowance is not necessary. A valuation allowance must be recorded, if needed, to reduce the amount of deferred tax assets to an amount that is more likely than not to be realized. Examiners should obtain management's analysis and support for any deferred tax asset and valuation allowance reported for financial reporting purposes. Examiners should refer to the Call Report Glossary for guidance on income taxes and may contact the regional accounting specialist for further guidance in cases involving significant amounts of net deferred tax assets.

Part 325 of the FDIC Rules and Regulations, Capital Maintenance (Part 325), establishes limitations on the amount of deferred tax assets that can be included in Tier 1 capital. The maximum allowable amount is limited to the lesser of: the amount of deferred tax assets dependent upon future taxable income expected to be realized within one year of the calendar quarter-end date, based on projected future taxable income for that year; or ten percent of the amount of Tier 1 capital that exists before certain deductions. Refer to Part 325 for more details.

Interest-Only Strips

Accounting standards for interest-only strips receivable are set forth in ASC 860, Transfers and Servicing (formerly FAS 140, Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities, as amended by FAS 156, Accounting for Servicing of Financial Assets, FAS 166, Accounting for Transfers of Financial Assets, and certain other standards). ASC 860 defines interest-only strips receivable as the contractual right to receive some or all of the interest due on a bond, mortgage loan, collateralized mortgage obligation, or other interest-bearing financial asset.

Financial assets such as interest-only strips receivable, that can contractually be prepaid or otherwise settled in such a way that the holder of the financial asset would not recover substantially all of its recorded investment do not qualify to be accounted for at amortized cost. Interest-only strips subsequently measured at fair value like available-for-sale securities are reported as other assets. Alternatively, interest-only strips may be reported as trading securities. Refer to the Call Report Instructions for additional details.

Equities without Readily Determinable Fair Values

An equity security does not have a readily determinable fair value if sales or bid-and-asked quotations are not currently available on a securities exchange registered with the Securities and Exchange Commission and are not publicly reported by the National Association of Securities Dealers Automated Quotations or the National Quotation Bureau. Equity securities that do not have readily determinable fair values may have been purchased by a bank or acquired for debts previously contracted, and may include items such as paid-in stock of a Federal Reserve Bank, stock of a Federal Home Loan Bank, and stock of a bankers' bank. Refer to the Call Report Instructions for additional details.

Bank-Owned Life Insurance Policies

The purchase of bank-owned life insurance (BOLI) can be an effective way for institutions to manage exposures arising from commitments to provide employee compensation and pre- and post-retirement benefits, and to protect against the loss of key persons.

Consistent with safe and sound banking practices, institutions must understand the risks associated with BOLI and implement a risk management process that provides for the identification and control of such risks. A sound pre-purchase analysis, meaningful ongoing monitoring program, reliable accounting process and accurate assessment of risk-based capital requirements are all components of a comprehensive risk management process.

The ability of state chartered banks to purchase life insurance is governed by state law. The safe and sound use of BOLI depends on effective senior management and board oversight. An institution's board of directors must understand the complex risk characteristics of the institution's insurance holdings and the role this asset plays in the institution's overall business strategy.

Each institution should establish internal policies and procedures governing its BOLI holdings, including guidelines that limit the aggregate cash surrender value (CSV) of policies from, any one insurance company, as well as the aggregate CSV of policies from all insurance companies. In general, it is not prudent for an institution to hold BOLI with an aggregate CSV that exceeds 25 percent of its Tier 1 capital. Therefore, an institution that plans to acquire BOLI in an amount that results in an aggregate CSV in excess of this concentration limit, or any lower internal limit, should gain prior approval from its board of directors or the appropriate board committee. In this situation, management is expected to justify that any increase in BOLI resulting in an aggregate CSV above 25 percent of Tier 1 capital does not constitute an imprudent capital concentration.

Management should conduct a thorough pre-purchase analysis to help ensure that the institution understands the risks, rewards, and unique characteristics of BOLI. The nature and extent of this analysis should be commensurate with the size and complexity of the potential BOLI purchases and should take into account existing BOLI holdings.

A comprehensive assessment of BOLI risks on an ongoing basis is especially important for an institution whose aggregate BOLI holdings represent a capital concentration. Management should analyze the financial condition of BOLI insurance carriers, review the performance of BOLI products, and report their findings to the board at least annually. More frequent reviews may be necessary if management anticipates additional BOLI purchases, a decline in an insurance carrier's financial condition, policy surrenders, or changes in tax laws that could affect BOLI products or performance.

Examiners should review the Interagency Statement on the Purchase and Risk Management of Life Insurance (Interagency Statement) when assessing an institution's BOLI program. Examiners should closely scrutinize risk management policies and controls associated with BOLI assets when an institution holds BOLI in an amount that approaches or exceeds 25 percent of Tier 1 capital. An institution holding life insurance in a manner inconsistent with safe and sound banking practices is subject to supervisory action. Where ineffective controls over BOLI risks exist, or the exposure poses a safety and soundness concern, supervisory action against the institution, may include requiring the institution to divest affected policies, irrespective of potential tax consequences.

ASC 325-30, Investments-Other – Investments in Insurance Contracts (formerly FASB Technical Bulletin No. 85-4, Accounting for Purchases of Life Insurance, and Emerging Issues Task Force Issue No. 06-5, Accounting for Purchases of Life Insurance – Determining the Amount That Could Be Realized in Accordance with FASB Technical Bulletin No. 85-4) addresses the accounting for BOLI. Only the amount that could be realized under an insurance contract as of the balance sheet date (that is, the CSV reported by the carrier, less any applicable surrender charges not reflected in the CSV) is reported as an asset. If a bank records amounts in excess of the net CSV of the policy, then the excess should be classified Loss.

For risk-based capital purposes, an institution that owns general account permanent insurance should apply a 100 percent risk weight to its claim on the insurance company. If an institution owns a separate account policy and can demonstrate that it meets certain requirements, it may choose to apply a look-through approach to the underlying assets to determine the risk weight. Refer to Call Report Instructions, the ED Module - Bank-Owned Life Insurance (BOLI), and the Interagency Statement for further details.

MISCELLANEOUS ASSETS

Miscellaneous assets that are not reported in major Balance Sheet or Other Asset categories should be reported separately under all other assets in the Call Report. Examples include derivative instruments held for purposes other than trading that have a positive fair value, computer software, and bullion. Some of the more common miscellaneous assets are described below.

Prepaid Expenses

Prepaid expenses are the costs that are paid for goods and services prior to the periods in which the goods or services are consumed or received. When the cost is prepaid, the payment is recorded as an asset because it represents a future benefit to the bank. In subsequent periods the asset is reduced (expensed) as the goods or services are used or rendered. At the end of each accounting period, the bank makes adjusting entries to reflect the portion of the cost that has expired during that period. The prepayment is often for a service for which the benefit is spread evenly throughout the year. As the service is provided, the prepaid expense is amortized to match the cost to the period it benefits. Examples of prepaid expenses include premiums paid for insurance, advance payments for leases or asset rentals, payments for stationery or other supplies that will be used over several months, and retainer fees paid for legal services to be provided over a specified period.

Examiners should ensure management accurately adjusts prepaid expenses to reflect exhausted purchased goods or services. Prepaid expenses that are recorded and amortized in accordance with generally accepted accounting principles should not be adversely classified. However, any prepaid expense that is overstated should be classified Loss.

Repossessed Personal Property

Repossessed personal property such as automobiles, boats, equipment, and appliances, represents assets acquired for debts previously contracted. A bank that receives assets from a borrower in full satisfaction of a loan, such as a receivable from a third party, an equity interest in the borrower, or another type of asset (except a long-lived asset that will be sold), will account for the asset at its fair value. An asset received in partial satisfaction of a loan should be accounted for as described above and the recorded amount of the loan should be reduced by the asset's fair value less the cost to sell. .Examiners should assess repossessed assets individually for possible adverse classification.

Suspense Accounts

Suspense accounts, also known as interoffice or clearing accounts, are temporary holding accounts in which items are carried until they can be identified and their disposition to the proper account is made. For example, items are included in suspense accounts when a transaction is coded incorrectly and cannot be processed immediately, when an account number is missing on a loan or deposit transaction, or when a check drawn on a deposit account at the bank is not properly endorsed. Most suspense items are researched and cleared the following day. The balances of suspense accounts as of the report date should not automatically be reported as Other Assets or Other Liabilities. Rather, the items included in these accounts should be reviewed and material amounts should be reported appropriately in the Call Report. Moreover, banks should regularly reconcile suspense accounts. Stale suspense items should be charged off when it is determined that they are uncollectible and should be classified Loss in the report of examination.

Cash Items Not In Process Of Collection

In contrast to those cash items that are in process of collection, cash items that are not paid when presented are referred to as cash items that are not in the process of collection. In general, cash items that are not in the process of collection occur when the paying bank has refused payment after being presented with the cash item. Once payment has been refused, the cash item immediately becomes not in process of collection and is reclassified as an Other Asset. Cash items not in the process of collection are frequently kept in a suspense account. Although collection efforts will continue, when it becomes clear that the cash item will not be paid, the bank should promptly charge off the cash item. It is common for the payee bank to refuse payment if the customer's deposit account had insufficient funds, the check was improperly endorsed, the checking account on which the check is drawn has been closed, or for some other acceptable reason.

Other Accrued Interest Receivables

Accrued interest on securities purchased (if accounted for separately from accrued interest receivable in the bank's records) and retained interests in accrued interest receivable related to securitized credit cards is reported in all other assets in the Call Report. Accrued interest receivable amounts that are overstated should be classified Loss.

In a typical credit card securitization, an institution transfers a pool of receivables and the right to receive the future collections of principal (credit card purchases and cash advances), finance charges, and fees on the receivables to a trust. If a securitization transaction qualifies as a sale, then the selling institution removes the receivables that were sold from its reported assets and continues to carry any retained interests in the transferred receivables on its balance sheet. An institution should treat this accrued interest receivable asset as a retained (subordinated) beneficial interest. Accordingly, it should be reported in all other assets in the Call Report and not as a loan receivable.

For further guidance refer to the Interagency Advisory on the Accounting Treatment of Accrued Interest Receivable Related to Credit Card Securitizations and the Call Report Instructions.

Indemnification Assets

Indemnification assets represent the carrying amount of the right to receive payments from the FDIC for losses incurred on specified assets acquired from failed insured depository institutions or otherwise purchased from the FDIC that are covered by loss-sharing agreements. Despite the linkage between them, the acquired covered assets and the indemnification asset, are treated as separate units of account. Each covered asset is reported in the appropriate category on the balance sheet. The indemnification asset is recorded at its acquisition-date fair value and is reported in all other assets in the Call Report.

Examiners should ensure the acquiring institution's financial and regulatory reporting is appropriate for the covered assets and the indemnification asset. Refer to the Call Report Instructions for further details.

INTANGIBLE ASSETS

Goodwill and Other Intangible Assets

Goodwill is an intangible asset that is commonly recognized as a result of a business combination. .Other intangible assets resulting from a business combination, such as core deposit intangibles, purchased credit card relationships, servicing assets, favorable leasehold rights, trademarks, trade names, internet domain names, and non-compete agreements, should be recognized as an asset separately from goodwill. This discussion will focus on intangible assets acquired through business combinations.

Goodwill represents the excess of the cost of a company over the sum of the fair values of the tangible and identifiable intangible assets acquired less the fair value of liabilities assumed in a business combination accounted for in accordance with ASC 805, Business Combinations (formerly FAS 141 (revised 2007), Business Combinations).

Push down accounting is the establishment of a new accounting basis for a bank in its separate financial statements as a result of it becoming substantially wholly owned via a purchase transaction or a series of purchase transactions. When push down accounting is applied, any goodwill is reflected in the separate financial statements of the acquired bank as well as in any consolidated financial statements of the bank's parent.

When measuring Tier 1 capital for regulatory capital purposes, institutions generally must deduct goodwill and other intangible assets (other than mortgage servicing assets, nonmortgage servicing assets, and purchased credit card relationships eligible for inclusion in core capital). Refer to Part 325 for further information on the regulatory capital treatment of goodwill and intangible assets.

Accounting for Goodwill

After initial recognition, goodwill must be accounted for in accordance with ASC 350, Intangibles-Goodwill and Other (formerly FAS 142, Goodwill and Other Intangible Assets), which requires that goodwill be tested for impairment at least annually.

Goodwill is considered impaired when the amount of goodwill exceeds its implied fair value at the reporting unit level. An impairment loss must be recognized in earnings. After a goodwill impairment loss is recognized, the adjusted carrying amount of goodwill shall be its new accounting basis. Subsequent reversal of a previously recognized goodwill impairment loss is prohibited once the measurement of that loss is completed. Goodwill of a reporting unit must be tested for impairment annually and between annual tests if an event occurs or circumstances change that would more likely than not reduce the fair value of a reporting unit below its carrying amount. Examples of such events or circumstances include a significant adverse change in the business climate, unanticipated competition, a loss of key personnel, and an expectation that a reporting unit or a significant portion of a reporting unit will be sold or otherwise disposed. In addition, goodwill must be tested for impairment after a portion of goodwill has been allocated to a business to be disposed.

A bank may not remove goodwill from its balance sheet, for example, by selling or upstreaming this asset to its parent holding company or another affiliate.

Other intangible assets that have indefinite useful lives should not be amortized but must be tested at least annually for impairment. Intangible assets that have finite useful lives must be amortized over their useful lives and must be reviewed for impairment.

Refer to the Call Report Instructions for further details.

Servicing Assets

The right to service assets is represented by the contractual obligations undertaken by one party to provide servicing for mortgage loans, credit card receivables, or other financial assets for another. Servicing includes, but is not limited to, processing principal and interest payments, maintaining escrow accounts for the payment of taxes and insurance, monitoring delinquencies, and accounting for and remitting principal and interest payments to the holders of beneficial interests in the financial assets. Servicers typically receive certain benefits from the servicing contract and incur the costs of servicing the assets.

Servicing is inherent in all financial assets; however, it becomes a distinct asset or liability only when contractually separated from the underlying financial assets by sale or securitization with servicing retained or by a separate purchase or assumption of the servicing rights and responsibilities. Whenever an institution undertakes an obligation to service financial assets, a servicing asset or liability must be recognized unless the institution securitizes the assets, retains all of the resulting securities, and classifies the securities as held-to-maturity.

Accounting

Accounting and reporting standards for asset and liability servicing rights are set forth in ASC 860-50, Transfers and Servicing – Servicing Assets and Liabilities (formerly FAS 140, Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities, as amended by FAS 156, Accounting for Servicing of Financial Assets, and FAS 166, Accounting for Transfers of Financial Assets), and ASC 948, Financial Services-Mortgage Banking (formerly FAS 65, Accounting for Certain Mortgage Banking Activities, as amended by FAS 140).. Servicing assets result from contracts to service financial assets for which the servicing benefits (revenues from contractually specified servicing fees, late charges, and other ancillary sources) are expected to more than adequately compensate the servicer. Contractually specified servicing fees are all amounts that, per contract, are due to a servicer in exchange for servicing the financial assets and which would no longer be received by a servicer if the contract for servicing were shifted to another servicer.

A bank must recognize and initially measure at fair value a servicing asset or a servicing liability each time it undertakes an obligation to service a financial asset by entering into a servicing contract in either of the following situations:

- The bank's transfer of an entire financial asset, a group of entire financial assets, or a participating interest in an entire financial asset that meets the requirements for sale accounting; or
- An acquisition or assumption of a servicing obligation that does not relate to financial assets of the bank or its consolidated affiliates included in the Call Report.

If a bank sells a participating interest in an entire financial asset, it only recognizes a servicing asset or servicing liability related to the participating interest sold.

A bank should subsequently measure each class of servicing assets and servicing liabilities using either the amortization method or the fair value measurement method. Once a bank elects the fair value measurement method for a class of servicing, that election must not be reversed.

Under the amortization method, all servicing assets or servicing liabilities in the class should be amortized in proportion to, and over the period of, estimated net servicing income for assets (servicing revenues in excess of servicing costs) or net servicing loss for liabilities (servicing costs in excess of servicing revenues). The servicing assets or servicing liabilities should be assessed for impairment or increased obligation based on fair value at each quarter-end Call Report date. The servicing assets within a class should be stratified into groups based on one or more of the predominant risk characteristics of the underlying financial assets. If the carrying amount of a stratum of servicing assets exceeds its fair value, the bank should separately recognize impairment for that stratum by reducing the carrying amount to fair value through a valuation allowance for that stratum. The valuation allowance should be adjusted to reflect changes in the measurement of impairment subsequent to the initial measurement of impairment. For the servicing liabilities within a class, if subsequent events have increased the fair value of the liability above the carrying amount of the servicing liabilities, the bank should recognize the increased obligation as a loss in current earnings.

Under the fair value measurement method, all servicing assets or servicing liabilities in a class should be measured at fair value at each quarter-end report date. Changes in the fair value of these servicing assets and servicing liabilities should be reported in earnings in the period in which the changes occur.

Institutions that sell only a limited number of financial assets with servicing retained and do not otherwise actively purchase or sell servicing rights may determine that the servicing activity is immaterial. Typically, these institutions will have a relatively low volume of financial assets serviced for others and the value of any servicing assets and liabilities would likewise be immaterial. Management must provide a reasonable basis for not reporting servicing activity. Refer to the Servicing Liabilities section below and the Call Report Instructions for further details.

Valuation

The fair value of servicing assets and liabilities is determined in accordance with ASC 820, Fair Value Measurements and Disclosures (formerly FAS 157, Fair Value Measurements) that defines fair value and establishes a framework for measuring fair value. Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants in the asset's or liability's principal (or most advantageous) market at the measurement date. This value is often referred to as an exit price. ASC 820 establishes a three level fair value hierarchy that prioritizes inputs used to measure fair value based on observability. The highest priority is given to Level 1 (observable, unadjusted) and the lowest priority to Level 3 (unobservable).

Valuation techniques consistent with the market approach, income approach, and/or cost approach should be used to measure fair value, as follows:

The market approach uses prices and other relevant information generated by market transactions involving identical or comparable assets or liabilities. Valuation techniques consistent with the market approach include matrix pricing and often use market multiples derived from a set of comparables.

The income approach uses valuation techniques to convert future amounts (for example, cash flows or earnings) to a single present amount (discounted). The measurement is based on the value indicated by current market expectations about those future amounts. Valuation techniques consistent with the income approach include present value techniques, option-pricing models, and the multi period excess earnings method.

The cost approach is based on the amount that currently would be required to replace the service capacity of an asset (often referred to as current replacement cost). Fair value is determined based on the cost to a market participant (buyer) to acquire or construct a substitute asset of comparable utility, adjusted for obsolescence.

When the discounted cash flow approach is used to measure the fair value of servicing assets, a number of factors and assumptions are considered when projecting the potential income stream (net of servicing costs) generated by the servicing rights. This income stream is present valued using appropriate market discount rates to determine the estimated fair value of the servicing rights. These factors and assumptions, which should be adequately documented, include:

- Average loan balance and coupon rate,
- Average portfolio age and remaining maturity,
- Contractual servicing fees,
- Estimated income from escrow balances,
- Expected late charges and other possible ancillary income,
- Anticipated loan balance repayment rate (including estimated prepayment speeds),
- Direct servicing costs and appropriate allocations of other costs, as well as the inflation rate effect, and
- Delinquency rate and estimated out-of-pocket foreclosure and collection costs that will not be recovered.

Regulatory Capital

Part 325 provides information on the regulatory capital treatment of mortgage servicing assets and nonmortgage servicing assets.

For purposes of calculating Tier 1 capital, the balance sheet assets for mortgage servicing assets and nonmortgage servicing assets will each be reduced to an amount equal to the lesser of:

- 90 percent of the fair value of these assets; or
- 100 percent of the remaining unamortized book value of these assets (net of any related valuation allowances).

The total amount of mortgage servicing assets, nonmortgage servicing assets, along with purchased credit card relationships recognized for regulatory purposes (i.e., not deducted from assets and capital) is limited to no more than 100 percent of Tier 1 capital. In addition to the aggregate limitation on such assets, the maximum allowable amount of purchased credit card relationships and nonmortgage servicing assets, when combined, is limited to 25 percent of Tier 1 capital. These limitations are calculated before the deduction of any disallowed servicing assets, disallowed purchased credit card relationships, disallowed credit-enhancing interest-only strips, disallowed deferred tax assets, and any nonfinancial equity investments. In addition, banks may elect to deduct disallowed servicing assets on a basis that is net of any associated deferred tax liability.

Servicing Risk

Examiners should be aware of the risks that can affect an institution from the failure to follow the servicing rules related to securitized assets. While credit risk may appear to be of little or no concern, the mishandling of procedures in these transactions can affect a holder's ability to collect. Financial institutions perform roles as sellers, buyers, servicers, trustees, etc., in these types of transactions. Examiners should evaluate the potential risks that might arise from one or more of these roles. In most cases, the government agency that provided the guarantee or insurance against ultimate default will also impose guidelines and regulations for the servicer to follow. If the servicer or others involved in the servicing function fail to follow these rules and guidelines, then the government agency that is providing the guarantee or insurance may refuse to honor its commitment to insure all parties against loss due to default. It is necessary for the financial institution to have adequate policies and procedures in place to control and limit the institution's liability and exposure in this regard.

Examination Procedures

When assessing asset quality during onsite examinations and when reviewing merger applications, examiners and supervisory personnel should review the valuation and accounting treatment of servicing assets. The ED Module - Mortgage Banking contains various examination procedures and references for reviewing mortgage servicing assets.

OTHER LIABILITIES

Other Borrowed Money

Mortgages, liens, and other encumbrances on premises and other real estate owned, and obligations under capitalized leases, which the bank is legally obligated to pay, are reported as other borrowed money in the Call Report. Regardless of the mortgage amount outstanding on bank premises, the asset should be carried on the general ledger at historical cost net of accumulated depreciation. ASC 840 establishes generally accepted accounting principles regarding lease transactions that must be accounted for as a property acquisition financed with a debt obligation

Additional information on premises and leases is included in the Premises and Equipment section of this Manual.

Accrued Expenses

Expenses are also reported in the Call Report on the accrual basis of accounting that records revenues when realized or realizable and earned, and expenses when incurred. This attempt to match expenses incurred during a period to the revenues that they helped generate is known as the matching principle. At the end of each reporting period, but no less frequently than quarterly, bank management needs to make appropriate entries to record accrued expenses. Interest on deposits accrued through charges to expense during the current or prior periods, but not yet paid or credited to a deposit account, are reported as other liabilities in the Call Report. Likewise, the amount of income taxes, interest on nondeposit liabilities, and other expenses accrued through charges to expense during the current or prior periods, but not yet paid, are reported as other liabilities.

Servicing Liabilities

As noted under Servicing Assets, servicers typically receive certain benefits from a servicing contract and incur costs of servicing the assets. The accounting and reporting standards addressing servicing rights (i.e., assets and liabilities) are set forth in ASC 860-50. Servicing liabilities result from contracts to service financial assets for which the benefits of servicing are not expected to adequately compensate the servicer. Banks must initially measure a servicing liability at fair value and subsequently measure each class of servicing liabilities using either the amortization method or the fair value measurement method. The election of the subsequent measurement method should be made separately for each class of servicing liabilities. Refer to the Call Report Instructions for further details.

Deferred Tax Liabilities

As noted under Tax Assets, a net deferred tax liability is reported if a net credit balance results after offsetting deferred tax assets (net of valuation allowance) and deferred tax liabilities measured at the report date for a particular tax jurisdiction. A bank may report a net deferred tax debit, or asset, for one tax jurisdiction, and also report at the same time a net deferred tax credit or liability, for another tax jurisdiction.

Deferred tax liabilities are recognized for taxable temporary differences. For example, depreciation can result in a taxable temporary difference if a bank uses the straight-line method to determine the amount of depreciation expense to be reported in the Call Report but uses an accelerated method for tax purposes. In the early years, tax depreciation under the accelerated method will typically be larger than book depreciation under the straight-line method. During this period, a taxable temporary difference originates. Tax depreciation will be less than book depreciation in the later years when the temporary difference reverses. Other taxable temporary differences include the undistributed earnings of unconsolidated subsidiaries and associated companies and amounts funded to pension plans that exceed the recorded expense.

Allowance for Off-Balance Sheet Exposures

Each bank should maintain, as a separate liability account, an allowance at a level that is appropriate to cover estimated credit losses associated with off-balance sheet credit instruments such as loan commitments, standby letters of credit, and guarantees. This separate allowance should be reported as an other liability, not as part of the allowance for loan and lease losses. The allowance for credit losses on off-balance sheet exposures should meet the criteria for accrual of a loss contingency set forth in generally accepted accounting principles.

All Other Miscellaneous Liabilities

Examiners will encounter other miscellaneous liabilities not reported in major Balance Sheet or Other Liability categories that should be reported separately in all other liabilities in the Call Report. Examples include accounts payable, deferred compensation payable, dividends declared but not yet paid, and derivative instruments held for purposes other than trading that have a negative fair value.

INTRODUCTION

Off-balance sheet activities include items such as loan commitments, letters of credit, and revolving underwriting facilities. Institutions are required to report off-balance sheet items in conformance with Call Report Instructions. The use of off-balance sheet activities may improve earnings ratios because earnings generated from the activities are included in the income numerator, while the balance of total assets included in the denominator remains unchanged.

Examiners should review the risks and controls associated with off-balance sheet activities during examinations. Reviews should consider the adequacy of items such as:

- Policies, practices, and internal controls;
- Conformance with applicable laws and internal bank guidelines;
- Credit quality and collectability of off-balance-sheet credit items; and
- Board oversight and audit activities.

←

OFF-BALANCE SHEET LENDING ACTIVITIES

When reviewing off-balance sheet lending activities, examiners should apply the same general examination techniques they use when evaluating a direct loan portfolio. For example, examiners should consider the adequacy of internal controls and board-approved policies at banks with a material level of off-balance sheet lending activities. Comprehensive policies generally address issues such as underwriting standards, documentation and file maintenance requirements, collection and review procedures, officer lending limits and customer borrowing limits, board and loan committee approval requirements, and board reporting requirements. Generally, overall limits on contingent liabilities and specific sub-limits on various types of off-balance sheet lending activities, either as a dollar amount or as a relative percentage (such as a percent of total assets or capital), are also often addressed.

When evaluating individual credit lines, examiners should review all of a customer's borrowing arrangements with the bank (e.g., direct loans, letters of credit, and loan commitments). Other factors analyzed during direct loan reviews, such as collateral protection and the borrower's financial condition, repayment history, and ability/willingness to pay are also applicable when reviewing contingent liabilities such as letters of credit and loan commitments.

When analyzing off-balance sheet lending activities, examiners should evaluate the probability that lines will be funded and, if applicable, whether loss allowances adequately reflect off-balance sheet credit risks. Such allowances should not be included as part of the general allowance for loan and lease losses (ALLL). Credit exposures on financial instruments with off-balance sheet credit risk should be recorded separate from the ALLL related to a recognized financial instrument (i.e., an on-balance sheet financial asset). Allowances for off-balance sheet credit exposures are reported in Call Report Schedule RC-G - Other Liabilities.

Examiners should also consider standby letters of credit when determining legal limitations on loans to one borrower and compliance with Section 337.2(b) of the FDIC Rules and Regulations.

Letters of Credit

A letter of credit (LOC) is a document issued by a bank on behalf of its customer authorizing a third party to draw drafts on the bank up to a stipulated amount under specific terms and conditions. A letter of credit is a conditional commitment (except when prepaid by the account party) on the bank's part to pay drafts drawn in accordance with the document's terms. There are four basic types of letters of credit: travelers, sold for cash, commercial, and standby.

Travelers – A travelers letter of credit is addressed by the bank to its correspondents authorizing drafts by the person named in accordance with specified terms. These letters are generally sold for cash.

Sold for Cash – When a letter of credit is sold for cash, the bank receives funds from the account party at the time of issuance. This letter is not reported as a contingent liability, but rather as a demand deposit.

Commercial – A commercial letter of credit is issued to facilitate trade or commerce. Generally, drafts are drawn upon when the underlying transaction is consummated as intended. Commercial letters of credit not sold for cash represent contingent liabilities. Refer to the International Banking section of this Manual for further details on commercial letters of credit.

Standby – A standby letter of credit (SBLC) is an irrevocable commitment on the part of the issuing bank to make payment to a designated beneficiary. Payments to a beneficiary are guaranteed in exchange for an ongoing, periodic fee throughout the life of the letter. An SBLC can be either financial-oriented, where the account party is to make payment to the beneficiary, or performance-oriented, where a service is to be performed by the account party. SBLCs are issued for a variety of purposes, such as to improve the credit rating of a beneficiary, to assure performance under construction contracts, and to ensure the beneficiary satisfies financial obligations payable to major suppliers.

ASC Topic 460, Guarantees, clarifies that a guarantor is required to recognize, at the inception of a guarantee, a liability for the fair value of the obligation undertaken in issuing the guarantee. ASC Topic 460 applies to standby letters of credit, both financial and performance. Commercial letters of credit and other loan commitments, commonly thought of as funding guarantees, are not included in the scope of ASC Topic 460 because those instruments do not guarantee payment of a money obligation and do not provide for payment in the event of default by the account party.

While no particular form is required, SBLC documents generally contain certain descriptive information. The first item generally includes a separate binding agreement wherein the account party agrees to reimburse the bank for any payments made under the SBLC. The actual letter is often labeled as a standby letter of credit, specifies a stipulated amount, covers a specific period, and details relevant information that must be presented to the bank before any draws will be honored due to the account party's failure to perform. Most SBLCs are carefully worded so that the bank is not involved in making any determinations of fact or law at issue between the account party and the beneficiary.

The primary risks relative to SBLCs are credit risk (the possibility of default on the part of the account party), and funding risk (the potential inability of the bank to fund a large draw from normal sources). An SBLC is a potential extension of credit and should be evaluated in a manner similar to direct loans. The credit risk could be significant under an SBLC given its irrevocable nature, especially if the SBLC is written for an extended period. Generally, a bank can rescind a direct loan commitment to a customer if the customer's financial condition deteriorated and the loan commitment contained an adverse-change clause. However, such would not be applicable with an SBLC since it is an irrevocable agreement between the bank and the beneficiary.

An SBLC can be participated or syndicated. Unlike loans, however, the sale of SBLC participations does not diminish the total contingent liability of the issuing bank. The name of the issuing bank is on the actual letter of credit, and the bank must therefore honor all drafts whether or not the participants are willing or able to disburse their pro rata share. Syndications, on the other hand, represent legal apportionments of liability. If one bank fails to fulfill its obligation under the SBLC, the remaining banks are not liable for that bank's share.

Section 337.2(d) of the FDIC Rules and Regulations requires banks to maintain adequate controls and subsidiary records of SBLCs, comparable to records maintained on direct loans, so that a bank's total liability may be determined at all times. Banks are also required to reflect all SBLCs on published financial statements. Consistent with Section 337.2(d) credit files should reflect the current status of SBLCs, and adequate reports regarding the types and volume of SBLCs should be maintained. These reports enable management and the board to monitor credit risks and identify potential concentrations so that appropriate action can be taken, if needed, to reduce undue exposure.

Examiners should assess the need to adversely classify or designate as Special Mention an SBLC if draws under the facility are probable and credit weaknesses exist. For example, deterioration in the account party's financial condition could jeopardize performance under the letter of credit and result in a draw by the beneficiary. If a draw occurs, the offsetting loan to the account party may become a collection problem, especially if it is unsecured.

Loan Commitments

A loan commitment is a written agreement, signed by the borrower and bank, detailing the terms and conditions under which the bank will fund a loan. The commitment will specify a funding limit and have an expiration date. For agreeing to make the accommodation, the bank may require a fee and/or maintenance of a stipulated compensating deposit balance from the customer. A commitment can be irrevocable (like an SBLC facility) and operate as a contractual obligation by the bank to lend when requested by the customer. Generally, commitments are conditioned on the customer maintaining a satisfactory financial position and the absence of defaults in other covenants. A bank may also enter into an agreement to purchase loan commitments from another institution, which should be reflected as off-balance sheet items, until the sale is consummated. Loan commitments related to mortgage loans that will be held for sale are discussed in the Mortgage Banking Section below.

Some types of commitments are expected to be drawn upon, such as a revolving working capital line to fund operating expenses or a term loan facility for equipment purchases or developing a property. Other commitments serve as backup facilities, such as for commercial paper, whereby draws would not be anticipated unless the customer is unable to retire or roll over the issue at maturity.

Less detailed than a formal loan commitment, is a line of credit, which expresses to the customer, usually by letter, a willingness by the bank to lend up to a certain amount over a specified period. This type of facility is disclosed to the customer and referred to as *advised* or *confirmed* lines, in contrast to *guidance* lines, which are not made known to the customer, but are merely used by the bank as lending guidelines for internal control or operational purposes. Many lines of credit are cancelable if the customer's financial condition deteriorates, while others are simply subject to cancellation at the bank's option.

Disagreements can arise as to what constitutes a legally binding commitment on the part of the bank. For example, a credit arrangement could be referred to as a *revocable line of credit*, but at the same time, it may be a legally binding commitment to lend if consideration has been given by the customer and the terms of the agreement between the parties result in a contract. When appropriate, examiners should consider the extent of the bank's legal obligation to fund commitments designated as revocable to ensure that obligations are properly documented and legally defensible should the bank need to cancel a loan commitment.

Credit documentation often contains a *material adverse change* (MAC) clause, which is intended to allow the bank to terminate the commitment or line of credit arrangement if the customer's financial condition deteriorates. The extent to which a MAC clause is enforceable depends on whether a legally binding relationship continues if specific financial covenants are violated. Although the enforceability of MAC clauses may be subject to some uncertainty, such clauses may provide the bank with leverage in negotiations with the customer over issues such as requests for additional collateral or personal guarantees.

Whether a bank will fund a loan commitment or line of credit cannot always be easily determined; therefore, careful analysis is often necessary. A MAC clause may allow the bank to decline funding to a borrower that defaulted on a loan covenant. Some banks may decline funding requests if any covenant is broken, whereas others might be more accommodative and make advances unless a borrower appears likely to file bankruptcy. The procedures followed by the bank, in acceding to or denying funding requests involving adverse conditions commonly factor in a borrower's financial condition, credit history, and repayment prospects. These factors are also important considerations in the examiner's overall evaluation of credit risk.

Examiners should consider the type, volume, and anticipated funding of loan commitments and lines of credit when assessing a bank's funds-management program and rating the liquidity position. Examiners should review internal management reports estimating the amount of commitments that require funding over various periods. For further information, refer to the Liquidity and Funds Management section of this Manual.

TRANSFERS OF FINANCIAL ASSETS

Mortgage Banking

Commitments to originate mortgage loans that will be held for sale often include interest rate lock commitments. In general, rate lock commitments are agreements to extend credit to a borrower at a specified interest rate. The agreements, which can involve fixed or floating rate commitments, protect borrowers from rising interest rates while loan applications are being processed.

Interest rate lock commitments on mortgage loans that will be held for sale are derivatives and must be recorded at fair value *on* the balance sheet as either an asset or liability. The commitments are reported as over-the-counter written options on schedule RC-L, Derivatives and Off-Balance Sheet Items, along with its notional amount.

Banks often enter into an agreement with an investor to sell mortgage loans that are originated under mandatory-delivery or best-efforts contracts. Mandatory-delivery and best-efforts contacts that meet the definition of a derivative are reported on the balance sheet at fair value and on schedule RC-L as forward loan sales commitments. In lieu of entering into a best efforts or mandatory-delivery contract, a bank may use the securitization market as a facility for selling originated mortgage loans.

A bank may not offset derivatives with negative fair values (liabilities) against those with positive fair value (assets), unless the criteria for *netting* under U.S. GAAP have been satisfied. Further, a bank may not offset the fair value of forward loan sales commitments against the fair value of derivative loan commitments of mortgage loans held for sale because the commitments typically have different counterparties.

Commitments to originate mortgage loans that will be held for investment purposes and commitments to originate other types of loans require evaluation to determine whether the commitments meet the criteria of a derivative. Often, these commitments to lend will not meet the net settlement requirement under ASC Topic 815 and would not be considered derivatives. Unused portions of loan commitments not considered derivatives are reported as off-balance sheet items if the aggregate amount individually exceeds 10 percent of the bank's equity capital.

The accounting and reporting standards for derivative activities are set forth in ASC Topic 815, Derivatives and Hedging and in ASC Topic 948, Financial Services - Mortgage Banking. ASC Topic 815 requires all derivatives to be recognized on the balance sheet as either assets or liabilities at their fair value. Additional information is available in the Capital Markets Handbook, the Call Report Glossary, and the instructions for RC-L, Derivatives and Off-Balance Sheet Items.

Financial Assets Sold Without Recourse

Financial assets sold without recourse, where the bank has surrendered control and meets the other conditions of a sale under ASC Topic 860, are accounted for as loan sales. In the case of loan participations, the transfer of a portion of an entire financial asset must meet the definition of a participating interest. If the transfer of a portion of a financial asset qualifies as a participating interest, and the other conditions for sale are met, the bank is required to allocate the previous carrying amount of the loan between the participating interest sold and the participating interest it continues to hold based on relative fair values as of the date of transfer. Further discussion of loan participations is contained in the Loans section of this Manual.

If, as a result of a change in circumstances, a selling bank regains control of a transferred financial asset that was previously accounted for as a sale, the change should generally be accounted for in the same manner as a purchase of a transferred financial asset from the purchaser in exchange for the liability assumed. If a transfer of the financial asset does not meet the conditions for sale treatment, the transferring bank and the acquiring transferee shall account for the transfer as a secured borrowing with pledge of collateral.

Financial Assets Sold With Recourse

Financial assets transferred with recourse may or may not qualify for sales treatment under U.S. GAAP. In some circumstances, recourse provisions could mean that the transferred financial asset(s) have not been isolated beyond the reach of the transferring bank or its consolidated affiliates, i.e., the first criteria under ASC 860 for sales treatment. For example, when an insured bank transfers loan participation with recourse, the participation generally will not be considered isolated from the selling bank in the event of FDIC receivership. Section 360.6 of FDIC Rules and Regulations limits the Corporation's ability to reclaim loan participations *without recourse* as defined in the regulation, but does not limit the Corporation's ability to reclaim loan participations *with recourse*. Recourse provisions in loan participations sold prior to January 1, 2002, do not necessarily preclude sale accounting for the transfer. Refer to Manual Section 3.2 - Loans for additional information.

If the financial asset transfer, e.g., a loan sale, qualifies as a sale under ASC Topic 860, the bank shall remove the transferred asset from the balance sheet, recognize and initially measure the fair value of the servicing asset or liability (if applicable) and any other asset obtained or liability incurred, before recognizing the gain or loss on the sale. Transfers of financial assets not meeting sales treatment are accounted for as secured borrowings.

If an asset transfer that qualifies for sale treatment under U.S. GAAP contains certain recourse provisions, the transaction would be treated as an asset sale with recourse for purposes of reporting risk-based capital information in Schedules RC-R and RC-S within the Call Report. When reviewing assets sold with recourse, examiners should consider the recourse attributes when calculating risk-based capital. For further information, refer to the Call Report Glossary under Transfers of Financial Assets, ASC Topic 860, and Part 324 of the FDIC Rules and Regulations.

Recourse and Direct Credit Substitutes

A recourse obligation or direct credit substitute may arise when a bank transfers assets in a sale and retains an obligation to repurchase the assets or absorb losses. The repurchase or absorption of losses may be due to a default of principal or interest or any other deficiency in the performance of the underlying obligor. Recourse may also exist implicitly where a bank provides credit enhancements beyond any contractual obligation to support assets it sold.

When an examiner encounters recourse arrangements or direct credit substitutes (commonly found in securitization and mortgage banking operations), they should refer to the Call Report instructions, Part 324 of the FDIC Rules and Regulations, and ASC Topics 815 and 860.

OFF-BALANCE SHEET CONTINGENT LIABILITIES

Bankers Acceptances

The following discussion refers to the roles of accepting and endorsing banks in bankers acceptances. It does not apply to banks purchasing other banks' acceptances for investment purposes, which is described in the Other Assets and Liabilities section of this Manual. Bankers acceptances may represent either a direct or a contingent liability of the bank. If the bank creates the acceptance, it constitutes a direct liability that must be paid on a specified future date. If a bank participates in funding an acceptance created by another bank, the liability resulting from such endorsement is only contingent in nature. In analyzing the degree of risk associated with these contingent liabilities, the financial strength and repayment ability of the accepting bank should be considered. Further discussion of bankers acceptances is contained in the International Banking section of this Manual under the heading Forms of International Lending and in the Glossary of the Instructions for the Call Report.

Revolving Underwriting Facilities

A revolving underwriting facility (RUF) (also referred to as a note issuance facility) is a commitment by a group of banks to purchase, at a fixed spread over some interest rate index, the short-term notes that the issuer/borrower is unable to sell in the Euromarkets, at or below the predetermined rate. In effect, the borrower anticipates selling the notes as funds are needed at money market rates, but if unable to do so, has the assurance that credit will be available under the RUF at a maximum spread over the stipulated index. A lead bank generally arranges the facility and receives a one-time fee, and the RUF banks receive an annual commitment or underwriting fee. When the borrower elects to draw down funds, placement agents arrange for a sale of the notes and normally receive compensation based on the amount of notes placed. The notes usually have a maturity range of 90 days to one year and the purchasers bear the risk of any default on the part of the borrower. There are also standby RUFs, which are commitments under which Euronotes are not expected to be sold in the normal course of the borrower's business.

An inability to sell notes in the Euromarkets could result from financial deterioration of the borrower, or from volatile, short-term market conditions, which precipitate a call by the borrower on the participating banks for funding under the RUF arrangement. The evaluation of RUFs by the examiner should follow the same procedures used for reviewing loan commitments. An adverse classification should be accorded if it is determined that a loan of inferior quality will be funded under a RUF.

Standby LOC Issued By Another Depository Institution

Standby letters of credit issued by another depository institution (such as a correspondent bank), a Federal Home Loan Bank (FHLB), or another entity on behalf of a bank are potential future obligations for the bank that are reported as other off-balance sheet liabilities. Often, an FHLB will offer SBLC products to secure uninsured public deposits (i.e., deposit balances from public entities exceeding FDIC insurance limits, which may require additional protection due to state laws). Banks may choose this option as an alternative to pledging liquid assets such as U.S. Treasury securities. However, this does not mean the bank is free of asset encumbrance. As part of the SBLC agreement, the FHLB agreements may require collateral, but from a wider variety of assets, such as loans or other types of securities.

It is important to assess the implications for pledging requirements and contingent funding availability when a bank uses SBLCs to meet public deposit collateral requirements. The Call Report can serve as an initial source to gauge an institution’s involvement in this activity. Schedule RC-L, item 9.c requires banks to report SBLCs if the total amount is greater than 25 percent of total equity capital (reported in Schedule RC, item 27.a).

ADVERSELY CLASSIFIED CONTINGENT LIABILITIES

Category I contingent liabilities are defined as liabilities that will give rise to a corresponding increase in bank assets if the contingencies convert into actual liabilities. Such contingencies should be evaluated for credit risk and if appropriate, listed for Special Mention or adverse classification. This examination treatment does not apply to Category II contingent liabilities where there will be no equivalent increase in assets if a contingency becomes a direct liability. Examination treatment of Category II contingencies is covered under Contingent Liabilities in the Capital section of this Manual.

The classification of Category I contingencies is dependent upon two factors: the likelihood of the liability becoming direct and the credit risk of the potential acquired asset. Examiners should refer to the Report of Examination Instructions and the Bank of Anytown contained in this Manual for Report of Examination treatment when considering to list contingent liabilities as special mention or to assign adverse classifications.

Adverse classification and Special Mention definitions for direct loans are set forth in the Loans section of this Manual. The following adverse classification and Special Mention criteria should be viewed as a supplement to those definitions when evaluating contingent liability credit risk.

Special Mention – The chance of the contingency becoming an actual liability is at least reasonably possible, and the potentially acquired assets are considered worthy of Special Mention. An example would be the undrawn portion of a poorly supervised accounts receivable line where the drawn portion is listed for Special Mention.

Substandard – The chance of the contingency becoming an actual liability is at least reasonably possible, and the potentially acquired assets are considered no better than Substandard quality. Undisbursed loan funds in a speculative real estate venture in which the disbursed portion is classified Substandard and the probability of the bank acquiring the underlying property is high, would be an example of a Substandard contingency.

Doubtful – The chance of the contingency becoming an actual liability is probable, and the potentially acquired assets are considered of Doubtful quality. Undisbursed loan funds on an incomplete construction project wherein cost overruns or diversion of funds will likely result in the bank sustaining significant loss from disposing the underlying property could be an example of a Doubtful contingency.

Loss – The chance of the contingency becoming an actual liability is probable, and the potentially acquired assets are not considered of bankable quality. A letter of credit on which the bank will probably be forced to honor draws that are considered uncollectible is an example of a Loss contingency. A Loss classification normally indicates that a balance sheet liability (specific reserve) should be established to cover the estimated loss. For further information as to when a contingency should be reflected as a direct liability on the balance sheet, refer to ASC Subtopic 450-20, Contingencies, Loss Contingencies.

INTRODUCTION

The quality of management is probably the single most important element in the successful operation of a bank. For purposes of this section, management includes both the board of directors, which is elected by the shareholders, and executive officers, who are appointed to their positions by the board. In the complex, competitive, and rapidly changing environment of financial institutions, it is extremely important for all members of bank management to be aware of their responsibilities and to discharge those responsibilities in a manner which will ensure stability and soundness of the institution, so that it may continue to provide to the community the financial services for which it was created.

The extreme importance of a bank director's position is clearly emphasized by the fact that bank directors can, in certain instances, be held personally liable. Also, Congress has placed great emphasis on the role of bank management by passing legislation which allows regulatory authorities to utilize "cease and desist" actions against individuals (instead of solely against the institution) to assess civil money penalties (CMPs), and even remove an officer, director, or other person participating in the affairs of the bank when their gross negligence or disregard for safety and soundness considerations threatens the financial safety of the bank.

The board of directors is the source of all authority and responsibility. In the broadest sense, the board is responsible for formulation of sound policies and objectives of the bank, effective supervision of its affairs, and promotion of its welfare. On the other hand, the primary responsibility of executive management is implementation of the board's policies and objectives in the bank's day-to-day operations. While selection of competent executive management is critical to the successful operation of any bank, the continuing health, viability, and vigor of the bank are dependent upon an interested, informed and vigilant board of directors. Therefore, the main thrust of this section is devoted to the powers, responsibilities, and duties vested in bank directors.

MANAGEMENT/DIRECTORS

Selection and Qualifications of Directors

Being selected to serve as a bank director is generally regarded as an honor, for it often denotes an individual's reputation as being successful in business or professional endeavors, public spirited, and entitled to public trust and confidence. It is this latter attribute and the public accountability implicit therein that distinguishes the office of bank director from directorships in most other corporate enterprises. Bank directors are not only responsible to the stockholders who elected them, but must also be concerned with the safety of depositors' funds and the influence the bank exercises on the community it serves.

Various laws governing the election of board members emphasize the importance of a director's position. Statutory or regulatory qualifications usually include taking an oath of office, unencumbered ownership of a specific amount of the bank's capital stock, and residential and citizenship requirements. Other laws also pertain to the qualification and selection of directors. There are, for example, certain restrictions, prohibitions, and penalties relating to: interlocking directorates; purchases of assets from or sales of assets to directors; commissions and gifts for procuring loans; and criminal activities such as embezzlement, abstraction, willful misapplication, making false entries, and improper political contributions. These qualifications and restrictions have no counterpart in general corporate law and both illustrate and emphasize the quasi-public nature of banking, the unique role of the bank director, and the grave responsibilities of that office. The position of bank director is one, therefore, not to be offered or entered into lightly.

Aside from the legal qualifications, each director should bring to the position particular skills and experience which will contribute to the composite judgment of the group. Directors should have ideas of their own and the courage to express them, sufficient time available to fulfill their responsibilities, and be free of financial difficulties which might tend to embarrass the bank. The one fundamental and essential attribute, which all bank directors must possess without exception, is personal integrity. Its presence usually gives assurance of a well-intentioned, interested and responsible director capable of assuming the important fiduciary responsibilities of the office and representing fairly and equitably the diverse interests of stockholders, depositors and the general public. The Statement Concerning the Responsibilities of Bank Directors and Officers states that the duties of loyalty (to administer the affairs of the bank with candor, personal honesty and integrity) and care (to act as prudent and diligent business persons in conducting the affairs of the bank) are among the most important responsibilities of bank directors. Other desirable personal characteristics include: knowledge of the duties and responsibilities of the office; genuine interest in performing those duties and responsibilities to the best of their ability; capability to recognize and avoid potential conflicts of interest, or the appearance of same, which might impair their objectivity; sound business judgment and experience to facilitate understanding of banking and banking problems; familiarity with the community and trade area the bank serves and general economic conditions; and an independence in their approach to problem solving and decision making.

Powers, Duties and Responsibilities of Directors

The powers, duties and responsibilities of the board of directors are usually set forth in the applicable banking statutes and the bank's charter and bylaws. Generally speaking, the powers and responsibilities of bank directors include but are not limited to those discussed below.

Regulating the Manner in Which All Business of the Bank is Conducted

Directors must provide a clear framework of objectives and policies within which executive officers operate and administer the bank's affairs. These objectives and policies should, at a minimum, cover investments, loans, asset/liability and funds management, profit planning and budgeting, capital planning, internal routine and controls, audit programs, conflicts of interest, code of ethics, and personnel. Specialty areas, such as the Bank Secrecy Act (BSA), Information Technology (IT), Trust Department activities, and consumer compliance should also be subject to similar appropriate oversight and internal guidelines. Objectives and policies in most instances should be written and reviewed periodically to determine that they remain applicable. Examiners may encounter situations (often in smaller banks with control vested in one or a few individuals) where written policies have not been developed for these operational functions, and management is reluctant to do so on the grounds that such written guidelines are unnecessary. To a considerable degree, the necessity for written policies may be inferred from the results achieved by management. That is, if the examiner's assessment of the bank reflects that it is sound and healthy in virtually every important respect, it may be difficult to convince management of the need for formalized written policies. However, when deficiencies are noted in one or more aspects of a bank's operations, it is nearly always the case that absence of written and clearly defined objectives, goals, performance standards, and limits of authority is an important contributing factor. There are few better means of ensuring that directors are properly supervising the bank's affairs than by their direct participation in devising, enforcing, and modifying the institution's written guidelines on such matters as investments, loans, marketing, capital and profit planning. Moreover, it is recognized that the depth and detail of written policies may properly vary among banks, depending on the nature, scope and complexity of their operations. Therefore, it remains the FDIC's strongly held belief that all banks should have written policies which are readily understood by all affected parties, kept up-to-date, and relevant to the institution's needs and circumstances. While it is acceptable for a bank to obtain written policies from an outside source, it is the responsibility of management to ensure that the policies are suited to their bank and that the policies accurately describe the bank's practices. The board of directors should give final approval of the substantial content of policies.

The policies and objectives of the directorate should include provisions for adherence to the Interagency Guidelines Establishing Standards for Safety and Soundness set forth in Part 364, Appendix A, of the FDIC Rules and Regulations. These standards set specific guidelines for the safe operation of banks in the following areas: internal controls and information systems; internal audit system; loan documentation; credit underwriting; interest rate exposure; asset growth; asset quality; earnings; and compensation, fees, and benefits. The specific provisions for each area are discussed in further detail within the appropriate sections of this DSC Risk Management Manual of Examination Policies (Manual). Conformance to these standards may help identify emerging problems and correct deficiencies before capital becomes impaired. The standards, which should be viewed as minimum requirements, establish the objectives of proper operations and management, but leave specific methods of achieving these objectives to each institution.

Examiners should review the bank’s conformance to the safety and soundness standards at each examination. The nature, scope and risk of the institution’s activities should be considered when evaluating the adequacy of controls in each of the respective areas. Material deficiencies should be documented in appropriate sections of the Report of Examination.

Corporate Planning

A vital part of the responsibilities of directors is to set the future direction of the bank. Planning, organizing, and controlling are three fundamental dimensions of management. Planning, however, had not been a priority concern for a large part of the banking industry. This may have been due in part to the fact that the industry has historically been highly regulated and somewhat insulated from competitive pressures and sudden change. Dramatic changes in the structure, volatility and technology associated with the financial services market altered this situation and led to an emphasis on deregulating financial institutions. Increased competition and innovation consequently produced an environment characterized by uncertainty.

Sound planning is indispensable in dealing with this uncertainty and rapid change. In order to be effective, planning must be dynamic, carefully attended to, and well supported. Projections must be revised periodically as circumstances change and new strategies devised to meet stated objectives. An increasingly competitive marketplace suggests that an inadequate or ill-conceived planning process may be as much the cause of bank failure as poor loans.

The adequacy of a bank's planning process may be judged by considering questions such as:

- How formal is the bank's planning process?
- Who is involved? The board? Middle management?
- Is the plan based on realistic assumptions regarding the bank's present and future market area(s) and nontraditional competitive factors?
- Does the bank monitor actual performance against its plan?
- Does the bank consider alternative plans in response to changing conditions?

Although the focus must be on an evaluation of the process, the plan itself cannot be ignored if, in the examiner's judgment, the plan is predicated on assumptions which are inappropriate or unrealistic. This assessment must take into account the personnel and financial resources and operating circumstances and conditions unique to the bank being examined. It is emphasized that plotting the future direction of the institution is, properly, the responsibility of the board of directors and not examiners. However, when the goals and objectives chosen by directors are likely to result in significant financial harm to the bank, examiners must identify the deficiencies in the plan and attempt to effect necessary changes.

Absence of a satisfactory planning process or glaring weaknesses in the plan itself must be considered in the appraisal of bank management.

Appointing, Dismissing at Pleasure, and Defining the Duties of Officers

It is a primary duty of a board of directors to select and appoint executive officers who are qualified to administer the bank's affairs effectively and soundly. It is also the responsibility of the board to dispense with the services of officers who prove unable to meet reasonable standards of executive ability and efficiency.

Personnel Administration

Recruiting, training, and personnel activities are vital to the development and continuity of a quality staff. Some features of good personnel administration are a designated organization structure, detailed position descriptions, carefully planned recruiting, appropriate training and developmental activities, a performance appraisal system, quality salary administration, and an effective communications network.

Honestly and Diligently Administering the Affairs of the Bank

The board of directors is charged with the responsibility of conducting the affairs of the bank. It is not expected to directly carry out details of the bank's business; these may be delegated to senior officers. But they may not be delegated and forgotten. The power to manage and administer carries with it the duty to supervise; therefore, directors must periodically examine the system of administration they have established to see that it functions properly. Should it become obsolete, it should be modernized, or should the bank's officers fail to function as intended, the cause(s) should be determined and corrections made.

Observance of Applicable Laws

It is important for directors to ensure that executive management is cognizant of applicable laws and regulations; develop a system to effect and monitor compliance, which will likely include provisions for training and retraining personnel in these matters; and, when violations do occur, make correction as quickly as possible. Board members cannot be expected to be personally knowledgeable of all laws and regulations, but they should make certain that compliance with all laws and regulations receives high priority and violations are not knowingly committed by themselves or anyone the bank employs.

Avoiding Self-Serving Practices

Although somewhat independent from the responsibility to provide effective direction and supervision, the need for directors to avoid self-serving practices and conflicts of interest is of no less importance. Bank directors must place performance of their duties above personal concerns. Wherever there is a personal interest of a director that is adverse to that of the bank, the situation clearly calls for the utmost fairness and good faith in guarding the interests of the bank. Accordingly, directors must never abuse their influence with bank management for personal advantage, nor wrongfully employ confidential information concerning the bank's clients. The same principles with respect to self-serving practices and conflicts of interest apply to the executive management of the bank.

Paying Such Dividends as May Properly Be Paid

The board of directors has the responsibility of maintaining an adequately capitalized bank, and once this responsibility has been satisfied, the payment of dividends can and should receive consideration. Dividends represent the distribution of bank earnings to owners. Establishing the medium, rate, and date of payment must be based on the directors' overall assessment of the bank's financial condition.

Appropriate Internal Control System and Adequate Auditing Program

A sound framework of internal controls and a reliable and objective audit function are essential tools for bank directors. The existence of such enable directors to remain well informed of the adequacy, effectiveness, and efficiency of accounting, operating, and administrative controls and provide an assessment of the quality of ongoing operations. Establishment and oversight of such controls is the responsibility of the board of directors. Refer to the Internal Routines and Controls section for a complete discussion of these vital areas.

Management Information System (MIS)

The critical need for and dependence on information involves a concern and responsibility for the integrity of not only the specific information furnished, but the system that supplies it as well. Advances in technology have helped banks improve both information availability and models for analysis and decision making. Regardless of the technology employed, management is responsible for developing and implementing an information system that facilitates managerial activities. Review of these reports should be undertaken during onsite examinations to ascertain the accuracy of the information being provided.

An effective MIS is comprised of information from a number of sources, and the information must serve a number of users, each having various needs. The MIS must selectively update information and coordinate it into meaningful and clear formats. One possible approach would be to combine information from the bank's accounting system with other internal sources, such as personnel records, and include information from external sources regarding economic conditions, characteristics of the marketplace and competition, technology, and legal regulatory requirements. Quality, quantity and timeliness are factors that determine the effectiveness of management information systems.

Supervision by Directors

Supervision by directors does not necessarily indicate a board should be performing management tasks, but rather ensuring that its policies are being implemented and adhered to and its objectives achieved. It is the failure to discharge these supervisory duties, which has led to bank failures and personal liability of directors for losses incurred.

Directors' supervisory responsibilities can best be discharged by establishing procedures calculated to bring to their attention relevant and accurate information about the bank in a consistent format and at regular intervals. From this critical point, the remainder of a director's job unfolds. Directors who keep abreast of basic facts and statistics such as resource growth, capital growth, loan-to-deposit ratios, deposit mix, liquidity position, general portfolio composition, loan limits, loan losses and recoveries, delinquencies, etc., have taken a first, indispensable step in discharging their responsibilities. It is essential, therefore, that directors insist on receiving pertinent information about the bank in concise, meaningful and written form, and it is one of executive management's most important responsibilities to make certain directors are kept fully informed on all important matters and that the record clearly reflects this.

Directors' meetings that are conducted in a businesslike and orderly manner are a significant aid to fulfillment of the board's supervisory responsibilities. This requires, among other things, regular attendance (whether by actual or audio, video or other remote access). Absence without just cause is, like ignorance, not a valid defense. Moreover, a director's attendance should be an informed and intelligent one, and the record should reflect this. If directors dissent from the majority, they should, for their own protection, insist upon their negative vote being recorded along with reasons for their action.

Careful and consistent preparation of an agenda for each board meeting not only assists in the conduct of such meetings, but also provides board members reasonable assurance that all important matters are brought to their attention. Agenda items will vary from bank to bank depending on asset size, type of business conducted, loan volume, trust activities and so forth. In general, the agenda should include reports on income and expense; new, overdue, renewed, insider, charged-off and recovered loans; investment activity; personnel; and individual committee actions.

To carry out its functions, the board of directors may appoint and authorize committees to perform specific tasks and supervise certain phases of operations. In most instances, the name of the committee, such as loan, investment, examination, and, if applicable, trust, identifies its duties. Of course, utilization of the committee process does not relieve the board of its fundamental responsibilities for actions taken by those groups. Review of the minutes of these committees' meetings should be a standard part of the board meeting agenda.

Communication of facts to a board of directors is essential to sound and effective supervision. However, with the ever-broadening scope of modern banking and the increased complexity of banking operations, the ability of a board of directors to effectively supervise is becoming more difficult. Because of this, the use of outside personnel to provide management supervision is relatively common. While this does not release the board from its legal and implied responsibilities, it does provide an opportunity for management improvement through the use of these external sources. The bank holding company can play a very large role in the supervision of its individual banks. Bank holding companies which control a number of banks may be able to provide individual banks' boards with lending and investment counseling, audit and internal control programs or services, profit planning and forecasting, personnel efficiency reports, electronic data processing services, marketing strategy and asset appraisal reports. Banks that do not operate within a holding company organization are also able to obtain management assistance from various firms offering the above services. In the interest of quality supervision by a bank's board of directors, the use of outside advisors, while not releasing the board from its responsibilities, can be a valuable management tool.

Legal Liabilities of Directors

In general, directors and other corporate officers of a bank may be held personally liable for: a breach of trust; negligence which is the proximate cause of loss to the bank; ultra vires acts, or acts in excess of their powers; fraud; and misappropriation or conversion of the bank's assets. From the standpoint of imposing directors' liability where the facts evidence that fraud, misappropriation, conversion, breach of trust or commission of ultra vires acts is clearly shown, a relatively simple situation presents itself. Difficulties usually arise, however, in cases involving negligence (or breach of duty) which fall short of breach of trust or fraud.

Directors' liability for negligent acts is premised on common law for failure to exercise the degree of care prudent individuals would exercise under similar circumstances, and/or noncompliance with applicable statutory law, either or both of which cause loss or injury to the bank. Statutory liability is reasonably well defined and precise. Common law liability is somewhat imprecise since failure to exercise due care on the part of a director depends on the facts and circumstances of the particular case.

A director's duty to exercise due care and diligence extends to the management, administration and supervision of the affairs of the bank and to the use and preservation of its assets. Perhaps the most common dereliction of duty by bank directors is the failure to maintain reasonable supervision over the activities and affairs of the bank, its officers and employees. The actions and inactions listed below have been found to constitute negligence on the part of directors.

- An attitude of general indifference to the affairs of the bank, such as failing to hold meetings as required by the bylaws, obtain a statement of the financial condition of the bank, or examine and audit the books and records of the bank to determine its condition.
- Failure to heed warnings of mismanagement or defalcations by officers and employees and take appropriate action.
- Failure to adopt practices and follow procedures generally expected of bank directors.
- Turning over virtually unsupervised control of the bank to officers and employees relying upon their supposed fidelity and skill.
- Failure to acquaint themselves with examination reports showing the financial condition of a company to which excessive loans had been made.
- Assenting to loans in excess of applicable statutory limitations.
- Permitting large overdrafts in violation of the bank's internal policies or permitting overdrafts to insiders in violation of law.
- Representing certain assets as good in a Report of Condition when such assets were called to the directors' attention as Loss by the primary regulator and directions were given for their immediate collection or removal from the bank.

In the final analysis, liability of bank directors for acts of negligence rests upon their betrayal of those who placed trust and confidence in them to perform the duties of their office honestly, diligently and carefully. While applicable principles involving directors' negligence (or breach of duty) are easy enough to state, their application to factual situations presents difficulties. In essence, the courts have judged the conduct of directors "not by the event, but by the circumstance under which they acted" (Briggs v. Spaulding, 141 U.S. 132, 155(1890), 35L. Ed. 662, 672). Courts also have generally followed what may be called the rule of reason in imposing liability on bank directors, "lest they should, by severity in their rulings, make directorships repulsive to the class of men whose services are most needed; or, by laxity in dealing with glaring negligences, render worthless the supervision of director's over...banks and leave these institutions a prey to dishonest executive officers" (Robinson v. Hall, 63 Fed. 222, 225-226 (4th Cir. 1894)).

The following quotation represents a brief recapitulation of the law on the subject (Rankin v. Cooper, 149 Fed. 1010, 1013 (C.C.W.D. Ark. 1907) :

> "(1) Directors are charged with the duty of reasonable supervision over the affairs of the bank. It is their duty to use ordinary diligence in ascertaining the condition of its business, and to exercise reasonable control and supervision over its affairs. (2) They are not insurers or guarantors of the fidelity and proper conduct of the executive officers of the bank, and they are not responsible for losses resulting from their wrongful acts or omissions, provided they have exercised ordinary care in the discharge of their own duties as directors. (3) Ordinary care in this matter as in other departments of the law, means that degree of care which ordinarily prudent and diligent men would exercise under similar circumstances. (4) The degree of care required further depends upon the subject to which it is to be applied and in each case must be determined in view of all circumstances. (5) If nothing has come to their knowledge to awaken suspicion that something is going wrong, ordinary attention to the affairs of the institution is sufficient. If, upon the other hand, directors know, or by the exercise of ordinary care should have known, any facts which would awaken suspicion and put a prudent man on his guard, then a degree of care commensurate with the evil to be avoided is required, and a want of that care makes them responsible. Directors cannot, in justice to those who deal with the bank, shut their eyes to what is going on around them. (6) Directors are not expected to watch the routine of every day's business, but they ought to have a general knowledge of the manner in which the bank's business is conducted, and upon what securities its larger lines of credit are given, and generally to know of and give direction to the important and general affairs of the bank. (7) It is incumbent upon bank directors in the exercise of ordinary prudence, and as a part of their duty of general supervision, to cause an examination of the condition and resource of the bank to be made with reasonable frequency."

FEDERAL BANKING LAWS AND REGULATIONS PRIMARILY PERTAINING TO BANK DIRECTORS

Section 18(k) of the Federal Deposit Insurance Act (FDI Act) - Authority to Regulate or Prohibit Certain Forms of Benefits to Institution Affiliated Parties

Part 359 of the FDIC Rules and Regulations - Golden Parachutes and Indemnification Payments

Part 359, pursuant to Section 18(k), permits the FDIC to prohibit or limit, by regulation or order, golden parachute payments or indemnification payments. Refer to "Other Issues" within this section for additional information.

Section 39(c) of the FDI Act - Compensation Standards

This statute requires the FDIC to prohibit excessive compensation to executive officers, employees, directors, and principal shareholders as an unsafe and unsound practice. The definition of excessive compensation, as well as the specific prohibition required by Section 39(c), is found in Section III of Appendix A to Part 364, Standards for Safety and Soundness. Refer to "Other Issues" within this section for further information.

Section 32 of the FDI Act - Agency Disapproval of Directors and Senior Executive Officers of Insured Depository Institutions or Depository Institution Holding Companies

A troubled insured depository institution or troubled depository institution holding company may not add any individual to the board of directors or employ any individual as a senior executive officer if the appropriate Federal banking agency issues a notice of disapproval of such addition or employment before the end of the 90-day period beginning on the date the agency receives the required notice.

Section 19 of the FDI Act - Penalty for Unauthorized Participation by Convicted Individual

Section 19 of the FDI Act prohibits, without the prior written consent of the FDIC, a person convicted of any criminal offenses involving dishonesty or breach of trust or money laundering, or who has entered into a pretrial diversion or similar program in connection with a prosecution for such offense, from becoming or continuing as an institution-affiliated party (IAP), owning or controlling, directly or indirectly, an insured institution, or otherwise participating, directly or indirectly, in the conduct of the affairs of an insured institution.

The intent of Section 19 is not punitive. Rather, the purpose is to provide the applicant an opportunity to demonstrate that a person is fit to participate in the conduct of the affairs of an institution without posing a risk to its safety and soundness or impairing public confidence in that institution. The FDIC's policy is to approve applications in which this risk is absent. For additional guidance, refer to the FDIC Statement of Policy for Section 19 of the FDI Act.

Section 22(g) and 22(h) of the Federal Reserve Act - Loans to Executive Officers of Banks and Extensions of Credit to Executive Officers, Directors and Principal Shareholders of Member Banks

The Federal Reserve Board's Regulation O – Loans to Executive Officers, Directors and Principal Shareholders of Member Banks

Section 337.3 of the FDIC Rules and Regulations – Limits on Extensions of Credit to Executive Officers, Directors and Principal Shareholders of Insured Nonmember Banks

Sections 22(g) and 22(h) are incorporated into the FDI Act via Section 18(j)(2) and pertain to loans and extensions of credit by both member and nonmember banks to their executive officers, directors, principal shareholders and their related interests. Section 18(j)(2) does not apply to any foreign bank in the United States but does apply to the insured branch itself. It is a very important statute in the examination and supervisory process because it is aimed at prevention and detection of insider abuse, a common characteristic of failed or failing banks.

Part 215 of the Federal Reserve Board's Regulation O was issued pursuant to Sections 22(g) and 22(h) of the Federal Reserve Act. It requires that extensions of credit to executive officers, directors, principal shareholders or their related interests be made on substantially the same terms and follow credit underwriting procedures that are not less stringent than those prevailing at the time for comparable transactions with persons not covered by the regulation. Aggregate lending limits and prior approval requirements are also imposed by Regulation O. Moreover, payment of overdrafts of directors or executive officers is generally prohibited unless part of a written, preauthorized interest bearing, extension of credit plan or by transfer of funds from another account at the bank. The requirements, prohibitions and restrictions of Regulation O are important and examiners should be fully familiar with them. The complete text of the regulation is contained in the FDIC Rules and Regulations.

Section 337.3 of the FDIC Rules and Regulations makes Regulation O applicable to state nonmember banks and sets forth requirements for approval of extensions of credit to insiders. Specifically, prior approval of the bank's board of directors is necessary if an extension of credit or line of credit to any of the bank's executive officers, directors, principal shareholders, or to any related interest of any such person, exceeds the amount specified in the regulation when aggregated with the amount of all other extensions of credit or lines of credit to that person. This approval must be granted by a majority of the bank's directors and the interested party(ies) must abstain from participating directly or indirectly in the voting.

Any nonmember insured bank which violates or any officer, director, employee, agent or other person participating in the conduct of the affairs of a nonmember insured bank who violates any provision of Section 22(g) or 22(h) of the Federal Reserve Act may be subject to a CMP. In determining the amount of the penalty, the FDIC takes into account the financial resources and good faith of the bank or person charged, gravity of the violation, history if any of previous violations, and such other matters as justice may require. Examiners are reminded violations of Regulation O must be evaluated in accordance with the 13 factors specified in the Interagency Policy Regarding the Assessment of Civil Money Penalties by the Federal Financial Institutions Regulatory Agencies.

Part 348 of the FDIC Rules and Regulations - Management Official Interlocks

This act is contained in 12 U.S.C. 1823(k) and its general purpose is to foster competition. It prohibits a management official of one depository institution or depository holding company from also serving in a similar function in another depository institution or depository holding company if the two organizations are not affiliated and are located in the same area or if the two organizations are not affiliated and are very large, as defined in the regulation.

A number of exceptions allowing interlocking relationships for certain organizations and their affiliates are detailed in Part 348 of the Rules and Regulations. Under Section 8(e) of the FDI Act, the FDIC may serve written notice of intention to remove a director or officer from office whenever, in its opinion, such director or officer of an insured bank has violated the Depository Institution Management Interlocks Act.

Section 7(j) of the FDI Act and the Change in Bank Control Act of 1978

Section 7(j) of the FDI Act prohibits any person, acting directly or indirectly or through or in concert with one or more other persons, from acquiring control of any insured depository institution through a purchase, assignment, transfer, pledge, or other disposition of voting stock of the insured bank unless the appropriate Federal banking agency has been given 60-days prior written notice of the proposed acquisition. An acquisition may be made prior to the expiration of the disapproval period if the agency issues written notice of its intent not to disapprove the action. The term "insured depository institution" includes any bank holding company or any other company which has control of any insured bank. The term "control" is defined as the power, directly or indirectly, to direct the management or policies of an insured bank or to vote 25% or more of any class of voting securities of an insured bank. Willful violations of this statute are subject to civil money penalties of up to $1 million per day. This statute gives the FDIC important supervisory powers to prevent or minimize the adverse consequences that almost invariably occur when incompetent or dishonest individuals obtain positions of authority and influence in banks.

Section 737 of the Gramm-Leach-Bliley Act – Bank Officers and Directors as Officers and Directors of Public Utilities

This section of the Gramm-Leach-Bliley Act amends the Federal Power Act to preclude persons from serving both as an officer or director of a public utility and a bank except in certain circumstances. Dual service is permissible when the individual does not participate in any deliberations involved in choosing a bank to underwrite or market the securities of the utility, when the bank is chosen by competitive procedures, or when the issuance of securities by the public utility have been approved by all appropriate regulatory agencies.

Section 8 of the FDI Act

Among other things, Section 8 of the FDI Act provides the Federal banking agencies with the authority to take action to remove from office or prohibit an IAP from any further participation in the conduct of the affairs of any depository institution. Specifically, Section 8(e) and Section 8(g) are utilized in such proceedings. Actions taken under this authority represent serious charges with significant potential consequences. Therefore, outstanding guidelines should be closely followed during the examination process. For additional guidance, refer to Section 8 the FDI Act and the Formal Administrative Actions section of this Manual.

OTHER ISSUES

Indebtedness of Directors, Officers and Their Interests

The position of director or officer gives no license to special credit advantages or increased borrowing privileges. Loans to directors, officers and their interests must be made on substantially the same terms as those prevailing at the time for comparable transactions with regular bank customers. Therefore, management loans should be evaluated on their own merits. Their business operations will, in many instances, necessitate bank loans, and these will ordinarily be among a bank's better assets. Since directors usually maintain a deposit relationship with their bank, this carries with it an obligation to meet their reasonable and prudent credit requirements.

On the other hand, there have been many instances where improper loans to officers, directors, and their interests resulted in serious losses. Unfortunately, when the soundness of a management loan becomes questionable, an embarrassing situation usually results. That is, management loans frequently may not be subject to the same frank discussion accorded other loans. Bank directors may assent to such loans, despite knowledge that they are unwarranted, rather than oppose a personal or business friend or associate. Moreover, directors who serve on the board in order to increase their opportunities for obtaining bank credit are reluctant to object to credit extensions to their colleagues. Problems that occur with management loans have received considerable legislative attention and laws have been passed to curb abuses associated with the position of director or officer (i.e. Regulation O). However, while steps have been taken to reduce the potential for problems in this area, a review of the board's policies and actual practices regarding insider loans remains an important part of the examination process.

Conflicts of Interest

Examiners should be especially alert to any insider involvement in real estate projects, loans or other business activities that pose or could pose a conflict of interest with their fiduciary duties of care and loyalty to the bank. On occasion, loans are advanced to business associates involved in apparently unrelated projects where an insider nevertheless benefited. The involvement of bank insiders in these projects is sometimes not apparent since ownership is held in the form of "business trusts" or other entities without disclosure of the identity or personal guarantees of the principals. In order to help uncover these types of situations, examiners should routinely inquire of senior management, through incorporation in the "first day" letter or request, whether any of the following situations exist:

- Loans or other transactions existing at the bank in which an officer, director or principal stockholder (or immediate family member of each) of the bank holds a beneficial interest.
- Loans or other transactions in which an officer, director or principal stockholder (or immediate family member of each) of another depository institution holds a beneficial interest.

- Loans or other transactions at any other depository institution in which a bank officer, director, or principal stockholder (or immediate family member of each) holds a beneficial interest, either direct or indirect.
- Loans or other transactions in which an officer, director or principal stockholder (or immediate family member of each) has no direct interest but which involve parties with whom an insider has other partnership or business associations.
- Loans extended personally by officers, directors or principal stockholders (or immediate family member of each) to parties who are also borrowers from the bank or loans extended personally by any borrowing customers to an officer, director or principal stockholder of the bank.

If any of this information is not readily available, management should be requested to survey their officers, directors and principal stockholders, as necessary, to obtain it.

Examiners are also reminded to inquire into bank policies and procedures designed to bring conflicts of interest to the attention of the board of directors when they are asked to approve loans or other transactions in which an officer, director or principal stockholder may be involved. Where such policies and procedures are lacking or insufficient to reveal insider involvement before action is taken by the board, the bank should be strongly encouraged to remedy the deficiency. The board should also be encouraged to act specifically on any loan or other transaction in which insiders or their associates may be involved, either directly or indirectly, or because of business associations outside the loan or transaction in question. Moreover, the results of board deliberations on any matter involving a potential conflict of interest should be noted clearly in the minutes.

Examiners are also reminded to carefully scrutinize any loan or other transaction in which an officer, director or principal stockholder is involved. Such loans or other transactions should be sound in every respect and be in full compliance with applicable laws and regulations and the bank's own policies. Any deficiencies in credit quality or other aspects of the transaction should receive critical comment not only from an asset quality perspective but from a management perspective as well. More specifically, if a director has a personal financial interest in a loan or other transaction subject to adverse classification, the board should be urged to require that director to strengthen the credit sufficiently to remove the adverse classification within a reasonable time frame or resign from the board. In the event a principal stockholder or an officer who is not a director is involved in an adversely classified loan or other transaction, the board should be urged to assume special oversight over the loan or activity, either directly or through a committee of outside directors, with a view towards limiting any further exposure and moving aggressively to secure or collect any exposed balances as the circumstances may permit. There should be concern that these types of situations not only tend to compromise the credit standards of the lending institution and eventually may lead to losses, but that they can also lead to violations of civil and criminal laws.

Nonbanking Activities Conducted on Bank Premises

Many banks conduct nonbanking activities on bank premises by selling insurance (e.g. credit life, accident and health) in conjunction with loan transactions of the bank. When these nontraditional banking activities take the form of establishment of a new department or subsidiary of the bank, the benefit and profit is directly realized by the bank and its shareholders. However, when these activities are conducted on bank premises for the benefit of others, a bank may be deprived of corporate opportunity and profit. The FDIC has long taken the position that when nonbanking activities are conducted on bank premises either by bank personnel or others and when the benefit and profit do not flow directly to the bank, certain disclosures, approvals, and reimbursements must be made.

In all cases, the bank's directors and shareholders should be fully informed regarding the nonbanking activity conducted on bank premises. The operation should be approved by the bank's shareholders, and expenses incurred by the bank in connection with these operations formally approved by the board of directors annually. The bank should be adequately compensated for any expenses it incurs in furnishing personnel, equipment, space, etc. to this activity. It is recommended that bank management disclose completely to its bonding company any such nonbanking activity conducted on its premises. Management would also be well advised to obtain acknowledgement from the bonding company that such activities do not impair coverage under the fidelity bond. Finally, the conduct of nonbanking activity must be in conformance with applicable State statutes and regulations.

Situations where the bank is being deprived of corporate opportunity through the diversion of opportunity or profit, or inadequately compensated for the utilization of its resources should be discussed with bank management and commented upon in the Risk Management Assessment and the Examination Conclusions and Comments pages, if appropriate. Additionally, the absence of disclosure and approval to the bank's directors, shareholders, and bonding company should be discussed with management and covered in the aforementioned schedule(s). Finally, in those instances where the examiner believes, based on known facts, that a violation of applicable statutes or regulations has occurred, or where there is no question that a criminal violation has been committed, the matter should be handled in accordance with guidelines prescribed in other sections of this Manual.

Directors of Banks with Dominant Management Officials

Examiners should carefully consider the risks associated with institutions controlled by an official that dominates virtually all decisions involving the bank's policies and operations. A dominant official or policymaker is defined as an individual, or group of persons with close business dealings or otherwise acting together, that exerts an influential level of control or policymaking authority. The definition applies regardless of whether the individual or individuals involved have an executive officer title or receive compensation from the bank. The term is commonly used to describe situations where the institution's principal officer or shareholder dominates virtually all phases of the bank's policies and operations.

Examiners should not automatically view the presence of a dominant official negatively or as a supervisory concern. For example, in a small bank with limited staff, a dominant official may emerge because no one else at the bank has the skills or experience to operate the bank. However, the presence of a dominant official coupled with other risk factors such as ineffective internal controls, inadequate board oversight, or high-risk business strategies irrespective of established board policies, are a supervisory concern.

Situations involving dominant officials often involve boards that simply put their trust in the dominant officer and do not provide adequate oversight or effective challenge to management. This lack of effective challenge by boards may arise for various reasons. In particular, when first elected some directors may have a limited understanding of banking operations or of their oversight responsibilities and therefore feel dependent on operating management with more banking experience. Also, directors nominated by dominant officials may believe they owe allegiance to those dominant officials.

Operational risks inherent in these situations include the circumventing of internal controls by a dominant official. For example, a dominant official may simultaneously fulfill roles with conflicting responsibilities, such as chief executive officer (CEO) and chief financial officer, or serving as CEO and simultaneously chairing the audit committee. Situations involving dominant officials often involve boards that simply put their trust in the dominant officer and do not provide adequate oversight or effectively challenge management. This lack of effective challenge by boards may arise for various reasons.

Other risks inherent in these situations include dependence on a dominant, yet highly qualified official that is core to the operation of the institution. For example, the loss or incapacitation of the dominant official may deprive the bank of critical institutional knowledge and competent management. The loss of a dominant official may also result in short- or long-term business disruptions, productivity losses, or negatively affect profitability. Further, the process to replace a dominant official can be expensive and lengthy.

If examiners identify dominant officials at an institution, they should assess the official's level of influence. Such influence, along with other risk factors and risk management controls designed to mitigate these risks, should be considered during on-site examinations, off-site monitoring, and in the evaluation of management in connection with the regulatory and supervisory processes.

In addition to assessing internal controls the institution established to mitigate risks associated with dominant management officials, examiners should evaluate the effectiveness of compensating controls that protect the institution from the loss of the dominant official. Compensating controls include items such as key-person life insurance, business-continuity and succession planning, and cross-training programs.

When examiners encounter situations that involve dominant management officials, they should review the risk profile and control environment of the bank and assess whether:

- An appropriate segregation of duties and responsibilities is achieved or alternative actions are taken to mitigate the level of control exercised by the dominant individual;
- Director involvement in the oversight of policies and objectives of the bank is at an appropriate level;
- Board composition provides the bank with a range of knowledge and expertise, including, but not limited to, banking, accounting, and the major lending areas of the bank's target markets;
- There are a sufficient number of outside and independent directors;
- Committees of major risk areas exert a proper level of function, responsibility, and influence, and the value of the committees is exhibited in the decision-making process;
- A proper level of independence has been achieved for board committees of major risk areas, including, but not limited to, audit committees;

- An adequate audit committee has been established with only, or at least a majority of, outside directors;
- A need exists for the performance of annual financial audits by an independent certified public accounting firm if not already required under Part 363;
- A qualified, experienced, and independent internal auditor is in place;
- A proper segregation of the internal audit function is achieved from operational activities;
- An appropriate rationale is established regarding any changes to a bank's external auditors, including, but not limited to, a review of the audit committee minutes or a review of auditor notifications[1];
- An adequate written code of conduct, ethics, and conflict of interest policies have been established;
- A need exists for the bank's board to perform and report on an annual conflicts of interest and ethics review;
- A need exists for a bank to engage outside consultants to conduct an external loan review; and
- A proper segregation of the internal loan review process is established.

Report of Examination (ROE) Treatment

If a dominant official or policymaker is identified during an examination, examiners should describe related risks in the ROE. ROE comments should identify the dominant official and describe the official's influence and effect on the bank. Comments should also describe the level of board independence and oversight and the effectiveness of any mitigating controls. Supervisory recommendations relating to a dominant official, such as non-compatible duties or pursuit of high-risk business strategies, or concerns relating to ineffective board oversight or other mitigating controls should also be included in ROE comments.

Examiners should consider how identified weaknesses might affect the institution when assigning component and composite ratings. Concerns should not be disregarded when assigning ratings simply because the bank's current financial condition is satisfactory. Forward-looking supervisory practices require that examiners consider how current practices may affect the future condition of the bank. Additionally, the extent that the board of directors and management is affected by, or susceptible to, dominant influence or concentration of authority must be considered when assigning the Management rating. And finally, assignment of a composite rating may incorporate any factor that bears significantly on the overall condition and soundness of the financial institution.

When warranted, supervisory concerns should be addressed with informal or formal corrective programs. When concerns are particularly elevated or prior supervisory actions do not effect corrective actions, consideration should be given, after consultation with the regional office, to recommending changes to board composition or management to reduce a dominant official's impact on material decisions.

Advisory Directors

A naturally sensitive situation develops where the value of a director diminishes due to extensive outside commitments, illness, etc. Often such individuals do not wish to relinquish their position and the bank may be hesitant to request they do so. Some banks have met this situation by establishing a position of honorary director (or similar title) for persons who are no longer able to effectively fulfill the demanding duties of bank director. Generally, the honorary director attends board meetings as desired and offers advice on a limited participation basis, but has no formal voice or vote in proceedings, nor the responsibilities or liabilities of the office, except where there may be a continuing connection with a previous breach of duty as an official director.

Restrictions on Golden Parachute Payments and Indemnification Payments

Golden Parachute Payments

- The rule (Part 359) limits and/or prohibits, in certain circumstances, insured depository institutions, their subsidiaries, and their affiliated depository institution holding companies from agreeing to make or making golden parachute payments when the entity making the payment is "troubled," as defined in Section 303.101 of the FDIC Rules and Regulations.
- The rule does not restrict the payment of golden parachutes by healthy institutions, except that depository institution holding companies (including healthy ones) are prohibited from making golden parachute payments to IAPs of troubled subsidiary banks and savings associations.
- Several exceptions to the prohibition are included in the regulation; some are required by statute, others have been added by the FDIC. These exceptions are as follows:
  - Bona-fide deferred compensation plans.

[1] If the bank recently changed external auditors, examiners should assess the board/audit committee's rationale and review committee minutes and "change-in-auditor" notifications for possible opinion shopping and any other safety and soundness issues.

- Nondiscriminatory severance payment plans (for personnel reductions in force).
- Qualified pension or retirement plans.
- Payments pursuant to employee welfare benefit plans.
- Payments made by reason of termination caused by death or disability.
- Payments required by State statute or foreign law.

The final three listed exceptions require the approval of both the appropriate Federal banking agency and the FDIC:

- A troubled institution hiring new management .
- Severance payment in the event of an unassisted change in control.
- Any others on a case-by-case basis with the regulators' approval.

Indemnification Payments

- With regard to indemnification payments, Part 359 limits the circumstances under which an insured depository institution, its subsidiary, or affiliated depository institution holding company may indemnify institution affiliated parties IAPs for expenses incurred in administrative or civil enforcement actions brought by bank regulators. The circumstances where indemnification may be permitted are as follows:

  1. The institution's board of directors determines in writing that these four criteria are satisfied:

     - The IAP acted in good faith and in a manner believed to be in the best interests of the institution.
     - The payment will not materially adversely affect the safety and soundness of the institution.
     - The payment is limited to expenses incurred in an administrative proceeding or civil action instituted by a Federal financial institution's regulator.
     - The IAP agrees to reimburse the institution if he/she is found to have violated a law, regulation, or other fiduciary duty.

  2. An insurance policy or fidelity bond may pay the cost of defending an administrative proceeding or civil action. It may not pay a penalty or judgement.

- Under no circumstances may an institution or an insurance policy of the institution indemnify an IAP for any judgment or civil money penalty imposed in an action where the IAP is assessed a civil money penalty, is removed from office or prohibited from participating in the affairs of the institution, or is required to cease and desist from or take any affirmative action pursuant to section 8(b) of the FDI Act. However, partial indemnification is allowed for charges that are found in the IAP's favor as explained below under "Issues."

Issues

Generally speaking, the essence of Part 359 lies in its definitions of terms such as: golden parachute payment, bona fide deferred compensation plan, and prohibited indemnification payment, as well as certain significant exceptions to the general prohibitions.

The following are additional discussions on several issues encompassed in the regulation.

- The rule does not apply to contracts and agreements entered into prior to the effective date of the rule (April 1, 1996). However, the FDIC put institutions and their IAPs on notice in the proposed rule (March 29, 1995) that the FDIC will look unfavorably upon any golden parachute agreement which was entered into after the proposal, but before the date of the final rule, that attempts to circumvent the regulation. Appropriate orders should be pursued in such cases.

- With regard to indemnification payments, the majority of administrative or civil enforcement cases end in a settlement and no indemnification payment will be permitted unless charges are dropped. The parties concerned will have to factor in this cost of no indemnification in their decisions to settle or not.

  However, there are situations when an individual has been charged with several significant items of misconduct, etc., and then during the process a settlement is reached where only some of the infractions are admitted. The rule permits partial indemnification in those cases. There is a special case-by-case exception to allocate costs to the sets of charges with indemnification permitted for those that are dropped.

  Partial indemnification is not permitted in cases where an IAP is removed from office and/or prohibited from participating in the affairs of the institution.

  It is recognized that in many cases the appropriate amount of any partial indemnification will be difficult to ascertain with certainty. Although no prior regulatory consent is required, obviously the regulators are part of the settlement process. The process provides the opportunity for the regulators to give "non-objections" at the time of settlement, prior to the indemnification being made. As part of the settlement process, the bank should be required to provide from the attorney a statement containing a description of specifically attributable expenses. Concern should focus on the reasonableness of the allocations.

- If a golden parachute is prohibited to an individual leaving the institution, it is prohibited forever, even if the institution returns to health (after the individual has left the institution). There are ample exceptions and procedures for an individual who is leaving a troubled institution to avoid the prohibition if that individual has not contributed significantly to the demise of the institution. If an individual does not qualify for one of these exceptions, that individual should not benefit due to the institution reversing its course and returning to health after that individual has left the institution.

- Troubled institutions cannot apply for an exception to offer "white knight" parachutes to their current officers to not leave the institution. Rather it is to entice new management to join the institution by compensating for the uncertainty of joining a troubled institution. It is considered illogical for the FDIC to provide an exception to permit a troubled institution to offer a buyout to current management to get them to stay. The regulation does not prohibit an institution from offering golden parachutes to their current officers. It only prohibits the payment of a golden parachute if the individual leaves while the institution is troubled. On the contrary, it is believed to be of greater incentive that the only way the current officers' golden parachutes will be of value is if they stay and work to return the institution to health.

- Approval is required for a severance payment in the event of an unassisted change in control. A maximum payment of 12 months salary is permitted under this exception. Any requests for payments in excess of this amount (12 months salary) would have to be considered for approval under the general case-by-case exception.

  This exception is provided in recognition of the need for current management to be motivated to seek out acquirers. This exception is believed appropriate for cases where the IAP may not clearly demonstrate that all the factors for the general exception are evident, yet an acquisition of the troubled institution has been arranged and the acquirer is willing to make the otherwise prohibited golden parachute payment. On the other hand, if after consideration of the factors for the general case-by-case exception, the appropriate Federal banking agency and/or the FDIC determines it inappropriate to make the severance payment, an exception should not be approved.

Excessive Compensation

Section III of Part 364, Appendix A, prohibits the payment of excessive compensation, as well as compensation that could lead to material financial loss to an institution, as an unsafe and unsound practice. Furthermore, Section II of Part 364, Appendix A, urges institutions to maintain safeguards that prevent excessive compensation or compensation that could subject the institution to material financial loss. Excessive compensation is defined as when amounts paid are unreasonable or disproportionate to the services performed by an executive officer, employee, director, or principal shareholder. The following items should be considered when determining whether compensation is excessive:

- The combined value of all cash and noncash benefits provided to an individual;
- The compensation history of the individual and other individuals with comparable expertise;
- The financial condition of the institution;
- Compensation practices at comparable institutions, based on such factors as asset size, location, and the complexity of the loan portfolio or other assets;
- For post-employment benefits, the projected total cost and benefit to the institution;
- Any connection between the individual and any instance of fraud or insider abuse occurring at the institution; and
- Any other factors determined to be relevant.

The FDIC does not seek to dictate specific salary levels or ranges for directors, officers, or employees. In fact, Section 39 of the FDI Act prohibits establishing guidelines that set a specific level or range of compensation for bank insiders. The criteria listed above are designed to be qualitative rather than quantitative in order to grant an institution's directors reasonable discretion when structuring a compensation program.

Examiners should review the information used by the board to establish the compensation structure of the institution. The information should adequately explain the rationale for the system in place and should enable the board to consider the above items that determine whether compensation is excessive.

Gaining Access to Bank Records and Employees

Section 10(b)(6) of the FDI Act provides authority for examiners to make a thorough examination of any insured depository institution and to complete a full and detailed report of the institution's condition. In most instances, the executive officers of insured depository institutions cooperate with the requests of examiners. However, there are rare occasions when executive officers are extremely uncooperative, or refuse to provide access to bank records and employees that are essential to the evaluation of the condition of the institution. In such cases, this pattern of behavior by executive officers may be indicative of serious problems in the bank, including fraud, mismanagement, or insolvency. The Regional Office should be consulted when executive officers restrict access to bank records or employees.

Bank Owned Life Insurance (BOLI)

A number of banks use BOLI as a means of protecting against the loss of key employees or hedging employee compensation and benefit plans. However, the purchase of life insurance is subject to supervisory considerations and life insurance holdings must be consistent with safe and sound banking practices. Bankers should complete a thorough analysis before purchasing BOLI. Associated risks, minimum standards for pre-purchase analysis and basic guidelines are detailed in the Other Assets and Liabilities section of this Manual.

EVALUATION OF MANAGEMENT

A bank's performance with respect to asset quality and diversification, capital adequacy, earnings performance and trends, liquidity and funds management, and sensitivity to fluctuations in market interest rates is, to a very significant extent, a result of decisions made by the bank's directors and officers. Consequently, findings and conclusions in regard to the other five elements of the CAMELS rating system are often major determinants of the management rating. More specific considerations are detailed in the Basic Examination Concepts and Guidelines section of this Manual. However, while a bank's overall present condition can be an indicator of management's past effectiveness, it should not be the sole factor relied upon in rating management. This is particularly true when there is new management or when the bank's condition has been significantly affected by external factors versus internal decisions.

When significant problems exist in a bank's overall condition, consideration must be given to management's degree of responsibility. However, appropriate recognition should also be given to the extent to which weaknesses are caused by external problems (such as a severely depressed local economy). A distinction should be made between problems caused by bank management and those largely due to outside influences. Management of a bank whose problems are related to the economy would warrant a higher rating than management believed substantially responsible for a bank's problems, provided that prudent planning and policies are in place and management is pursuing realistic resolution of the problems. Management's ability becomes more critical in problem situations, and it is important to note management's policies and acts of omission or commission in addressing problems.

The extent to which mismanagement has contributed to areas of weakness is particularly relevant to the management evaluation. Similarly, positive economic conditions may serve to enhance a bank's condition despite weak or undocumented policies and practices. At a minimum, the assessment of management should include the following considerations:

- Whether or not insider abuse is in evidence;
- Existing management's past record of performance in guiding the bank;
- Whether loan losses and other weaknesses are recognized in a timely manner;
- Past compliance with supervisory agreements, commitments, orders, etc.; and
- Capability of management to develop and implement acceptable plans for problem resolution.

Assessment of new management, especially in a problem situation, is difficult. Performance by individuals at their former employment, if known to the examiner, may be helpful, but the examiner should assess each situation based on its particular circumstances. The management rating should generally be consistent with any recommended supervisory actions. A narrative statement supporting the management rating and reconciling any apparent discrepancies between the assigned rating and any recommended supervisory actions (or lack of recommended actions) should be included on the confidential pages of the examination report.

Examination procedures regarding the evaluation of management are included in the Examination Documentation Modules.

RATING THE MANAGEMENT FACTOR

Uniform Financial Institutions Rating System

The Federal Deposit Insurance Corporation and the other Federal Financial Institutions Examination Council (FFIEC) member agencies adopted a uniform interagency system for rating the condition and soundness of the nation's banks. The Uniform Financial Institutions Rating System involves an assessment of six critical aspects of a bank's condition and operations. Management and administration is one of those critical dimensions.

The capability of the board of directors and management, in their respective roles, to identify, measure, monitor, and control the risks of an institution's activities and to ensure a financial institution's safe, sound, and efficient operation in compliance with applicable laws and regulations is reflected in this rating. Generally, directors need not be actively involved in day-to-day operations; however, they must provide clear guidance regarding acceptable risk exposure levels and ensure that appropriate policies, procedures, and practices have been established. Senior management is responsible for developing and implementing policies, procedures, and practices that translate the board's goals, objectives, and risk limits into prudent operating standards.

Depending on the nature and scope of an institution's activities, management practices may need to address some or all of the following risks: credit, market, operating or transaction, reputation, strategic, compliance, legal, liquidity, and other risks. Sound management practices are demonstrated by active oversight by the board of directors and management; competent personnel; adequate policies, processes, and controls taking into consideration the size and sophistication of the institution; maintenance of an appropriate audit program and internal control environment; and effective risk monitoring and management information systems. This rating should reflect the board's and management's ability as it applies to all aspects of banking operations as well as other financial service activities in which the institution is involved.

The capability and performance of management and the board of directors is rated based upon, but not limited to, an assessment of the following evaluation factors:

- The level and quality of oversight and support of all institution activities by the board of directors and management.
- The ability of the board of directors and management, in their respective roles, to plan for, and respond to, risks that may arise from changing business conditions or the initiation of new activities or products.
- The adequacies of, and conformance with, appropriate internal policies and controls addressing the operations and risks of significant activities.
- The accuracy, timeliness, and effectiveness of management information and risk monitoring systems appropriate for the institution's size, complexity, and risk profile.
- The adequacy of audits and internal controls to: promote effective operations and reliable financial and regulatory reporting; safeguard assets; and ensure compliance with laws, regulations, and internal policies.
- Compliance with laws and regulations.
- Responsiveness to recommendations from auditors and supervisory authorities.
- Management depth and succession.
- The extent that the board of directors and management is affected by, or susceptible to, dominant influence or concentration of authority.
- Reasonableness of compensation policies and avoidance of self-dealing.
- Demonstrated willingness to serve the legitimate banking needs of the community.
- The overall performance and risk profile of the institution.

Ratings

A rating of 1 indicates strong performance by management and the board of directors and strong risk management practices relative to the institution's size, complexity, and risk profile. All significant risks are consistently and effectively identified, measured, monitored, and controlled. Management and the board have demonstrated the ability to promptly and successfully address existing and potential problems and risks.

A rating of 2 indicates satisfactory management and board performance and risk management practices relative to the institution's size, complexity, and risk profile. Minor weaknesses may exist, but are not material to the safety and soundness of the institution and are being addressed. In general, significant risks and problems are effectively identified, measured, monitored, and controlled.

A rating of 3 indicates management and board performance that need improvement or risk management practices that are less than satisfactory given the nature of the institution's activities. The capabilities of management or the board of directors may be insufficient for the type, size, or condition of the institution. Problems and significant risks may be inadequately identified, measured, monitored, or controlled.

A rating of 4 indicates deficient management and board performance or risk management practices that are inadequate considering the nature of an institution's activities. The level of problems and risk exposure is excessive. Problems and significant risks are inadequately identified, measured, monitored, or controlled and require immediate action by the board and management to preserve the soundness of the institution. Replacing or strengthening management or the board may be necessary.

A rating of 5 indicates critically deficient management and board performance or risk management practices. Management and the board of directors have not demonstrated the ability to correct problems and implement appropriate risk management practices. Problems and significant risks are inadequately identified, measured, monitored, or controlled and now threaten the continued viability of the institution. Replacing or strengthening management or the board of directors is necessary.

←

INTRODUCTION

Internal controls include the policies and procedures that financial institutions establish to reduce risks and ensure they meet operating, reporting, and compliance objectives. The board of directors is responsible for ensuring internal control programs operate effectively. Their oversight responsibilities cannot be delegated to others within the institution or to outside parties. The board may delegate operational activities to others; however, the board must ensure effective internal control programs are established and periodically modified in response to changes in laws, regulations, asset size, organizational complexity, etc.

Internal control programs should be designed to ensure organizations operate effectively, safeguard assets, produce reliable financial records, and comply with applicable laws and regulations. Internal control programs should address five key components:

- Control environments,
- Risk assessments,
- Control activities,
- Information and communication, and
- Monitoring.

These components must function effectively for institutions to achieve internal control objectives. This overview of internal control is described further in a report by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) titled *Internal Control-Integrated Framework*. Institutions are encouraged to evaluate their internal control program against this COSO framework.

←

INTERNAL CONTROL SYSTEMS

Part 364 of the FDIC Rules and Regulations establishes safety and soundness standards that apply to insured state nonmember banks and state-licensed, insured branches of foreign banks. Appendix A to Part 364 includes, among other things, general standards for internal controls, information systems, and audit programs. The standards require all financial institutions to have controls, systems, and programs appropriate for their size and the nature, scope, and risk of their activities. Internal controls and information systems should ensure:

- An organizational structure that defines clear lines of authority and responsibilities for monitoring adherence to established policies;
- Effective risk assessments;
- Timely and accurate financial, operational, and regulatory reports;
- Adequate procedures to safeguard and manage assets; and
- Compliance with applicable laws and regulations.

Many internal controls are programmed directly into software applications as part of data input, processing, or output routines. Other controls involve procedural activities standardized in an institution's policies. The relative importance of an individual control, or lack thereof, must be viewed in the context of other controls. Every bank is unique, and one set of internal procedures cannot be prescribed for all institutions. However, all internal control programs should include effective control environments, risk assessments, control activities, information systems, and monitoring programs.

If examiners determine internal routines or controls are deficient, they should discuss the deficiencies with the chief executive officer and the board of directors, and include appropriate comments in the report of examination (ROE).

Key Control System Components

Control Environment

The control environment begins with a bank's board of directors and senior management. They are responsible for developing effective internal control systems and ensuring all personnel understand and respect the importance of internal controls. Control systems should be designed to provide reasonable assurance that appropriately implemented internal controls will prevent or detect:

- Materially inaccurate, incomplete, or unauthorized transactions;
- Deficiencies in the safeguarding of assets;
- Unreliable financial and regulatory reporting; and
- Deviations from laws, regulations, and internal policies.

Risk Assessments

Risk assessments require proper identification, measurement, analysis, and documentation of significant business activities, associated risks, and existing controls. Financial risk assessments focus on identifying control weaknesses and material errors in financial statements such as incomplete, inaccurate, or unauthorized transactions. Risk assessments are conducted in order to identify, measure, and prioritize risks so that attention is placed first on areas of greatest importance. Risk assessments should analyze threats to all significant business lines, the sufficiency of mitigating controls, and any residual risk exposures. The results of all assessments should be appropriately reported, and risk assessment methodologies should be updated regularly to reflect changes in business activities, work processes, or internal controls.

Control Activities

Control activities include the policies and procedures institutions establish to manage risks and ensure pre-defined control objectives are met. Preventative controls are designed to deter the occurrence of an undesirable event. Detective controls are designed to identify operational weaknesses and help effect corrective actions. Control activities should cover all key areas of an organization and address items such as organizational structures, committee compositions and authority levels, officer approval levels, access controls (physical and electronic), audit programs, monitoring procedures, remedial actions, and reporting mechanisms.

Information and Communication

Reliable information and effective communication are essential for maintaining control over an organization's activities. Information about organizational risks, controls, and performance must be quickly communicated to those who need it. Technology systems and organizational procedures should facilitate the effective distribution of reliable operational, financial, and compliance-related reports. Clearly defined procedures should be developed that make it easy for individuals to report risks, errors, or fraud through formal and informal means. The procedures should include appropriate mechanisms for communicating, as needed, with external parties such as customers, regulators, shareholders, and investors.

Monitoring

Internal control systems must be monitored to ensure they operate effectively. Monitoring may consist of periodic control reviews specifically designed to ensure the sufficiency of key program components, such as risk assessments, control activities, and reporting mechanisms. Monitoring the effectiveness of a control system may also involve ongoing reviews of routine activities. The effectiveness of a periodic review program is enhanced when people with appropriate skills and authority are placed in key monitoring roles.

Control Standards

The control environment begins with the board of directors, which must establish appropriate control standards. The board of directors or an audit committee, preferably consisting entirely of outside directors (directors independent of operational duties), must monitor adherence to established directives.

Boards should establish policy standards that address issue such as decision-making authorities, segregation of duties, employee qualifications, and operating and recording functions. Key internal controls are described below.

Director Approvals

The board of directors should establish limits for all significant matters (such as lending and investment authorities) delegated to relevant committees and officers. Management should regularly provide financial and operational reports to the board, including standardized reports that detail policy exceptions, new loans, past due credits, concentrations, overdrafts, security transactions, etc. The board or a designated board committee should periodically review all authority levels and material actions. The key control objective is that the board is regularly informed of all significant matters.

Sound Personnel Policies

Sound personnel policies are critical components of effective control programs. The policies should require boards and officers to check employment references, hire qualified officers and competent employees, use ongoing training programs, and conduct periodic performance reviews.

Management should check the credit and previous employment references of prospective employees. The FBI is available to check the fingerprints of current and prospective employees and to supply institutions with criminal records, if any, of those whose fingerprints are submitted. Some insurance companies that write bankers' blanket bonds also offer assistance in screening officers and employees.

Pursuant to Section 19 of the Federal Deposit Insurance Act (FDI Act), the FDIC's written consent is needed in order for individuals to serve in an insured bank as a director, officer, or employee if they have been convicted of a criminal offense involving dishonesty, breach of trust, or money laundering.

Segregation of Duties

The possibility of fraud diminishes significantly when two or more people are involved in processing a transaction. A segregation of duties occurs when two or more individuals are required to complete a transaction. The segregation of duties allows one person's work to verify that transactions initiated by another employee are properly authorized, recorded, and settled. When establishing segregation-of-duty standards, management should assign responsibilities so that one person cannot dominate a transaction from inception to completion. For example, a loan officer should not perform more than one of the following tasks: make a loan, disburse loan proceeds, or accept loan payments. Individuals having authority to sign official checks should not reconcile official check ledgers or correspondent accounts, and personnel that originate transactions should not reconcile the entries to the general ledger. Additionally, information technology (IT) personnel should not initiate and process transactions, or correct data errors unless corrections are required to complete timely processing. In this situation, corrections should be pre-authorized, when possible, and authorized personnel should review and approve all corrections as soon as practical after the corrections are processed, regardless of any pre-authorizations.

Automated controls that act similar to manual segregation-of-duty controls can be written into software programs. For example, automated holds can be placed on customer accounts requiring special attention, such as dormant accounts or accounts with large uncollected funds. An automated hold allows tellers or customer service representatives to access an account for a customer, but requires the approval of a second person to authorize a transaction. In addition, certain modifications of data, such as master file changes, should require action from two authorized people before data is altered. When a hold on an account is added or removed, or when an action requiring supervisory approval occurs, exception reports should be automatically printed and reviewed by a designated person who is not involved with the activity. When properly designed, automated control methods are generally considered superior to manual procedures.

Joint Custody

Joint custody (a.k.a. *dual control*) refers to a procedure where two or more persons are equally accountable for the physical protection of items or records. For example, two keys or split combinations or passwords, under the separate control of different individuals, must be used in order to obtain access to vaults, files, or other storage devices. These custodial responsibilities should be clearly assigned and communicated to all affected employees. For the system to be effective, persons exercising control must guard their key, combination, or password carefully. If this is done, only collusion can bypass this control feature. Examples of items that should be under joint custody include reserve cash, negotiable collateral, certificated securities, trust assets, safekeeping items, reserve supplies of official checks, unissued electronic debit or credit cards, and unissued traveler's checks. Other examples include spare locks, keys, or combinations to night depositories, automated teller machines, safe deposit boxes, and tellers' cash drawers.

Vacation Policies

Banks should have a policy that requires all officers and employees to be absent from their duties for an uninterrupted period of not less than two consecutive weeks. Absence can be in the form of vacation, rotation of duties, or a combination of both activities. Such policies are highly effective in preventing embezzlements, which usually require a perpetrator's ongoing presence to manipulate records, respond to inquiries, and otherwise prevent detection. The benefits of such policies are substantially, if not totally, eroded if the duties normally performed by an individual are not assumed by someone else.

Where a bank's policies do not conform to the two-week recommended absence, examiners should discuss the benefits of this control with senior management and the board of directors and encourage them to annually review and approve the bank's actual policy and any exceptions. In cases where a two-week absent-from-duty policy is not in place, the institution should establish appropriate compensating controls that are strictly enforced. Any significant deficiencies in an institution's vacation policy or compensating controls should be discussed in the ROE and reflected in the Management component of the Uniform Financial Institutions Rating System (UFIRS).

Note: Management should consider suspending or restricting an individual's normal IT access rights during periods of prolonged absence, especially for employees with remote or high-level access rights. At a minimum, management should consider monitoring and reporting remote access during periods of prolonged absence.

Rotation of Personnel

Personnel rotations can provide effective internal controls and be a valuable part of overall training and business-continuity programs. The rotations should be planned by auditors and senior officers to ensure maximum effectiveness, but should not be announced ahead of time to the involved personnel. The rotations should be of sufficient duration to permit disclosure of irregularities due to error or fraud.

Pre-numbered Documents

Financial institutions should use sequentially numbered instruments wherever possible for items such as official checks and unissued stock certificates. In addition, institutions should maintain board meeting minutes on pre-numbered pages. Pre-numbered documents aid in proving, reconciling, and controlling used and unused items. Number controls should be monitored by a person who is detached from the particular operation; and unissued, pre-numbered instruments should be maintained under joint custody.

Cash Controls

Institutions should provide tellers with a separate cash drawer to which they have sole access. Common cash funds should not be used. An inability to fix responsibility in the event of a discrepancy could unnecessarily embarrass an employee or result in improper termination. Random cash drawer audits are also a fundamental control process.

Reporting Irregularities and Shortages

Management should develop procedures for the prompt reporting and investigation of irregularities and identified shortages. The results of investigations should be regularly reported to management and internal auditors, and when appropriate to fidelity insurers, regulators, and law enforcement agencies.

Business Continuity Plans

Business continuity planning requires banks to consider the impact of disruptions from natural disasters, technical problems, malicious activities (such as cyber attacks), pandemic incidents, etc. Directors and senior managers must develop business continuity plans to protect physical assets, safeguard financial records, and minimize operational interruptions.

Management should develop continuity plans for all significant operational areas based on the potential impact and probable occurrence of business disruptions. Disruptions include those with a high probability of occurrence and low impact to an institution, such as brief power interruptions, and to disruptions with a lower probability of occurrence but higher impact to an institution, such as tornadoes.

Business continuity plans should define key roles, responsibilities, and succession plans for various operational areas. Independent internal or external auditors should review the adequacy of the plans at least annually. Management should establish adequate training programs, periodically test the continuity plans, and report the test results and any recommendations for improvements to the board.

For additional details, refer to the FFIEC IT Examination Handbook titled Business Continuity Planning.

Accounting Systems

Efficient banking operations cannot be conducted without recordkeeping systems that generate accurate and reliable information and reports. Such systems are necessary to keep directors well informed and help officers manage effectively. Properly documented records are also necessary for meeting the needs of customers, shareholders, supervisory agencies, tax authorities, and courts of law.

Accounting systems should be designed to facilitate the preparation of internal reports that correspond with the responsibilities of individual supervisors and key employees. Records should be updated daily and reflect each day's activities separately from other days. Subsidiary records, such as those pertaining to deposits, loans, and securities, should balance with general ledger accounts.

While it is expected that records and systems will differ between banks, the books of every institution should be kept in accordance with well-established accounting and banking principles. In each instance, a bank's records and accounts should accurately reflect financial conditions and operating results. The following characteristics should be present in all accounting systems.

Audit Trail

Recordkeeping systems should be designed to enable the tracing of any transaction as it passes through accounts. Some of the more common recordkeeping deficiencies encountered during examinations include:

- General ledger entries are outdated or fail to contain adequate transaction descriptions;
- Customer loan records are incorrect, incomplete, or nonexistent;
- Cash item, overdraft, and suspense account records are deficient;
- Teller cash records are inadequately detailed;
- Security registers (electronic or manual) do not include all necessary information;
- Correspondent bank account reconcilements are outdated, lack complete descriptions, or fail to reflect the status of outstanding items;
- Account overage or shortage descriptions lack sufficient details;
- Letters of credit or other contingent liability records are inadequate; and
- Inter-office or intra-branch accounts are not properly controlled or monitored.

Accounting Manual

The uniform handling of monetary transactions is essential to the production of reliable financial reports. Management should establish accounting manuals and data processing guides that help employees consistently process and record transactions. Data processing guides are often provided by a servicer and supplemented by procedures written by bank personnel. The guides normally include instructions for compiling and reconciling source documents (such as checks and transaction tickets), instructions for processing the documents internally or transmitting them to a servicer for processing, and instructions for distributing output reports. Many systems allow employees to image source documents and transmit electronic files to a servicer for final posting. Regardless of the method used to process financial transactions, banks should have clear instructions for recording transactions and controlling the movement of documents and data between customers, the bank, and data processors.

←

AUDIT

Internal control and internal audit are related, but separate concepts. Internal control involves the systems, policies, and procedures that institutions design to control risks, safeguard assets, and achieve objectives. Internal audits help directors and officers evaluate the adequacy of internal control systems by providing independent assessments of internal controls, bank activities, and information systems.

Appropriately structured and monitored audit programs substantially lessen financial and operational risks, and all banks should adopt adequate audit programs. Ideally, such programs include ongoing internal audits and periodic external audits.

Internal Audit

The board of directors and senior management are responsible for ensuring internal control systems operate effectively. Internal audits provide a systematic way for institutions to assess the effectiveness of risk-management and internal-control processes. When properly structured and conducted, internal audits provide vital information about risks and controls so management can promptly address any identified weaknesses.

When examiners identify weaknesses in internal auditing programs, they should discuss their concerns with management and the board and include appropriate recommendations in the ROE.

General Standards

As noted previously, Appendix A to Part 364 of the FDIC Rules and Regulations includes general standards for internal controls, information systems, and audit programs. Internal audit programs should be appropriate for the size of an institution and the nature and scope of its activities, and provide for:

- Adequate monitoring of the internal control system;
- Independence and objectivity;
- Qualified personnel;
- Adequate testing and review of information systems;
- Adequate documentation of tests, findings, and corrective actions;
- Verification and review of management's actions to address material weaknesses; and
- Review by the audit committee or board of directors of the effectiveness of the internal audit function.

The 2003 Interagency Policy Statement on the Internal Audit Function and its Outsourcing discusses:

- Board and management responsibilities,
- Key characteristics of the internal audit function,
- Considerations at small institutions,
- Outsourcing arrangements,
- Independence considerations when external auditors also provide internal audit services,
- Independence requirements relating to public and non-public companies,
- Annual audit and reporting requirements based on an institution's size, and
- Examiner reviews of internal audit functions and related matters.

As previously noted, directors and senior management should have reasonable assurance that the internal control system prevents or detects inaccurate, incomplete, or unauthorized transactions; deficiencies in the safeguarding of assets; unreliable financial reporting; and deviations from laws, regulations, and internal policies.

To ensure the internal audit program is appropriate for the institution's current and planned activities, directors should consider whether their institution's internal audit activities are conducted in accordance with professional standards, such as the Institute of Internal Auditors' (IIA), *Standards for the Professional Practice of Internal Auditing*. These standards provide criteria to address independence, professional proficiency, scope of work, performance of audit work, management of internal audits, and quality assurance reviews. Furthermore, directors and senior management should ensure the internal audit program adequately reflects key functional characteristics regarding organizational structure; management, staffing, and audit quality; scope; communication; and contingency planning.

Organizational Structure - The internal audit function should be positioned so the board has confidence that internal auditors will act impartially and not be unduly influenced by senior officers or operation managers. The audit committee should oversee the internal audit function, evaluate performance, and assign responsibility for the internal audit function to an internal audit manager or a member of management. If the responsibility is assigned to a member of management, the individual should not be involved in daily operations to avoid potential conflicts of interest. The internal audit manager should understand the internal audit function and have no responsibility for operating the system of internal control. Ideally, the internal audit manager should report directly and solely to the audit committee regarding audit issues and administrative matters such as resources, budget, appraisals, and compensation. If the internal audit manager is placed under a dual reporting structure (reports to a senior officer and the audit committee), the board should weigh the risk of diminished independence against the benefit of reduced administrative burden. Additionally, the audit committee should document its consideration of the risk and any mitigating controls the institution has in place to maintain audit independence.

Management, Staffing, and Audit Quality - The internal audit manager is responsible for control risk assessments, audit plans, audit programs, and audit reports. Control risk assessments document the internal auditor's understanding of significant business activities and associated risks. These assessments typically analyze the risks inherent in each significant business activity, mitigating control processes, and any residual risks to the institution. Internal audit plans should be based on the findings of the control risk assessments. The plans should include a summary of key internal controls within each significant business activity, the timing and frequency of planned internal audit work, and the resource budget. Internal audit programs should describe audit objectives and list the procedures to be performed during each internal audit review. Audit reports should generally present the purpose, scope, and results of the audit including findings, conclusions, and recommendations. Workpapers that document the work performed and support the audit report should be maintained.

Ideally, the internal audit function's only role should be to independently and objectively evaluate and report on the effectiveness of an institution's risk management, control, and governance processes. The role should not include business-line oversight of control activities, such as approving or implementing operating policies or procedures. The audit committee should ensure that any consulting type work performed (e.g., providing advice on mergers, acquisitions, new products, services, internal controls, etc.) by the internal auditor(s) does not interfere or conflict with the objectivity of monitoring the internal control system.

The internal audit function should be staffed and supervised by people with sufficient expertise to identify operational risks and assess the effectiveness of internal controls. Internal audit policies, procedures, and work programs should be commensurate with the size and complexity of the internal audit department and institution.

Scope - The frequency and extent of internal audit review and testing should be consistent with the nature, complexity, and risk of the institution's balance sheet and off-balance sheet activities. At least annually, the audit committee should evaluate and approve internal audit's control risk assessment(s), the scope of audit plans, and how much the audit manager relies on the work of outside vendors. The audit committee should also periodically review internal audit's adherence to approved audit plans and should consider expanding internal audit work if significant issues arise or material changes occur in the institution's structure, activities, or risk exposures.

The audit committee and management are responsible for determining the extent of auditing required to effectively monitor the internal control system. The expense of having a full-time audit manager or auditing staff is likely justified at institutions with complex structures or high-risk operations. However, the cost of having a full-time audit manager or staff may be prohibitive for institutions with less complexity and risks. Nevertheless, institutions without an internal audit staff can maintain an objective internal audit function by implementing comprehensive, independent reviews of significant internal controls. To be effective, competent individuals should design review procedures, and the individuals directing or performing the reviews must not be responsible for managing or operating the controls under review. The person completing the control reviews should report findings directly to the audit committee. The audit committee should evaluate the findings and ensure senior management takes appropriate action to correct any identified deficiencies.

Communication - Directors and senior management should encourage open discussions and critical evaluations of identified control weaknesses and any proposed solutions. Internal auditors should immediately discuss internal control weaknesses or deficiencies with the appropriate level of management. Significant matters should be promptly reported directly to the board of directors or its audit committee with a copy of the written report provided to senior management. Moreover, the board or audit committee should provide internal auditors the opportunity to discuss their findings without management being present, and institutions should establish procedures for employees to submit concerns (confidentially and anonymously) about questionable accounting, control, or auditing matters.

Contingency Planning - Whether using an in-house audit staff or an outsourced arrangement, the institution should have a contingency plan to mitigate any significant discontinuity in internal audit coverage, particularly for high-risk areas.

Outsourcing Internal Audits

Outsourcing arrangements involve contracts between an institution and a vendor that provides internal audit services. The arrangements may involve vendors providing limited or extensive audit assistance. Regardless of the level of outsourced services, an institution's directors are responsible for establishing and maintaining effective internal controls and internal audit programs.

Financial institutions should consider current and anticipated business risks when establishing each party's internal audit responsibilities. Institutions should have a written contract/engagement letter that clearly distinguishes its duties and those of the outsourcing vendor. Such contracts typically include provisions that:

- Define the expectations and responsibilities of both parties;
- Set the scope, frequency, and fees of a vendor's work;
- Describe the responsibilities for providing and receiving information and reports about the contract work status;
- Establish a process for changing contract terms, such as expanding audit work if issues are found;
- State that internal audit reports are the institution's property, designated employees will have reasonable and timely access to the vendor-prepared workpapers, and the institution will receive workpaper copies if needed;
- Specify the locations of internal audit reports and related workpapers;
- Specify the period vendors must maintain the workpapers;
- State that vendor audits are subject to regulatory review and examiners will be granted full and timely access to the internal audit reports and related workpapers;
- Prescribe a process for resolving disputes and for determining who incurs the cost of consequential damages arising from errors, omissions, and negligence;
- State that the vendor will not perform management functions, make management decisions, or act or appear to act in a capacity equivalent to that of a member of management or an employee; and
- State, as applicable, that the vendor will comply with independence guidance established by the American Institute of Certified Public Accountants (AICPA), U.S. Securities and Exchange Commission (SEC), Public Company Accounting Oversight Board (PCAOB), or regulatory agencies.

Management should exercise appropriate due diligence in selecting vendors and periodically review outsourcing arrangements and vendor performance thereafter.

Communication among the internal audit staff, the audit committee, and senior management should not diminish because the institution engages an outside vendor. All work should be well documented, and any identified control weaknesses should be promptly reported to the institution's manager of internal audit. Decisions not to report findings to directors or senior management should be the mutual decision of the internal audit manager and the outsourcing vendor. In deciding what issues should be brought to the board's attention, the concept of *materiality*, as the term is used in financial statement audits, is generally not a good indicator of which control weakness to report. For example, when evaluating an institution's compliance with laws and regulations, any exception may be important.

Accountant Independence

Accounting firms risk compromising their independence if they perform internal and external audit functions at the same financial institution. The Sarbanes-Oxley Act of 2002 prohibits accounting firms from performing external audits of a public company during the same period they provide internal audit services. Non-publicly traded institutions that engage a firm to perform internal and external audit work in the same period are encouraged to consider the risks associated with compromised independence versus potential cost savings.

External Audit

Financial institutions should design external audit programs to ensure financial statements are prepared in accordance with Generally Accepted Accounting Practices (GAAP) and to alert management of any significant deficiencies in internal controls over financial reporting.

Section 36 of the FDI Act, as implemented by Part 363 of the FDIC Rules and Regulations, establishes annual independent audit and reporting requirements for insured depository institutions with total assets of $500 million or more. The 1999 Interagency Policy Statement on External Auditing Programs of Banks and Savings Associations (1999 Policy Statement) includes audit and reporting guidance directed at banks and savings associations with less than $500 million in total assets.

Examiners that identify weaknesses in external auditing programs should include appropriate comments and recommendations in the ROE.

Audit Committees

All banks are strongly encouraged to establish an audit committee consisting entirely of outside directors. Although it may be difficult to establish a committee that includes only outside directors in a small closely held bank, all banks should be encouraged to include outside directors on their board and appoint them to the audit committee.

At least annually, the audit committee or board should analyze the extent of external auditing coverage needed by the bank. The board or audit committee should consider the size of the institution and the nature, scope, and complexity of its operations when evaluating external auditing needs. Institutions should also consider the benefits of:

- Financial statement audits,
- Internal control reviews,
- Additional auditing procedures for specific periods, and
- Additional auditing procedures for high-risk areas or special concerns.

Decisions regarding these considerations and the reasoning supporting the decisions should be recorded in committee or board minutes. If examiners determine risks are present that require additional external auditing, they should make specific recommendations to address the issues.

External Audits of Financial Statements

External audits help boards meet their fiduciary responsibilities and provide greater assurance that financial reports are accurate and complete. The audits can benefit management by providing insight into the effectiveness of accounting and operating policies, internal controls, internal auditing programs, and management information systems.

Each bank is strongly encouraged to adopt an external audit program that includes annual audits of its financial statements by an independent public accountant (unless its financial statements are included in the audit of the parent company's consolidated financial statements). A bank that does so would generally be considered to have satisfied the objectives of the 1999 Policy Statement.

External Audit Reports

Each state nonmember bank that undergoes external auditing work, regardless of the scope, should furnish a copy of any reports by the public accountant or other external auditor, including any management letters, to the appropriate FDIC regional office, promptly after receipt. A bank whose external auditing program combines state-mandated requirements, such as completion of annual directors' audits, with additional procedures may submit a copy of the auditors' report on its state-mandated procedures that is supplemented by a report on the additional procedures. In addition, the FDIC requests each bank to notify the appropriate regional office promptly when any public accountant or other external auditor is initially engaged to perform external audit procedures and when a change in its accountant or auditor occurs.

If a bank chooses an alternative external auditing program, rather than an annual audit of the financial statements, the report produced under the alternative program should include a description of the procedures performed. For example, if the auditor's report states *procedures agreed upon with management* have been performed, the bank should be asked to supply a copy of the engagement letter or other documents that outline the agreed-upon procedures so the FDIC can determine the adequacy of the scope of the external auditing program.

Audits at Institutions Under $500 Million

Regulatory agencies consider an annual audit of an institution's financial statements performed by an independent public accountant to be the preferred type of external auditing program. However, institutions of less than $500 million (at the beginning of their fiscal year) may be able to use alternative methods (some of which may be required by individual state statutes) that include:

- *Reporting by an Independent Public Accountant on an Institution's Internal Control Structure Over Financial Reporting* - This is an independent public accountant's examination and report on management's assertion of the effectiveness of the institution's internal control over financial reporting. For a smaller institution with less complex operations, this type of engagement is often less costly than a financial statement or balance sheet audit. It should include recommendations for improving internal controls, including suggestions for compensating controls, to mitigate risks due to staffing and resource limitations. Management's assertion and the accountant's attestation should generally cover lending and investing as these activities usually present the most significant risks affecting an institution's financial reporting.

- *Balance Sheet Audit Performed by an Independent Public Accountant* - This audit involves an institution that engages an independent public accountant to examine and report only on the balance sheet. As with the financial statement audit, the balance sheet audit is performed in accordance with Generally Accepted Auditing Standards (GAAS). The cost of a balance sheet audit is often less than a financial statement audit. However, under this type of program, the accountant does not examine or report on the fairness of the presentation of the institution's income statement, statement of changes in equity capital, or statement of cash flows.

- *Agreed Upon Procedures for State Required Examinations* - Some state statutes require state-chartered depository institutions to have specific procedures performed annually by their directors or independent persons. Depending upon the engagement's scope, the cost of the agreed-upon procedures or a state required examination might be less than the cost of an audit. However, under this type of program, the independent auditor does not report on the fairness of the institution's financial statements or attest to the effectiveness of the internal control structure over financial reporting. Findings or results are usually presented to the board or the audit committee so they may draw conclusions about the quality of financial reporting or sufficiency of internal control. When choosing this type of external auditing program, the board or audit committee is responsible for determining whether the procedures meet the external auditing needs of the institution, considering the institution's size and the nature, scope, and complexity of its business activities.

If the audit committee or board, at institutions with less than $500 million in total assets, determines not to engage an independent public accountant to conduct an annual audit of the financial statements, the reason(s) to use an acceptable alternative or to have no external auditing program should be documented in meeting minutes. Examiners should determine whether the alternative audit selected is appropriate, adequately covers all high-risk areas, and is performed by a qualified independent auditor. Any identified weaknesses in the external audit program should be commented on in the ROE.

If a bank with less than $500 million in total assets chooses not to have an external audit of financial statements by an independent public accountant, examiners should, at a minimum, strongly encourage the bank to engage an independent auditor to perform an external audit. If high-risk areas are evident, examiners should recommend that the auditor review the areas, and that any other deficiencies in the auditing program be corrected, to ensure there is adequate coverage of operational risk areas.

If a bank with less than $500 million in total assets has no external auditing program, examiners should review the board minutes to determine the board's rationale. Strong internal audit programs are fundamental to the safety and soundness of a bank, but are usually an insufficient reason for not implementing an external auditing program. One program should complement the other. Typically the external audit program tests and validates (or invalidates) the strength of internal controls and the internal audit program. In such situations, examiners should discuss the benefits of external auditing programs with the board and recommend the bank reconsider its decision.

Audits at Institutions of $500 Million or More

All depository institutions should implement adequate audit programs. Institutions with total assets of $500 million or more are required to have external audit programs that conform to the audit and reporting requirements of Part 363 of the FDIC Rules and Regulations.

Institutions covered by Part 363 must:

- Prepare annual financial statements,
- Produce annual reports detailing management's responsibilities and assessing management's compliance with laws and regulations, and
- Provide appropriate report signatures.

Annual financial statements must be prepared in accordance with GAAP and audited by an independent public accountant.

Annual reports must contain a statement of management's responsibilities for:

- Preparing financial statements,
- Maintaining adequate internal controls and procedures for financial reporting, and
- Complying with safety and soundness laws and regulations.

Management's assessment of their institution's compliance with laws and regulations must state a conclusion as to whether the institution complied with applicable laws and regulations, and disclose any instances of noncompliance.

Management reports at institutions with $1 billion or more in consolidated assets must also provide an assessment of the effectiveness of the institution's internal control system and include statements that:

- Identify the internal control framework used to evaluate the effectiveness of controls,
- Indicate controls were considered during the assessment,
- Express management's conclusion as to whether the institution's internal control over financial reporting is effective as of the end of the fiscal year, and
- Disclose any material weaknesses in internal controls that were not remediated prior to the fiscal year-end.

The signature requirements for management reports are related to the type of financial statements used to meet annual reporting requirements. For example:

- If financial statements and management reports are prepared at the institution level, the management report must be signed by the chief executive officer and the chief accounting officer or chief financial officer of the institution.
- If financial statements are prepared at the holding company level and the management report is prepared at the holding company level, the management report must be signed by the chief executive officer and the chief accounting officer or chief financial officer of the holding company.
- If financial statements are prepared at the holding company level and the management report is prepared at the institution level (or if parts of the management report are prepared at the holding company level and other parts at the institution level), the management report must be signed by the chief executive officer and the chief accounting officer or chief financial officer of both the holding company and the institution. Note: The management report must clearly indicate the level (institution or holding company) at which each of its components is being satisfied.

Public Accountant Responsibilities

The independent public accountant engaged by the institution is responsible for:

- Auditing and reporting on the institution's annual financial statements in accordance with GAAS or PCAOB standards; and
- Examining, attesting to, and reporting separately on the assertions of management concerning the institution's internal control structure and procedures for financial reporting on institutions with total assets of $1 billion or more.

Reporting Requirements

Part 363 requires insured depository institutions to submit the following reports and notifications to the FDIC, the appropriate federal banking agency, and the appropriate state bank supervisor.

- An annual report must be filed within 90 days after the fiscal year-end for public institutions and 120 days after the fiscal year-end for institutions that are not a public company or a subsidiary of a public company. When required, the annual report must contain audited annual financial statements, the independent public accountant's audit report, management's statements and assessments, and the independent public accountant's attestation concerning the institution's internal control structure and procedures for financial reporting.
- Within 15 days after receipt, the institution must submit any management letter; the audit report and any qualification to the audit report; and any other report, including attestation reports, from the independent public accountant.
- Within 15 days of occurrence, the institution must provide written notice of the engagement of an independent public accountant, the resignation or dismissal of a previously engaged accountant, and the reasons for such an event.
- A written notice of late filing should be filed on or before the filing deadline if an institution is unable to timely file all or any portion of its Part 363 reporting requirements. The late filing notice shall disclose the institution's inability to file on time and the reasons in reasonable detail. It shall also state the date by which the reports will be filed.

In addition, Part 363 requires certain filings from independent public accountants. Prior to commencing any services for an insured depository institution under Part 363, the independent public accountant must have received a peer review or be enrolled in a peer review program that meets acceptable guidelines. Also, accountants must notify the FDIC and the appropriate federal banking supervisor when it ceases to be the accountant for an insured depository institution.

Audit Committee

Each institution subject to Part 363 must establish an independent audit committee of its board of directors. The members of the committee must be outside directors who are independent of management. Their duties include overseeing the internal audit function, selecting the accountant, and reviewing with management and the accountant the audit's scope and conclusions, and the various management assertions and accountant attestations. Part 363 establishes the following additional requirements for audit committees of insured depository institutions with total assets of more than $3 billion: two members of the audit committee must have banking or related financial management expertise; large customers of the institution are excluded from the audit committee; and the audit committee must have access to its own outside counsel.

Holding Company Subsidiaries

Subsidiary institutions of holding companies, regardless of size, may file the audited, consolidated financial statements of the holding company in lieu of separate audited financial statements covering only the institution. Subsidiary institutions with less than $5 billion in total assets may also elect to comply with the other requirements of Part 363 at the holding company level, provided the holding company performs services and functions comparable to those required of the institution. If the holding company performs comparable functions and services, the institution may elect to rely on the holding company's audit committee and may file a management report and accountant's attestations that have been prepared for the holding company. Subsidiary institutions with $5 billion or more in total assets may elect to comply with these other requirements of Part 363 at the holding company level only if the holding company performs services and functions comparable to those required of the institution, and the institution has a composite CAMELS rating of 1 or 2.

The institution's audit committee may be composed of the same persons as the holding company's audit committee only if such persons are outside directors of the holding company and the subsidiary and are independent of both organizations' management.

If the institution being examined is not the lead bank in the holding company, the examiner should confirm that the institution qualified for and invoked the holding company exemption. The examiner should also review the holding company reports to determine if any pertinent information about the institution was disclosed.

Mergers

Institutions subject to Part 363 that cease to exist at fiscal year-end have no responsibility under this rule. If a covered institution no longer exists as a separate entity because it merged into another institution after the fiscal year-end, but before the date its reports must be filed, institutions are not required to file a Part 363 Annual Report for the last fiscal year of its existence. An institution should consult with the Accounting and Securities Disclosure Section in Washington, DC, and its primary federal regulator if other than the FDIC, concerning the statements and reports that would be appropriate to submit under these circumstances.

Review of Compliance with Part 363

When reviewing the audit report, examiners should carefully assess any qualifications in the independent accountant's opinion and any unusual transactions. In reviewing management's report and the accountant's attestation, special attention should be given to any assessment that indicates less than reasonable assurance of effective internal controls over financial reporting, or less than material compliance with designated laws and regulations. Notices referencing a change in accountants should be reviewed for possible *opinion shopping* and any other issues that relate to safety and soundness issues.

The board's annual determination that all members of the audit committee are *independent of the management of the institution* should also be reviewed. For institutions exceeding $3 billion in total assets, the examiner should review board determinations and minutes documenting that at least two members of the audit committee have banking or related financial management expertise and that no member is a large customer of the institution. Appropriate recommendations should be made in the ROE if any determination is deemed unreasonable.

At the first examination of an institution subject to Part 363, examiners should fully discuss any apparent violations with management and the board. Based on their judgment of the situation, examiners should focus discussions on educating officers and directors and making appropriate recommendations about future compliance. The ROE should indicate the status of the institution's implementation efforts if not yet in full compliance with the rule.

Examiners should convey to the regional accountant any concerns regarding an accountant or an accounting firm's auditing, attestation, or accounting policies and procedures that may necessitate evaluating peer reviews. If the regional accountant considers a peer-review workpaper evaluation warranted, the regional accountant will confer with the Accounting and Securities Disclosure Section about conducting the review. This referral does not preclude the regional office from filing a complaint or recommending an enforcement action against the accountant. Peer-review workpaper evaluations are generally appropriate only in unusual or egregious circumstances; therefore, they should be relatively rare.

Examiners should not provide any written representations concerning Part 363 to institutions or their independent outside auditors. Examiners should refer institutions or auditors to regional accountants if they receive such requests.

←

OTHER EXTERNAL AUDIT ISSUES

Communication with External Auditors

The Interagency Policy Statement on Coordination and Communication Between External Auditors and Examiners (1992 Policy Statement), includes guidelines regarding meetings between external auditors and examiners.

The FDIC encourages communication between its examiners and external auditors with the permission of an institution's management. Permission is deemed to have been given once an institution notifies the FDIC of the accountant's name or the accounting firm that it engaged as external auditor (by letter or by submitting a copy of the auditor's report to an FDIC regional office). Permission continues until the institution notifies the FDIC that its relationship with the external auditor was terminated or another auditor was engaged.

The FDIC encourages external auditors to attend exit meetings and other significant discussions at which examiners and management discuss examination findings. In addition, auditors may request a meeting to discuss relevant supervisory matters with any of the regulatory agencies involved in the institution's supervision. An auditor who determines that communication with the FDIC is warranted concerning a recent examination should contact the appropriate regional office. A regional office staff member, examiner, or field supervisor may discuss pertinent examination findings with the external auditor. Regulatory agencies will usually ask management to be represented at the meeting. However, an external auditor may request a meeting without management representation.

Requests for meetings and information can also originate with regulatory agencies. Examiners may request meetings, including confidential meetings, with an institution's external auditor if questions arise concerning matters on which the external auditor is knowledgeable. FDIC personnel should determine if the external auditor discovered any problems relevant to the FDIC. Furthermore, FDIC personnel may request copies of workpapers relating to services performed by the external auditor. In some instances, an FDIC examiner, field supervisor, or regional office staff member may determine that attending the meeting at which the audit report is discussed between an institution's auditors and its management or board of directors (or an appropriate committee) would be useful. The institution should be advised and asked to present the request to the auditor.

The 1992 Policy Statement encourages open communication between examiners and auditors, and suggests institutions should provide its external auditors a copy of certain reports and supervisory documents including: reports of condition, examination reports, regulatory correspondence, and any formal or informal regulatory agreements or actions.

Similarly, AICPA guidance suggests auditors should communicate with examiners. The guidance indicates auditors should consider reviewing communication from examiners, and when appropriate make inquiries of examiners. The AICPA guidance also indicates auditors should be responsive to examiner's requests to attend meetings between auditors and bank management, and that management's refusal to allow auditors to review regulatory material or to communicate with examiners would ordinarily be an audit scope limitation sufficient to prevent the auditor from rendering an opinion.

Workpaper Review Procedures

Examiners, in consultation with the regional accountant, may review external audit workpapers relating to audits of financial institutions or their holding companies. Workpaper reviews may enhance examiners' ability to scope an examination by identifying areas where audit work was sufficient to allow a reduction in examination procedures and by identifying higher-risk areas where examination procedures should be expanded. A workpaper review may be especially useful if an institution has asset quality problems, complex investments, aggressive accounting practices, mortgage servicing activities, or large deferred tax assets.

Before undertaking any workpaper review, examiners should coordinate activities with the state bank supervisor and primary federal regulator (if other than the FDIC) of the institution, its holding company, and any other holding company subsidiaries. No set of workpapers should be reviewed more than once by the agencies.

Examiners should review the workpapers of the independent public accountant or other auditor performing the institution's external auditing program when an FDIC-supervised institution has undergone a financial statement or balance sheet audit, and:

- Significant concerns exist regarding matters that would fall within the scope of the work performed by the institution's external auditors, or
- The institution has been, or is expected to be, assigned a UFIRS composite rating of 4 or 5.

However, when considering how best to use examination resources, examiners should exercise reasonable judgment with respect to performing an external audit workpaper review for these institutions. For example, it would be appropriate to conduct an external audit workpaper review for FDIC-supervised institutions when significant matters exist and the review is reasonably expected to provide an examination benefit. If examiners determine that a benefit would not be derived from performing an external audit workpaper review for an FDIC-supervised institution, examiners must document, and include in the examination workpapers, the reasons for not conducting the review.

Requests by the regional director for access to a public accountant's workpapers should be in writing and specify the institution to be reviewed, indicate the accountant's related policies and procedures should be available for review, and request that a staff member of the public accounting firm knowledgeable about the institution be available to answer questions. Because workpapers are often voluminous, examiners are expected to view them where they are located. Since these workpapers are highly confidential, examiners are encouraged to take notes of needed information and should request copies of only those workpapers necessary for their records. Examiners should not request copies of all workpapers.

Complaints Against Accountants

An examiner encountering possible violations of professional standards by a CPA or licensed public accountant should, if practical (after consulting with the regional office), discuss the matter with the accountant in an attempt to resolve the concern. If the concern is not resolved, the examiner should send a memorandum to the regional director, with a copy to the regional accountant, summarizing the evidence of possible violations of professional standards and the inability to resolve the matter with the accountant. After conferring with the Accounting and Securities Disclosure Section, the regional office may determine it is appropriate to inform the accountant that a complaint to the AICPA and/or state board of accountancy may be considered. Where notification of apparent violation of professional standards appears appropriate, letters should be concurrently forwarded by the regional director to the state board of accountancy in the institution's home state, the Professional Ethics Division of the AICPA (in the case of certified public accountants), the subject accountant or firm, and the RMS Accounting and Securities Disclosure Section.

In addition to violations of professional standards, complaints should also include evidence of substandard auditing work or lack of independence.

Third-Party Audits at FDIC's Request

Examiners sometimes determine an institution is involved in unique activities or complex transactions that are outside management's expertise. For example, the institution may carry certain complex financial instruments or other unusual assets on its financial statements at values management cannot adequately support and the examiner cannot confirm. Additionally, the institution may have certain internal control problems that require the expertise of an independent consultant to resolve properly.

In these situations, after receiving appropriate approval, examiners may request an institution to contract with an independent public accountant or other professional to perform specific work to address the identified concern. Such an assignment would not be included in the normal scope of work performed in external auditing programs. This additional work, when performed by an independent public accountant, may be considered an engagement to perform *agreed-upon procedures*, to issue a *special report*, or *to report on the application of accounting principles* under applicable professional standards. These latter two engagements are performed by an independent public accountant under GAAS or PCAOB standards, while agreed-upon procedures are performed under Generally Accepted Standards for Attestation Engagements (GASAE). If another type of professional is contracted to perform services for an institution, the professional may be subject to a different set of professional standards. Nevertheless, the important elements for the examiner to consider when evaluating the adequacy of the institution's contract with the professional are similar in all cases.

When the FDIC requires an institution to contract an independent public accountant or other outside professional for specific work, the regional office should ask the institution to provide the FDIC with a copy of the contract before it is signed. The regional office should review the contract to determine if it sufficiently describes the work to be performed so that the outside professional can understand the FDIC's expectations and be responsive to any specific work requirements. The contract or engagement letter should, at a minimum, include:

- A description of the work to be performed;
- The responsibilities of the accountant or other professional;

- An identification of any specific financial statement elements, accounts, or items on which the work is to be performed; the party responsible for recording them in the financial statements; and the basis of accounting of the specific elements, accounts, or items on which the work is to be performed;
- A reference to any applicable professional standards covering the work, such as auditing, attestation, and appraisal standards;
- A description of:
  - Any specific procedures to be performed,
  - Any specific information sources to be used,
  - The qualifications of employees who perform the work,
  - The time frame for completing the work,
  - Any restrictions on the use of the reported findings, and
  - A provision for examiner access to workpapers. For example:

    The workpapers for this (specify type of engagement, e.g., agreed-upon procedures, special report) are the property of (name of firm) and constitute confidential information. However, (name of firm) agrees to make the workpapers supporting this engagement available to the FDIC and other federal and state banking regulators. In addition to the workpapers, (name of firm) agrees to make any or all of the following available to the FDIC and other federal and state banking regulators:

    - The work plan or similar planning document relating to this engagement;
    - The process used for the selection of samples used in the specific work, if applicable; and
    - Other pertinent information on the firm's policies and procedures that may affect this work plan.

    Access to the workpapers will be provided at (name of firm) local office under the supervision of our personnel. Furthermore, upon the request of the FDIC or other federal and state banking regulators, we agree to provide photocopies of selected workpapers to them.

SARBANES-OXLEY ACT

The Sarbanes Oxley Act of 2002 (SOX Act) was enacted to protect investors from fraudulent accounting activities by corporations. Protections center on annual financial disclosures and requirements that management and auditors establish internal controls and report on the adequacy of those controls.

The SOX Act is primarily directed toward companies that have a class of securities registered with the Securities and Exchange Commission or a federal banking agency. Applicability of the SOX Act to insured depository institutions depends primarily on an institution's size and whether it is a public company or a subsidiary of a public company.

Public Companies

Some FDIC supervised banks have securities registered pursuant to Part 335 of the FDIC Rules and Regulations and are therefore public companies. Other FDIC supervised banks are subsidiaries of public holding companies. Public companies and their independent public accountants must comply with the SOX Act, including provisions governing audit standards, management responsibilities, and financial disclosures.

Non-public Banks

Non-public banks generally do not fall within the scope of the SOX Act. However, existing regulatory guidance, such as Section 36 of the FDI Act and Part 363 of the FDIC Rules and Regulations, contains audit, internal control, and reporting requirements that mirror portions of the SOX Act. Although such practices are not mandatory for smaller, non-public institutions, the FDIC encourages all institutions to implement accounting, internal control, and reporting practices to the extent possible, given their size, complexity, and risk profile.

Reporting Requirements

Banks with total assets of $500 million or more at the beginning of their fiscal year are subject to the annual audit and reporting requirements of Section 36 of the FDI Act as implemented by Part 363 of the FDIC Rules and Regulations. Under certain circumstances, some institutions may satisfy Part 363 requirements by submitting audited, consolidated financial statements of their holding company. Key reporting requirements applicable to FDIC-supervised banks with $500 million or more in total assets include:

- Preparing annual financial statements in accordance with GAAP that are audited by an independent public accountant; and

- Preparing annual management reports that contain:
  - A statement of management's responsibilities for preparing financial statements, maintaining an adequate internal control structure, and complying with laws and regulations; and
  - An assessment by management of the institution's compliance with such laws and regulations during such fiscal year.

←

EVALUATING AUDIT PROGRAMS

Examiners should evaluate audit and control procedures as part of their overall assessment of a bank's internal control program. Each bank presents unique situations to which common sense and technical knowledge must be applied. Examiners should consider an institution's risk profile, size, complexity, number of employees, etc., when determining the overall adequacy of an internal control program.

Recommendation Considerations

Examiners should inform management and the board if they identify material or numerous internal routine and control deficiencies. When deficiencies are considered to be of sufficient importance, appropriate comments should be included in the ROE. Examiners should make recommendations for corrective actions only after considering the following:

- Recommendations should have merit. Criticisms that could be regarded as petty or highly technical may not help improve the bank's control environment.
- The benefit to the bank of implementing a recommendation should be emphasized.
- Recommendations or criticisms should be discussed fully with management prior to bringing it to the board's attention, as the record or procedure being criticized may be more fully understood by a banker who can offer a persuasive reason for its continuance.
- Examiners should not recommend banks maintain records in a specific format, or obtain software or accounting forms from a particular vendor.
- Convincing management to implement corrective actions is best accomplished by identifying material deficiencies and recommending effective solutions. Discussing minor deficiencies with management and making verbal recommendations (which should be documented in examination workpapers) may result in more effective correction of non-critical deficiencies.
- The relative importance of an individual control or lack thereof must be viewed in the context of other related controls.

Troubled Banks

Examiners should identify banks that have not had audits performed by an independent public accountant and at which any of the following conditions exist:

- Internal controls or internal auditing procedures are inadequate,
- The directorate is generally uninformed in the area of internal controls,
- There is evidence of insider abuse,
- There are known or suspected defalcations,
- There is known or suspected criminal activity,
- It is probable that director liability for losses exists,
- Direct verification is warranted, or
- Questionable transactions with affiliates have occurred.

In these situations, the examiner and regional office staff should consider adding a provision to any contemplated administrative order that the bank obtain an audit or, if more appropriate, have an independent public accountant or other qualified independent party perform specified audit procedures. Because each situation is unique, the examiner and regional office must evaluate the type of external audit program most suitable for each troubled bank and, in conjunction with regional counsel, ascertain that the inclusion of such an external audit program as a condition in an order is appropriate. Whenever a condition requiring an audit or specified audit procedures is included in an order, it should include requirements that the bank promptly submit copies of the auditor's reports to the regional office and notify the regional office in advance of any meeting between the bank and its auditors at which audit findings are to be presented.

Management Responsibilities

Assessing internal control programs is a critical part of examinations. In most cases, examiners can assess the adequacy of a bank's internal controls by reviewing:

- The overall structure of audit and control programs, monitoring procedures, and reporting mechanisms;
- Various audit reports in conjunction with the completion of standard examination procedures; and
- A limited number of specific controls or audit procedures.

Examiners should focus on identifying and correcting systemic weaknesses when evaluating internal control programs. Serious program weaknesses may exist if management fails to:

- Delineate clear lines of authority and responsibility,

- Standardize risk assessment procedures,
- Segregate operating and recording functions,
- Provide adequate and qualified audit personnel, or
- Regularly review and respond to audit reports.

In some instances, internal controls, monitoring procedures, reporting mechanisms, or financial conditions may indicate that more extensive audit tests should be undertaken. Testing procedures that may help identify errors, fraud, or insider abuse are discussed in the Examination Techniques section below. Examiners should refer to the Bank Fraud and Insider Abuse section of this Manual if they identify material errors or irregularities.

Common Controls

The following functions and related audit procedures should be included in most audit programs. The list is not all-inclusive and deficiencies in any one area may not represent an overall inadequate control program.

Cash and Due From Audits

The primary objectives of cash and due from audits are to ensure account balances are properly recorded, cash items clear within a reasonable period, and due-from accounts are substantiated and tested.

Auditors should periodically verify cash on hand, cash items, overdrafts, and other assets or liabilities held in suspense to ensure items are properly controlled, recorded, and disposed.

Due from reconciliations should be reviewed each month by someone who does not regularly reconcile the accounts. Particular emphasis should be placed on reviewing old or recurring items. Auditors should obtain account statements from depository institutions as of the audit date, and subsequent to the audit date, for validating bank reconcilements and ensuring outstanding items are cleared. Auditors should review all return items for an appropriate period after the audit date.

Investments

The primary objectives of investment audits are to ensure:

- Physical security certificates are on hand or held in safekeeping by others;
- Book entries are properly recorded;
- Interest and dividend income and security gains or losses are properly recorded;
- Securities are properly recorded as held-to-maturity, trading, or available-for-sale;
- Personnel follow segregation-of-duty and joint-custody directives, and
- Temporary declines in value are identified.

Auditors should:

- Prove subsidiary records to the general ledger,
- Verify securities on hand or held by others for safekeeping,
- Check the gain and loss entries on securities sold or matured since the previous audit,
- Review accrued interest accounts and substantiate computations and dispositions of interest income, and
- Assess premium-amortization and discount-accretion calculations.

Loans

Auditors should periodically:

- Prove subsidiary records to the general ledger,
- Verify a sampling of loan balances on a positive or negative basis,
- Verify the existence of negotiable collateral,
- Review accrued interest accounts and confirm the computation and disposition of interest income,
- Verify leases and related balance sheet accounts,
- Test unearned discount accounts, and
- Check rebate amounts for prepaid loans.

Allowance for Loan and Lease Losses (ALLL)

Auditors should:

- Review the balance of loans with charge-offs and the debit entries to the ALLL account,
- Review the balance of loans with recoveries and the credit entries in the ALLL account,
- Check supporting documentation for loans charged off, and
- Determine compliance with GAAP regarding the ALLL methodology used to estimate credit losses on individually and collectively evaluated loans.

Bank Premises and Equipment

Auditors should:

- Review entries and documentation relative to purchases and sales of premises and equipment since the previous audit;
- Verify computations of depreciation, amortization, and impairment;
- Check computations of gains or losses on property sold; and

- Trace sale proceeds.

Other Assets and Other Liabilities

Auditors should ascertain the appropriateness of other-asset and other-liability accounts by reviewing related policies, procedures, and internal controls and ensuring transactions are properly authorized, recorded, and balanced.

Deposits

Auditors should:

- Reconcile subsidiary records to general ledger accounts,
- Verify account balances on a test basis,
- Review closed accounts and determine if the accounts were properly closed,
- Review activity in dormant accounts and insider accounts,
- Review overdrafts,
- Check the computation of service charges and trace postings to appropriate income accounts,
- Review accrued interest accounts and check the computation of interest expenses,
- Verify the numerical sequence of pre-numbered certificates of deposit and official checks,
- Reconcile and determine the validity of outstanding official checks,
- Examine documentation supporting paid official checks, and
- Test certified checks to customers' collected funds.

Borrowed Funds

Auditors should:

- Confirm borrowings were authorized in accordance with internal policies,
- Verify balances of borrowed funds,
- Ensure collateral for borrowings is properly identified and disclosed,
- Verify changes in capital notes outstanding, and
- Review related accrued interest computations and interest expense balances.

Capital Accounts and Dividends

Auditors should account for all unissued stock certificates, review capital account changes since the previous audit, check computations for dividends paid or accrued, and review board minutes to determine the propriety of dividend payments and accruals.

Other Control Accounts

Auditors should test rental income for safe deposit boxes, examine and confirm safekeeping items, and reconcile consigned items on hand.

Income and Expenses

Auditors should test income and expenses by examining supporting documentation for authenticity and proper approval, and should test accruals by either re-computing amounts or examining documents supporting such accruals.

Direct Verification

Direct verification is an effective method of confirming the accuracy and validity of certain accounts, particularly loan and deposit accounts. Direct verification should be an important part of all internal and/or external audit programs, and may be employed as an internal control separate from regularly scheduled audits.

There are two primary types of direct verification, positive and negative. When the positive method is used, the customer is asked to confirm whether the balance, as shown, is correct. When the negative method is used, a reply is not requested unless an exception is noted.

The positive method has advantages from an audit standpoint as it provides considerable assurance the customer has carefully checked the confirmation form. The negative method is less costly and provides a measure of protection in those institutions having a strong program of internal control. The positive method is recommended for loan accounts. The positive method is preferred for deposit accounts, but because of high volume and cost factors, the negative method is often employed.

It is suggested that at a minimum, large deposit accounts, public fund accounts, dormant accounts, and accounts with unusual or high volumes of activity be positively verified. Additionally, overdue loans and charged-off loans should be confirmed through positive verification.

Direct verification may be conducted for all customers within a specific account type or through an appropriate sample. The necessity for a complete verification of loans or deposits is rare. A partial verification of representative accounts is usually satisfactory.

Direct verification may be performed by bank staff or contracted to a third party. To be effective, the verification procedure (including follow-ups) must be completely controlled by someone that does not have responsibility for the accounts or records being verified.

←

FRAUD AND INSIDER ABUSE

Introduction

Financial institutions are highly susceptible to fraud, embezzlements, and theft; and bank personnel at every level have opportunities to commit dishonest acts. Uncovering fraud is not the primary reason examinations are conducted; however, examiners must be able to recognize fraudulent or abusive actions.

The following items include higher-risk accounts and common methods for manipulating financial records.

Loans

Forged or fictitious notes; accommodation loans; loans to insider-related shell companies; embezzlement of principal and interest payments; failure to cancel paid notes; use of blank, signed notes; embezzlement of escrow and collection accounts; commissions and kickbacks on loans; fraudulent loans to cover cash items and overdrafts; and diverted recoveries of charged-off loans.

Loan Collateral

Loans secured by fraudulent collateral such as altered, stolen, or counterfeit securities; certificates of deposit issued by illegitimate offshore banks; and brokered loans and link-financing arrangements where underlying collateral is not properly pledged or is prematurely released.

Deposits

Unauthorized withdrawals from dormant accounts; fictitious charges to customer accounts; unauthorized overdrafts; payment of bank-personnel checks against customer accounts or fictitious accounts; manipulation of items used to reconcile deposit trial balances; unauthorized withdrawals from accounts where the employee is acting as an agent or in some other fiduciary capacity; withholding and destroying deposit tickets and checks; misappropriation of service charges; check kiting; and manipulation of certificates of deposit, money orders, and official checks.

Correspondent Bank Accounts

Concealing a shortage by unreasonably delaying the recording of cash letters; delayed remittance of cash letters; fictitious credits and debits; manipulations to prevent the detection of overstated balances, such as issuing drafts without corresponding recordation on the bank's books or credit to the account; overstatement of cash letters and return items; and false collection items.

Tellers and Cash

Lapping deposits (covering one day's shortage with the next day's receipts); theft of cash; excessive over and short activity; fraudulent checks drawn on customers' accounts; fictitious cash items; manipulation of cash items; and intentional failure to report large currency transactions or suspicious activity.

Income and Expense

Embezzlement of income; fraudulent rebates on loan interest; fictitious expense charges; overstated expenses; and misapplication of credit life insurance premiums.

Investment Securities

Collusion between a bank employee and a securities dealer to trade securities at inflated prices; concealing trading losses from bank management and examiners; and unauthorized purchases and sales of securities, futures, or forward contracts with benefits accruing to a bank employee. Improper securities trading practices include:

- Placing personal trades through bank accounts, thereby obtaining the advantage of the bank's volume discounts on commissions;
- Purchasing or selling an issue of securities prior to executing bank or trust account trades, which could be expected to change the price of the security thereby providing a personal price advantage (front-running);
- Purchasing and selling the same securities on the same day with the trader retaining the gains from any price increase, but assigning losses to trust accounts if prices decrease; and
- Buying or selling based on nonpublic, inside information, which might affect the price of securities thereby enabling the trader to benefit personally from the transaction.

Additional Risks

Numerous methods are used to defraud banks and pose an ongoing problem. While no bank is exempt from the threat of defalcations by management, employees, or outsiders, certain institutions are more vulnerable than others. Any of the following situations may indicate the need to use more comprehensive audit techniques:

- An institution has one officer with dominant control over a bank's operations.
- Audit programs are inadequate.

- Internal control deficiencies are evident, such as weak vacation policies or ineffective segregation of duties.
- Records are poorly maintained or carelessly handled.
- Close supervision by the board of directors or senior management is inadequate, especially where rapid growth has occurred or numerous inexperienced managers are employed.
- A bank has grown substantially in a short time period. (The growth may have involved the use of high deposit rates, brokered funds, fraudulent or poor quality loans, or dishonest acts to conceal the bank's true condition.)
- A bank has had limited growth or a steady decline in deposits despite general economic prosperity in their operating area or strong growth by competing institutions.
- Earnings and yields are below average and expenses are high in comparison with past operating periods with no apparent explanation for the change.
- The bank is experiencing abnormal fluctuations in individual revenue or expense accounts, either in terms of dollar amounts or in relation to other operating accounts.

←

EXAMINATION TECHNIQUES

Introduction

Numerous methods for concealing fraud exist, and even comprehensive audit techniques may not expose deceptive practices. However, when necessary, examiners should conduct detailed audit procedures. The audit techniques described below are not intended to be used at every examination; however, examiners should consider using these or similar techniques when appropriate.

Examiners should consult with the regional office if fraud-related examination procedures appear warranted.

Account Reconcilements

Examiner-prepared reconcilements of asset, liability, and capital accounts help ensure entries are properly recorded and subsidiary account records balance to the general ledger.

Direct Verification

Direct verifications are rarely initiated by regulatory personnel. Typically, financial institutions perform the verifications as part of their comprehensive audit function. If examiners, in consultation with regional office personnel, determine direct verifications are necessary, it is preferred that the bank or its external auditors make the customer contacts as these parties can more efficiently verify transactions with bank customers.

However, in certain situations it may be necessary for the FDIC or another banking agency to perform direct verifications. This may be appropriate if significant unreconciled items are disclosed, or evidence of potential fraud exists. Regional director approval must be obtained before examiners initiate direct verification of bank accounts or transactions. The following basic procedures or guidelines should be used if direct verifications are performed by FDIC staff.

- Addressing, stuffing, sealing, and mailing of envelopes should be done by examination personnel only.
- Franked envelopes furnished for reply should be preaddressed to the field office, regional office, or a post office box rented for the purpose.
- Duplicate records of all items verified should be maintained for control purposes.
- Examiners should watch for borrowers with common addresses or post office box numbers and for accounts having the same addresses as bank officers and employees.
- Loan verifications should include charged-off notes; separate notices should be sent to primary obligors, co-makers, endorsers, and guarantors.
- Third-party guarantees on lines of credit or individual notes should be verified directly with guarantors, not through primary obligors.
- Deposit verifications should be considered for recently closed dormant accounts, overdrawn accounts, and pledged accounts.
- All replies should be compared against retained duplicate records. Exceptions should be fully investigated against bank records or through follow-up correspondence with customers.
- Undelivered and returned tracers, unacknowledged verifications, and unexplained differences should be discussed with the entire board, not just with officers.

Loans

Examiners should consider using the techniques discussed below during loan reviews, especially if credit administration is weak or if they identify potential irregularities.

- Compare the signature on a note with other notes or documents signed by the maker.
- Review bank records to determine who actually pays the interest and principal (and the source of the funds) on large lines of continuous credit.

- Review records for power-of-attorney agreements giving an individual other than the named borrower(s) control of loan proceeds. (The agreements may be a sign of straw/nominee loans.)
- Review records for any changes to the official signers on deposit accounts established to receive loan proceeds. This may allow individuals other than the named borrower(s) to control loan proceeds.
- Investigate weak credit lines where directors or management may be the interested party although the bank's records do not reflect their interests.
- Spot check a cross section of out-of-territory loans to verify the disbursement of loan proceeds and the source of principal and interest payments.
- Audit the interest collected on a sampling of loans. Review the loan interest account for several days and compare the total with journal figures and the amount credited to the general ledger.
- Compare collateral records to loans secured by such collateral, and compare the collateral receipt date with the date the loan was granted.
- Review charge-offs in banks with large or numerous charge-offs. Verify the amount charged off was the approved amount; determine who prepares the list of charge-offs, who collects recoveries, and the accuracy of the reporting of these items. Compare actual loan documents with the bank's records to confirm balances and signatures.
- Consider tracing the proceeds of large loans and lines of credit that are subsequently charged off. (Tracing loan proceeds involves following the trail of funds from initial and subsequent loan disbursements to determine the person or entity that ultimately received the funds and how the funds were used. Disbursements may be transmitted by cash, check, wire transfer, other electronic means, or a credit to deposit/loan accounts at the bank.) When large loans are funded or material loan losses incurred, it may be advisable to analyze credits by tracing disbursement of loan proceeds and reviewing the borrower's deposit account(s) for possible payments of commissions or fees to a bank officer.
- Consider the following when reviewing the recordkeeping and monitoring of principal and interest receipts, especially payments relating to revolving accounts-receivable (A/R) financing:
  - Review records for occurrences of lapping payments. (Lapping occurs when an employee misappropriates funds (such as a loan payment), and covers the theft with payments from another loan customer or from advance (early) payments from the same customer.)
  - Review records for occurrences of payments made through the creation of fraudulent notes or unauthorized use of dealer reserve accounts.
  - Check records for an unusually large number of advance payments or overdue loans. In suspect cases, trace a sample of transfers to and from borrowers' checking accounts.
  - Spot check a cross-section of loans for appropriate signatures, disposition of proceeds, collateral, and sources of payment (particularly if outstanding loan volumes increased substantially between examinations for no apparent reason and overdue loans are unusually low or high).
  - Review records for occurrences of loan payments that come from the proceeds of other loans. Be watchful for multiple payments made on the same date for a particular note or borrower and compare the total of the payments with new loans granted on or about the same date.
  - Spot check for adequate recordkeeping if indirect dealer-paper lines are poorly monitored.

Deposits

Risks associated with inappropriate deposit account transfers are elevated in banks with weak internal controls and audit programs. Consider the following items when investigating potentially improper activities relating to deposit accounts.

- Reconcile subsidiary and general ledger accounts and any related adjustment items such as return items, overdrafts, holdovers, or service charges.
- Review any unusual or unapproved withdrawals from inactive or dormant accounts.
- Compare cash items, rejects, and exception items to individual account records to determine if the accounts exist, have sufficient funds, or have been closed.
- Cross check the interest paid on certificates of deposit to the interest expense account to verify ownership, dates, amounts due, and amounts actually paid.
- Be alert for possible check kiting when reviewing accounts. When available, review reports on kiting suspects and uncollected funds. Kiting characteristics include a high number of daily deposits, a high percentage of deposits coming from accounts under common control of a kiting suspect, large round-dollar checks, total daily debits and credits of similar amounts, and small average balances.
- With a bank employee, reconcile incoming cash letters and local clearings, and sight-post items to demand account records to determine if there is an account for each item. If the cash letter has already been opened, compare the number of items listed on the tape accompanying the letter with actual items to ascertain whether any items have been removed.

Correspondent Bank Accounts

The following audit steps can be used when evaluating correspondent accounts:

- Reconcile subsidiary and general ledger accounts, and compare a sample of paid and cancelled drafts drawn on correspondent banks to ledger entries for the same days. Select appropriate test periods, such as the date, and for several subsequent days after, material business activities occurred or the date institutions were notified of upcoming examinations.
- Review prior internal reconcilements of cash due from correspondents and statements received from correspondents. Ensure the reconcilements identify large outstanding items, unusual activity, forced balancing, and unreasonable or ongoing delays in crediting correspondents for their charges. (Delays in remitting for cash letters can be used to cover defalcations.) Also, ensure irregular items are properly reported.
- Review entries of similar amounts and dates between correspondent accounts that may indicate possible kiting or shortages between correspondent accounts.
- Compare coin and currency transactions reflected on correspondent accounts to the bank's increase or decrease in the cash account on corresponding days.

Tellers and Cash

When warranted, tellers' daily cash records can be inspected for possible discrepancies such as mathematical errors, forced balancing, unusual charges or adjustments, and excessive total balances or number of cash items. Items drawn on or by bank personnel should always be verified as to final payment or disposition. All work can be checked for proper endorsements and dates that indicate a teller is carrying items for an excessive period.

Suspense Accounts

Suspense accounts are sometimes used to conceal shortages, worthless assets, and deposit diversions. Review suspense accounts for material, stale, or unusual items, especially noting the recurring use and aging of reconciling items.

Income and Expense Accounts

Examiners can test interest computations on a sample of loans and securities. Verify large, recurring, or unusual debits to income accounts, and test interest rebates on loans and monthly service charges on demand deposits. Finally, compare interest paid on time and savings deposits to the amount credited to respective control accounts.

General Ledger Accounts

Determine the reason for any unusual activity in general ledger accounts, or abnormal variations between various general ledger accounts, and assess the validity of any reversing or correcting entries. Select appropriate test periods, such as the date, and for several subsequent days after, material business activities occurred or the date institutions were notified of upcoming examinations. Trace all closing income entries to the undivided profits account.

Other

Be alert for any major changes, particularly growth, in asset or liability totals. In cases of rapid loan expansion, check for possible out-of-territory loans to insiders. Also, if loans and certificates of deposit have increased beyond normal expectations, check the source of certificates of deposit; check for tie-ins between new notes and new certificates of deposit as to common names, amounts, and dates; trace the proceeds and determine the source of principal and interest payments on potentially inappropriate new loans.

Secretary of State Websites

Many states have websites examiners can use to obtain useful information on an entity's corporate structure, principal shareholders, or officers and directors. The websites may also contain information on the principals' other business relationships.

←

RELATED CONTROL ISSUES

Information Technology

Part 364 of the FDIC Rules and Regulations requires financial institutions to have internal controls and information systems commensurate with the size of their institution and the nature, scope, and risk of their activities. Appendix B of Part 364 requires banks to have information security programs that include administrative, technical, and physical safeguards. Program standards should be designed to:

- Ensure the security and confidentiality of customer information;
- Protect against anticipated threats to the security or integrity of such information;
- Protect against unauthorized access to, or use of, information that could result in substantial harm or inconvenience to any customer; and
- Ensure the proper disposal of consumer information.

A bank's board of directors, or an appropriate board committee, should:

- Approve a written information security program;
- Oversee the development, implementation, and maintenance of the program;
- Assign specific responsibility for implementing the program; and
- Review reports from management.

Information systems present a variety of risks that, if not adequately managed, can negatively affect the safety and soundness of the institution. Therefore, examiners should assess information technology controls and operations at every examination. If an institution's internal control systems do not meet the program standards described above, the deficiencies should be described in the ROE.

Institutions should maintain a comprehensive security plan in order to maintain the confidentiality, integrity, and reliability of information. The plan should include regular risk assessments and, at a minimum, address physical and logical security, and backup and contingency strategies.

Generally, IT risk assessments consist of the identification of hardware, software, and information; an analysis of internal and external threats to the assets; and an evaluation of existing controls. The findings can provide management valuable information regarding the security of IT assets and any controls that may need strengthening. Management should use the information to develop strategies for improving identified control weaknesses and mitigating identified risks.

The FFIEC IT Examination Handbook, which comprises a series of booklets, serves as a reference for managing and examining IT systems. The Handbook contains IT examination procedures, workprograms, and references to related laws, regulations, and examination policies. It also provides examiners with fundamental principles of internal controls applicable to information processing environments. The FFIEC procedures and workprograms are the primary tools for the examination of large, complex data centers in financial institutions and independent technology service providers.

Examiners can also use portions of the FFIEC procedures and workprograms when necessary to review complex or high-risk areas during IT reviews of less complex, well-managed institutions.

Management Information Systems

The term *management information system* (MIS) broadly refers to a comprehensive process, supported by computer-based systems, that provides the information necessary to manage an organization. An effective MIS is essential in all institutions, but becomes increasingly important for managing risks in larger institutions with diverse business lines or a wide geographic footprint. Essential components of an effective MIS include timeliness, accuracy, completeness, consistency, and relevance. Management decisions may be invalid if any one of these components is compromised.

To evaluate an MIS, and ultimately the foundation upon which management's decisions are based, examiners should scrutinize each of the essential components. First, information must be current and available in a useful format to all appropriate users. This necessitates the prompt collection and editing of data. Second, an effective system of internal controls must be in place to ensure information is accurate and complete. Third, strategies and decisions cannot be adequately monitored or measured unless the information provided is consistent. Variations in how data is collected or reported can distort its usefulness, particularly in trend analyses. Any change in information collection or reporting procedures should be clearly defined, documented, and communicated to all users. Finally, the information provided must be relevant to the user. Reports that are overly complex or include unnecessary information impede users' ability to make effective decisions. Conversely, reviewing information from numerous reports can hinder analysis; therefore, a key consideration in the adequacy of reports is that they present information in a comprehensive, yet concise format.

Payment Systems

Financial institutions process a variety of payment instruments using various clearing and settlement systems. The systems are generally differentiated as wholesale or retail systems.

Although there is no definitive division between retail and wholesale payments, retail payment systems generally involve transactions between two consumers or between consumers and businesses and have higher transaction volumes and lower average dollar values.

Key risks in payment and settlement systems include:

- Credit Risk - The possibility a counterparty will not settle an obligation for full value either when due, or anytime thereafter.
- Liquidity Risk - The possibility a counterparty will not settle an obligation for full value when due.
- Operational Risk - The possibility of loss resulting from external events or inadequate internal processes,

people, or systems. This type of risk includes physical and logical security threats.
- Legal Risk - The possibility of loss because of the unexpected application of a law or regulation, or because a contract cannot be enforced.

Risk profiles vary significantly based on the size and complexity of an institution's payment-system products and services, IT infrastructure, and dependence on third parties. All financial institutions should maintain an effective internal control environment commensurate with the level of payment products and services offered. Detailed procedures for reviewing retail and wholesale payment systems are covered in the FFIEC IT Examination Handbooks.

Lost and Stolen Securities Program

The SEC started the Lost and Stolen Securities Program in 1977 to reduce trafficking in lost, stolen, missing, and counterfeit security certificates. Security certificates are documents representing, or claiming to represent, ownership in a security.

A security may be certificated or uncertificated. Ownership of a certificated security is represented by a security certificate. Ownership of an uncertificated security is not represented by a physical document, but simply by registration on financial records (book entries). The vast majority of securities are held in book entry form with a custodian.

Banks may acquire certificated securities when investing, holding securities as trust assets or collateral for loans, or through transfer agent activities. In each situation, a bank might acquire a security certificate that was reported as lost, stolen, counterfeit, missing, or otherwise encumbered.

The SEC implemented Rule 17f-1 to govern the reporting and recordkeeping of securities as a means for reducing trafficking in lost, stolen, missing, and counterfeit securities. The Securities Information Center (SIC) operates the SEC's Lost and Stolen Securities Program. The SIC may be contacted at the Securities Information Center, Inc., P.O. Box 55151, Boston, MA 02205-5151 or at www.secic.com.

Registration

All registered FINRA[1] broker dealers, FDIC-insured banks, and transfer agents that handle physical certificates must be registered with the SIC in order to report securities to the SIC database, or make database inquiries. Banks that did not handle certificated securities within the last six months do not need to be registered.

Registration can be direct or indirect. Banks registered as direct inquirers are allowed to make inquiries against the SIC database. Banks registered as indirect inquirers must have an agreement with a direct inquirer who makes inquiries on their behalf. In either event, institutions may inquire of the SIC whether a certificate has been reported as lost, stolen, counterfeit, missing, or otherwise encumbered (restricted, cancelled, escheated, etc.).

Inquiries

Insured depository institutions are required to make inquiries by the end of the fifth business day after a securities certificate comes into their possession, provided that such inquiries shall be made before the certificate is sold, used as collateral, or sent to another reporting institution (which includes broker dealers, transfer agents, and clearing agencies). Inquiries are not required if the securities certificate:

- Was received directly from the issuer or issuing agent at the time it was issued;
- Was received from another reporting institution or Federal Reserve bank or branch;
- Was received from a bank customer and is registered in the name of the customer or its nominee, or was previously sold to the customer as verified by internal bank records;
- Was part of a transaction having an aggregate face value of $10,000 or less in the case of bonds, or an aggregate market value of $10,000 or less in the case of stocks; or
- Was received directly from a drop that is affiliated with a reporting institution for the purposes of receiving or delivering certificates on behalf of the reporting institution.

Reporting

Reporting requirements vary based upon the type of issue being reported and the type of entity doing the reporting. In general, banks should report:

- Stolen security certificates (or the loss of any securities where criminal activity is suspected), to the SIC and the registered transfer agent for the issue, within one business day of the discovery. If the certificate numbers of the securities cannot be determined within one business day, they should be reported as soon as possible. Stolen securities must also be promptly reported to the Federal Bureau of Investigation.

1 The Financial Industry Regulatory Authority (FINRA) is an independent regulator for securities firms doing business in the U.S.

- Security certificates missing or lost for a period of two business days, to the SIC and the registered transfer agent, within one business day of the discovery. Certificates lost, missing, or stolen while in transit shall be reported by the delivering institution.
- Counterfeit securities to the SIC, transfer agent, and Federal Bureau of Investigation within one business day of the discovery.
- Otherwise impaired security certificates on a voluntary basis. The SEC encourages institutions to report on and inquire about encumbered certificates that are not specifically subject to Rule 17f-1, such as restricted, cancelled, or escheated certificates.

Banks that recover a lost, missing, or stolen securities certificate must report recoveries to the SIC and registered transfer agents within one business day of recovery. The recovery of certificates that were reported lost, missing or stolen and involved allegations of criminality must also be reported to the Federal Bureau of Investigation.

Banks must report lost, stolen, or counterfeit items on SEC Form X-17F-1A. Reports to the Federal Bureau of Investigation may be made on SEC Form X-17F-1A or Suspicious Activity Reports.

Note: Institutions must file a Suspicious Activity Report (SAR) with the Financial Crimes Enforcement Network within 30 days of discovery for:

- Insider abuse involving any amount,
- Transactions aggregating $5,000 or more where a suspect can be identified, or
- Transactions aggregating $25,000 or more regardless of potential suspects.

Refer to 17 CFR Part 240, Rule 17f-1 for a complete description of all reporting requirements.

Exemptions

The following types of securities are not subject to the SEC's inquiry and reporting requirements:

- Security issues not assigned CUSIP numbers,
- Bond coupons,
- Uncertificated securities,
- Global securities issues, and
- Any securities issue for which a negotiable securities certificate cannot be obtained.

Examination Considerations

Examiners should periodically:

- Ensure banks are directly or indirectly registered, or exempt from SEC registration requirements;
- Discuss Rule 17f-1 with bank personnel to evaluate their understanding of the rule;
- Review documentation relating to inquiries and reporting to ensure compliance with the rule; and
- Assess the adequacy of audit procedures covering the lost and stolen securities program.

Examiners should cite noncompliance with SEC Rule 240.17f-1 as an apparent violation on the Violations of Laws and Regulations page.

Improper and Illegal Payments

The Foreign Corrupt Practices Act (FCPA) and the Federal Election Campaign Act (FECA) cover improper and illegal payments by banks and bank holding companies. The FCPA prohibits bribes to foreign government officials to obtain or keep business.

The FECA prohibits national banks from making contributions relating to elections to any political office, including local, state, and federal offices. State-chartered institutions are also prohibited from contributing to any federal office, but may make contributions connected to state and local elections if authorized under their state's laws. However, all contributions must be properly authorized and recorded.

Improper methods for making political contributions may involve falsified expense accounts, below-market rate loans, providing equipment or services without charge, and paying bonuses to employees or excessive fees and salaries to officers that are then contributed to a campaign. These methods involve unacceptable accounting practices, and, if identified, reflect unfavorably on management and internal control and audit programs.

Examiners should consider the following items when evaluating the effectiveness of an institution's controls over political contributions.

1. Determine whether the bank has a policy prohibiting improper or illegal payments, bribes, kickbacks, loans, etc., relating to domestic and foreign governments or political campaigns.

2. If the bank has such a policy, review and analyze it for adequacy, and determine if it is appropriately communicated to officers, employees, and agents of the bank.

3. Review any audits or reports that evaluate policies or operations relating to funds or services provided in

connection with political campaigns. In addition, review any investigative reports generated by other government agencies.

4. Review and analyze any internal or external audit programs relating to political contributions and determine if the programs include appropriate procedures for discovering and reporting improper practices or illegal payments. Determine whether the programs remind auditors to be alert to any unusual entries or charges that might involve improper or illegal payments, and review the results of any related audits.

5. Analyze the general adequacy of internal controls to determine whether there is sufficient protection against improper or illegal payments under the aforementioned statutes.

6. If examination analysis indicates political-contribution audit programs or internal controls are inadequate, examiners should consider performing additional analysis, such as:

   - Reviewing income and expense account entries (and supporting documentation) since the last examination for large or unusual items.
   - Reviewing bank-controlled accounts, such as dealer reserves and cash/collateral accounts, to determine the validity of entries and adequacy of customer notifications. With respect to official bank checks, review copies of the checks and supporting documentation for unusual items or checks to political organizations or related individuals.
   - Reviewing charged-off loan files to determine the appropriateness of any charge-offs to government officials, or political candidates or political organizations.
   - Review new loan and time deposit relationships with public entities and municipalities that originated since the prior examination. Inquire about the nature and source of the new relationship(s). If inquiries raise suspicions, review credit underwriting documents and trace loan proceeds to resolve outstanding questions or concerns. Similar procedures should be conducted for customers identified as Politically Exposed Persons.

7. When performing routine examination procedures, examiners should be alert for any transactions, or the use of any bank services or equipment, that might involve bribes, political campaigns, or inappropriate political activities. The activities may be identified through the review of items such as:

   - Loans or lines of credit;
   - Income and expense entries;
   - Director, officer, and employee deposit accounts or overdrafts; and
   - Official checks and escrow accounts.

- Manual Section 9.1, Bank Fraud and Insider Abuse

DEFINITIONS AND AUTHORITIES

Sections 23A and 23B of the Federal Reserve Act (FR Act), as applied by the Federal banking agencies under various Federal banking statutes, govern transactions between banks and affiliated business organizations. The Gramm-Leach-Bliley Act (GLBA) amended many laws governing the affiliation of banks and other financial service providers. Among other laws, the GLBA amended the Banking Act of 1933, the Bank Holding Company Act of 1956, (BHC Act), the Interstate Banking and Branching Efficiency Act of 1994, the Investment Company Act of 1940, the Investment Advisers Act of 1940, the Securities Exchange Act of 1934, the International Banking Act of 1978, the FR Act, the Federal Deposit Insurance Act (FDI Act), and the Home Owners' Loan Act.

Section 18(j) of the FDI Act extends the provisions of Sections 23A and 23B of the FR Act to state nonmember banks. Section 23A regulates transactions between a bank and its "affiliates," as that term is specifically defined in Section 23A. Section 23B of the FR Act was enacted as part of the Competitive Equality Banking Act of 1987 to expand the range of restrictions on transactions with affiliates. Section 10(b)(4) of the FDI Act authorizes FDIC examiners in the course of examining insured banks "to make such examinations of the affairs of any affiliate of any depository institution as may be necessary to disclose fully --- (i) the relationship between such depository institution and any such affiliate; and (ii) the effect of such relationship on the depository institution." "Affiliate" is defined in Section 3(w)(6) of the FDI Act as having the same meaning as the definition of that term in Section 2(k) of the BHC Act.

FDIC's enforcement authority also extends to certain parents and affiliates which are not bank holding companies. Section 3(u) of the FDI Act defines "institution affiliated parties" to include the controlling stockholder of an insured depository institution, or any shareholder or person who participates in the conduct of the affairs of an insured depository institution, or any independent contractor who participates in certain acts which cause significant adverse affect on an insured depository institution. This would include the parent companies of Industrial Loan Companies and other "non-bank" charters. Under Section 8(b) of the FDI Act, the FDIC can issue Orders against institution affiliated parties.

This section of the Manual discusses affiliates and subsidiaries, including the restrictions on transactions between affiliates and insured banks, exceptions to those restrictions, and the examination authority of the FDIC with respect to affiliates of nonmember insured banks. It also discusses the major provisions of the GLBA as affecting such transactions and the statutory implications for the FDIC examination process.

GRAMM-LEACH-BLILEY ACT (GLBA)

The passage of the GLBA significantly expanded the powers of bank subsidiaries of bank holding companies to engage in "financial activities," including offering insurance and securities products. The GLBA added Section 46 of the FDI Act that prescribes the circumstances in which an insured state bank may engage in financial activities as principal that may be conducted by a national bank only through a financial subsidiary. The GLBA also repealed the restrictions on banks affiliating with securities firms which were contained in Section 20 of the Glass-Steagall Act and repealed the prohibition on interlocking directors between banks and securities firms contained in Section 32.

Financial Holding Company

The GLBA authorizes the organization of a "financial holding company" (FHC) under Section 4 of the BHC Act. A FHC can engage in any activity, and may acquire shares of any company engaged in any activity, that the Board of Governors of the Federal Reserve System (the FRB) determines to be either financial in nature or incidental to such financial activity, or complementary to a financial activity and does not pose a substantial risk to the safety or soundness of depository institutions or the financial system generally.

The GLBA identifies some specific activities which are determined to meet this test and prescribes a consultative process involving the shared input of both the FRB and the Secretary of the Treasury for future definition of activities determined to meet the test.

Section 4(k)(4) of the BHC Act identifies a list of specific activities deemed "financial in nature" for these purposes. Qualifying FHCs may engage in such activities without regulatory approval provided notice is given to the FRB within 30 days after the activity is commenced. The listed activities include:

- Lending, exchanging, transferring, investing for others, or safeguarding money or securities,
- Insuring, guaranteeing or indemnifying against loss or illness, or issuing or providing annuities, as principal, agent or broker,

- Providing various forms of financial, investment or economic advisory services, including advising investment companies,
- Issuing and selling instruments representing interests in pools of assets permissible for a bank to hold directly,
- Securities underwriting, dealing and market making,
- Engaging in activities that have been determined to meet the “closely related” and “proper incident” tests under Section 4(c)(8) of the BHC Act,
- Engaging in activities in the United States that the FRB has previously authorized bank holding companies and their subsidiaries to conduct abroad under Section 4(c)(13) of the BHC Act,
- Certain merchant banking activities, and
- Certain “insurance company portfolio investment” activities.

Conditions Precedent to New Activities:

The following guidelines exist relative to a bank holding company entering into new activities:

- All depository institution subsidiaries of the bank holding company must be “well capitalized” and “well managed.”
- A “satisfactory” or better CRA rating must have been received by all of the depository institution subsidiaries at their most recent examination.
- The bank holding company must file with the FRB an election to become a financial holding company.
- There is a grandfather provision for certain non-conforming activities of a company that is not now a bank holding company but then becomes one to continue to engage in commercial activities in an amount not to exceed 15 percent of its consolidated annual gross revenues, excluding bank subsidiaries. The grandfather provision will expire ten years after the date of enactment, unless extended by the FRB for an additional five years.

The FRB is the umbrella supervisor for FHC’s. As such, the FRB assesses the FHC’s overall financial condition and the systems for monitoring risks for the entity as a whole.

Financial Subsidiaries

Implementing Section 121 of the GLBA as it pertains to state nonmember banks, the FDIC added Subpart E to Part 362 of its regulations. For purposes of Subpart E, a “financial subsidiary” is defined as a subsidiary that is controlled by a state nonmember bank and engages as principal in activities which may be conducted by a national bank only through a financial subsidiary. Most activities that were identified in the GLBA as being financial in nature are already permissible for a national bank to conduct directly.

The statutory criteria that must be satisfied in order to engage in activities through a financial subsidiary are:

- The state nonmember bank and each insured depository institution affiliate of the state nonmember bank must be and continue to be well capitalized after deducting the bank’s investment, including retained earnings, in all financial subsidiaries.
- The state nonmember bank must disclose the capital deduction and the separate assets and liabilities of the subsidiary in any published financial statement.
- The state nonmember bank must comply with the ongoing financial and operational safeguards required by Section 5136A(d) of the Revised Statures of the United States, which requires operational safeguards to separate the bank from the risks of the subsidiary.
- The state nonmember bank must comply with the amendments to Sections 23A and 23B of the FR Act made applicable by Section 121(b) of the GLBA that require certain ongoing transactional restrictions.
- The state nonmember bank and all of its insured depository affiliates must have received a CRA rating of not less than a “satisfactory record of meeting community credit needs” in its most recent CRA examination.

Functional Regulation

The GLBA also provides for the functional regulation of securities and insurance activities. This means that similar activities should be regulated by the same regulator so as to promote regulatory efficiencies and eliminate burden and duplication. Accordingly, banking activities are to be regulated by bank regulators, securities activities by securities regulators and insurance activities by State insurance departments. In order for functional regulation to be effective, certain consultation and information-sharing requirements are also contained in the statute.

The BHC Act was amended to restrict the authority of the FRB to require reports, conduct examinations, impose capital requirements or take any other direct or indirect action with respect to any functionally regulated affiliate of a depository institution. Section 45 was added to the FDI Act, which made these restrictions applicable to the FDIC.

It is still necessary to determine the significance of the activities conducted by the functionally regulated subsidiaries and determine whether the level of such activities could pose a material risk to the insured depository institution. This functional regulation concept does not, however, alter the Corporation's authority under Section 10(b)(4) of the FDI Act to examine affiliates "as may be necessary to disclose fully (i) the relationship between the depository institution and the affiliate; and (ii) the effect of such relationship on the depository institution."

A functionally regulated entity under the GLBA means a company:

- Engaged in insurance activities (as agent or principal) supervised by State insurance commissioners;
- Registered with the Securities and Exchange Commission (SEC) as an investment company under the Investment Company Act of 1940;
- Registered as an investment adviser either with the SEC or any State; or
- Engaged in commodity activities regulated by the Commodities Futures Trading Commission.

EXAMINATION AUTHORITY

The authority of examiners to examine all affiliates of State nonmember banks is contained in Section 10(b) and 10(c) of the FDI Act. In exercising the authority to examine State nonmember insured banks and their affiliates, examiners are empowered by Section 10(b) to make a thorough examination of all of the affairs of the bank and its affiliates and are directed to make a full and detailed report of condition of the bank to the FDIC. The authority to examine affiliates extends to those entities set forth in Section 23A of the FR Act.

The manner in which such examinations are conducted, and the format of the reporting on their condition, are not specified by either regulation or specific policy guidance. This is the case for two reasons. First, the type of affiliate and the nature of transactions with the insured institution can vary significantly; requiring sometimes more or less review, and typically a far different type of analysis than would be conducted for financial institution affiliates. Second, the risk presented by the activities of affiliates to the insurance fund is likely to be indirect, especially for those not engaged in direct transactions with the insured institution. Examinations under the FDIC's 10(b) authority will need to be tailored to the level of risk to which the insured institution is exposed as a result of transactions between, and the operations of, the relevant affiliates.

In addition, Section 10(c) of the FDI Act empowers the FDIC to issue, in the course of an examination, subpoenas and to take and preserve testimony under oath related to any matter in respect to the affairs or ownership of any such institution or affiliate. Accordingly, individuals, corporations, partnerships, or other entities which in any way affect the bank's affairs or ownership may be subpoenaed and required to produce documents under the FDIC's Section 10(c) powers.

Proper use of Section 10(c) powers can be a valuable aid to the FDIC in carrying out its supervisory responsibilities. However, the reasons why examinations of affiliates are considered advisable or necessary by the examiner should be documented, and the extent of any such examination should have prior clearance from the Regional Office. The exercise of Section 10(c) powers will require extensive legal documentation and should only be initiated following authorization from the Director, DSC.

BANK HOLDING COMPANIES

Under Section 2 of the BHC Act a "bank holding company" is defined to include any corporation, partnership, business trust, association, or similar organizations, or any long-term trust (one which extends beyond 25 years or 21 years and 10 months after the death of individuals living on the effective date of the trust) which has control over any bank or over any bank holding company. A bank, of course, is a company and, therefore, may be a bank holding company if it controls another bank or bank holding company. By virtue of amendments to the BHC Act, one-bank holding companies, partnerships, and under certain circumstances, bank trust departments are within BHC Act limits. An existing BHC may become an FHC by notifying the FRB of its election to do so. The BHC must certify that each of the FHC's insured depository institution subsidiaries is well capitalized and well managed.

Definition of Control

Under the BHC Act, a company has control over a bank or any other company (1) if it directly or indirectly owns, controls, or has the power to vote 25 percent or more of any class of voting securities of such bank or other company, (2) if it controls, in any manner, the election of a majority of the directors of such bank or other company, or (3) the FRB determines, after notice and hearing, that the company exercises a controlling influence over the management or policies of the bank or company. Shares owned or controlled by any subsidiary of a bank holding company are considered to be indirectly owned or controlled by the holding company. Shares held or controlled directly or indirectly by trustees for the benefit of a company or the shareholders or employees of a company are deemed to be controlled by the company. Refer to FRB Regulation Y, Section 225.2 for further clarification.

There is also a rebuttable presumption of control if the FRB, as authorized, finds that a company directly or indirectly exercises a controlling influence over the management or policies of the bank or bank holding company. In order to establish guidelines implementing these sections of the BHC Act, the FRB has adopted the following presumptions of control that may be rebutted by the affected company:

1. A company that owns, controls, or has power to vote more than 5 percent of the voting securities of a bank or bank holding company if; one or more of the company's directors, trustees or partners, or officers or employees with policy-making functions, serves in any of these capacities with the bank or holding company, and no other person owns, controls or has power to vote as much as 5 percent of any class of voting securities of the bank or bank holding company.
2. A company that owns, controls or has power to vote more than 5 percent of any class of voting securities of a bank or bank holding company if; additional voting securities are owned, controlled or held with power to vote by individuals or members of their immediate families (spouse, children, grandchildren, parents or their ancestors, stepchildren or stepparents, all whether natural or adopted) who are directors, officers, trustees or partners of the company (or own directly or indirectly 25 percent or more of any class of voting securities of the company) and such holdings together with the company's holdings aggregate 25 percent or more of any class of voting securities of the bank or bank holding company. The presumption does not apply under (1) and (2) where securities are held in a fiduciary capacity and the company does not have sole discretionary authority to exercise the voting rights.
3. A company that enters into any agreement or understanding with a bank or bank holding company (other than an investment advisory agreement), such as a management contract, pursuant to which the company or any of its subsidiaries exercises significant influence with respect to the general management or overall operations of the bank or bank holding company presumably controls such bank or bank holding company.
4. A company that enters into an agreement or understanding under which the rights of a holder of voting securities of a bank or other company are restricted in any manner, presumably controls the shares involved unless the agreement; is a mutual agreement among shareholders granting each other a right of first refusal with respect to their shares, is incident to a bona fide loan transaction, or relates to restrictions on transferability and continues only for such time as may reasonably be necessary to obtain from a Federal bank supervisory authority with respect to acquisition by the company of such securities.
5. A company that directly or indirectly owns securities that are convertible immediately at the option of the holder or owner into voting securities, presumably owns or controls the voting securities.

In addition to the foregoing, the FRB may, under its regulations, administratively determine that a company controls a bank or other company. Congress has apparently established 5 percent as the benchmark for determining whether or not “control" exists and the FRB has to a great extent incorporated that benchmark into its regulations dealing with the rebuttable presumption of control. Accordingly, under the BHC Act, there is a presumption that a company does not have control over a bank or other company if the company directly or indirectly owns, controls, or has the power to vote less than 5 percent of the voting securities of such bank or other company. Furthermore, a company does not have control of a bank or other company unless at the time in question that company directly or indirectly owned, controlled, or had power to vote 5 percent% or more of the voting securities of a bank or other company, or had already been found to have control by the FRB after notice and opportunity for hearing.

PARENT COMPANIES WHICH ARE NOT BANK HOLDING COMPANIES

The primary forms of insured bank whose parent company does not fall under the definition of Bank Holding Company (BHC) or Financial Institution Holding Company for the purposes of the Bank Holding Company Act (BHCA), are the Industrial Loan Company (ILC) and the Savings Bank. Both of these insured entities are otherwise defined as banks under Section 3 of the FDI Act.

ILCs are defined for the purposes of the BHCA exemption, Section 2c(2)(H), as “… an institution … which does not accept demand deposits … ; which has total assets of less than $100 million … or ; which is not acquired by any company after the … enactment of the Competitive Equality Amendments of 1987; or is an institution which does not … engage in any activity in which it was not lawfully engaged as of March 5, 1987 …” Savings Banks are defined in Section 3g of the FDI Act, and are essentially State Savings Banks.

The Competitive Equality Banking Act (CEBA) of 1987, in redefining a bank as any bank insured by the FDIC and eliminating the loophole in the BHCA for institutions that accepted demand deposits or made commercial loans but not both, also created a small group of grandfathered institutions. These "CEBA" banks are also known as "non-bank banks," have the same activity restrictions as do ILCs, and their parent companies would also not necessarily have to be Bank Holding Companies. The growth in the "non-bank bank" charter, entities sometimes called limited charter institutions, is now primarily in ILCs.

While some limited charter institutions are owned by bank holding companies, most are owned by parent companies whose limited activities and primary purpose of owning the insured institution, make these parents virtually identical to the shell bank holding company. However, ILCs can be owned by commercial parent companies. Some of these corporations are otherwise engaged in a diversity of business activities which would otherwise preclude them from owning a bank and being a bank holding company. These commercial corporations presently include some of the largest manufacturing, insurance, retail, and investment banking firms.

For more specific information regarding the various definitions, limitations, and restrictions on non-bank financial institutions, see the relevant provisions of the BHC Act, 12 U.S.C. 1843(f)(3) and Regulation Y, 12 C.F.R. 225.2 and 225.52. These are included under the Bank Holding Company Act tab in the Prentice-Hall volumes.

CEBA Credit Card Banks

CEBA credit card banks are also exempt from the BHC Act and may be owned by commercial entities. Their operations are restricted to only issuing credit cards, accepting no demand deposits, accepting only jumbo deposits ($100,000 minimum), having only one office, and not making any commercial loans.

Unitary Thrift Holding Companies

Prior to the enactment of the GLBA, any company, regardless of its activities, could acquire a single savings association if the prospective subsidiary satisfied the qualified thrift lender test (QTL).[1]

The advantages of that charter included preferential taxation, liberal branching rights, expanded subsidiary powers and virtually unlimited holding company activities. Many of the thrifts with this charter were owned by commercial entities.

The GLBA prohibits the creation of new unitary thrift holding companies that engage in commercial or other nonfinancial activities. The GLBA did, however, grandfather most unitary thrift holding companies in existence as of May 4, 1999.

Industrial Loan Companies

Industrial Loan Companies (ILCs), also known as industrial banks, are state-chartered banking institutions. While only permissible in a limited number of states, they generally have broad banking powers, and under certain circumstances ILCs may be owned by commercial entities. Specifically, an ILC that meets certain criteria is not a "bank" under the BHC Act, and any company that controls such an ILC would not be subject to FRB regulation and supervision as a bank holding company. [2] Most ILCs have Federal deposit insurance (made available under the Garn-St. Germain Depository Institutions Act of 1982 legislation) and are regulated in a similar manner to state-chartered commercial banks.

Core ILC functions are traditional financial activities that can commonly be engaged in by institutions of all charter types. An ILC can:

- offer a full range of deposits, except demand deposits (unless grandfathered);
- offer a full range of loans and other financial services to both consumer and commercial customers;
- be an original issuer of Visa or Master Card credit and debit cards;
- fund its operations with deposits and Federal Home Loan Bank (FHLB) borrowings.

If an ILC is organized as a limited purpose or credit card institution, then its products and services would be limited to specified activities.

The GLBA did not repeal the ILC exception contained in the BHC Act. As such, commercial firms may continue, as State law permits, to acquire and control ILCs without complying with the BHCA so long as the ILCs satisfy the criteria for the exception. In the case of a parent subject to the reporting requirements of another regulatory body covered under the GLBA, such as the SEC or a State insurance commissioner, the FDIC has agreements in place to share information with such functional regulators. In examining any insured depository institution, the FDIC has the authority (under 12 U.S.C. § 1820(b)(4)) to examine any affiliate of the institution, including its parent company, as may be necessary to determine the relationship between the institution and the affiliate and to determine the effect of such relationship on the institution.

Unique Characteristics of Commercial Parent Companies

Certain bank charters, such as ILCs, may have commercial parent companies in place of a traditional bank holding company or financial institution holding company. As with bank holding companies, these commercial parents can be a source of strength for their subsidiary bank by providing access to the capital and debt markets, and affording the opportunity to use a variety of technical services not always available to small or mid-size banks.

However, commercial parents also present different management challenges to the insured institution and different analytical challenges to examiners. Commercial parents may not be able to offer additional management expertise directly relevant to financial institutions. In serving the specific financial needs of a commercial company, a niche bank may be insufficiently diversified against credit or liquidity risks. Further a financial catastrophe at a parent or affiliate, unrelated to the business of the insured institution, could result in an unanticipated but immediate disruption to the earnings or operations of the insured entity.

Moreover, assessment of "extra-insured" risk factors cannot be made with the comparatively straight-forward ratio analysis used for evaluating bank holding companies. Commercial firms present more varied revenue streams and business risks. Further, while a clearly identified weakness in the insured institution will generally determine the need to conduct an assessment of the potential source of strength provided by the commercial parent, any determination of a "potential source of weakness" presented by a parent or affiliate to an otherwise healthy insured entity will be far more complex. Examiners should only undertake such an assessment following consultation and direction from the Regional Office.

For non-bank holding companies or commercial parent entities, some possible sources for financial analysis include: parent entity quarterly or annual reports, Securities and Exchange Commission filings such as 10-Ks, 10-Qs, etc., bank records on affiliates, external industry analysis sources (i.e. Moody's Standard and Poor's, etc.), internal and/or external audits, corporate press releases, newspaper articles, etc.

HOLDING COMPANY EFFECT ON SUBSIDIARY BANKS

A sound, well-managed holding company can be a source of strength for unit banks; however, if the condition of the holding company or its nonbank subsidiaries is unsound, the operation of subsidiary banks can be adversely affected.

Management

The long-term health of an institution depends on a strong, independent and attentive board. The board sets the overall tone and direction of the institution and establishes policies and procedures concerning the nature and amount of risk the institution may take.

Solid corporate governance principles recognize the following elements necessary for the successful operation of the depository affiliated institution:

Each member of the board of directors should have the skills, integrity, knowledge, and experience necessary to allow the director to fulfill his or her responsibilities to the insured institution. The qualifications should be considered in light of the institution's size, complexity and risk profile. Board membership should be considered not only on an individual basis, but also collectively such that the composition provides a well rounded set of skills, knowledge, and experience.

The board of directors is responsible for actively overseeing the affairs of the institutions. This oversight should include:

- Reviewing and approving major corporate actions and the institution's overall corporate strategies, business plans, performance objectives, risk policies and risk tolerances,
- Monitoring the institution's adherence to the strategies, plans, objectives, risk policies and risk tolerances approved by the board, including policies and standards relating to conflicts of interest management,
- Reviewing appropriate regulatory and audit reports, and
- Taking appropriate action with respect to all matters requiring board attention.

The board of directors is responsible for ensuring that the institution, its directors, management, principal shareholders, and affiliates avoid potential direct and indirect conflicts of interest and comply with Federal laws and regulations that are designed to prevent misuse of depositors' funds.

The board of directors is responsible for hiring and retaining executive officers with the skills, integrity, knowledge and expertise appropriate to the nature and scope of their responsibilities. Executive officers must have the ability to manage day-to-day operations to achieve the institution’s performance goals. They should also possess the industry expertise to assess the institution’s current performance and condition and to help the board plan for the institution’s future.

The board of directors is responsible for establishing and maintaining appropriate committees, and that written charters delineating each committee’s functions, responsibilities and membership qualifications have been adopted by the full board.

The board of directors is responsible for ensuring that the insured depository institution maintains a separate corporate existence from its affiliates. This separateness also pertains to the sound tenet that all financial and other pertinent records for the financial institution affiliate be accessible on location.

Financial Considerations

The holding company structure can provide its subsidiary bank strong financial support because of greater ability to attract and shift funds from excess capital areas to capital deficient areas. The financial support can take the form of equity capital injections and/or the funding of loans and investments. However, when the financial condition of the holding company or its nonbanking subsidiaries is tenuous, pressures can be exerted on the subsidiary banks. In order to service its debt or provide support to another nonbank subsidiary, the holding company may place inordinate financial pressure on its subsidiary banks by any of the following methods: payment of excessive dividends; pressure subsidiary banks to invest in high risk assets to increase asset yields; purchase and/or trade its high quality assets for the other affiliate's lower quality assets; purchase of unnecessary services from affiliates; or payment of excessive management or other fees.

Although no formal policy statement has been issued by the FDIC, it has long been the FDIC's position that management and other fees paid by subsidiary banks should have a direct relationship to the value of actual goods or services rendered based on reasonable costs consistent with current market values for such services. Bank files should contain adequate information to permit a determination as to what goods and services are being provided and on what basis they are being priced. Charges should not be based on resources, deposits, or earnings of the bank. In those instances when payments are large and are not or could not be justified on the basis of services received by the bank, a comment should be included in the Report of Examination.

An additional method of upstreaming funds from a bank to its parent is through the remittance of income taxes to the parent that then files a consolidated income tax return. Due to timing differences arising from the use of different accounting methods for Reports of Condition and Income (Call Reports) and for income tax purposes, a portion of taxes reflected in Reports of Income and Condition will be deferred; however, in certain instances, banks are required to remit to the holding company the entire amount of income tax expense, both current and deferred. The FDIC's Statement of Policy Income Tax Remittance by Banks to Holding Company Affiliates, indicates past transfers of this kind shall be restated on the bank's books and future tax transfers shall only include the current portion of income tax expense.

Even when the holding company is financially sound, supervisory concerns may arise as the parent issues long-term debt to fund equity capital in the subsidiaries. Although this capital raising activity, known as "double leveraging," does increase equity capital in the subsidiary, too much debt at the holding company level can generate pressure on the subsidiary to upstream additional dividends. Since the holding company often services the debt with dividends from the lead bank, holding company debt service requirements which come to exceed historical dividend payment ratios may place undue earnings pressure on the bank. Should dividends be insufficient, the holding company may attempt to create other means of generating cash, such as charging the subsidiary for management and operating expenses.

The double leverage ratio is the equity of the subsidiary, or in the case of multiple subsidiaries the combined equity of all the subsidiaries; divided by the equity of the holding company. A holding company with a ratio of 100% or less, is not using double leverage. The amount of double leverage a holding company can comfortably carry can depend on various factors; but analysis should center on the amount of earnings or cash flow which the subsidiaries, or the lead bank if the lead bank generates most of the combined company’s earnings, can upstream to the parent. Even holding companies with comparatively modest double leverage ratios can negatively affect the bank if the non-bank subsidiaries produce negative cash flow. Other leverage ratios which attempt to isolate or incorporate different segments of the holding company’s capital structure (preferred stock or minority interests for example) can be useful for assessing more complex organizations.

Fixed charge coverage is a ratio that measures the ability of the parent company to cover its interest expense. The ratio is computed by determining how many times the parent's total interest expense is "covered" by the net of parent operating income (excluding "equity in undistributed earnings") less parent operating expenses other than interest and taxes. Interest expense is defined to include one- third of parent rental expense (if any), as though premises and equipment had been mortgaged rather than leased. A bank holding company parent's position is generally considered comfortable if it shows a coverage ratio of 2 times or better. A ratio of less than 1 points to a condition of cash flow deficit, without taking debt amortization or shareholder dividends into consideration. This ratio can be misleading if there is an abnormal dividend payout from subsidiaries, the major source of income to a parent. If the payout of all subsidiaries is only 20 percent (but could be 60 percent), the coverage ratio could be very low, perhaps well under 2 times. Conversely, if the payout of earnings is an unsustainable high 90 percent, the coverage ratio could temporarily appear adequate. Therefore, it is essential to be aware of actual dividend payout from subsidiaries to the parent before final interpretation of this ratio.

Cash flow match is a more severe test of parent cash availability to meet not only interest expenses, but also operating expenses, taxes, shareholder dividends, and debt maturities. Cash "sources" are defined as all parent operating income plus tax credit (or minus taxes paid). Cash "uses" are defined as operating expenses (including interest), dividends to shareholders, and debt principal due in one year. A coverage ratio of 1.10 "times" (i.e., cash sources are 110 percent of uses) is generally considered comfortable. Many highly profitable, underleveraged BHCs reflect ratios of 1.20 times or better. Ratios under 1.00 need additional study, as the presumption is that cash flow is insufficient to maintain BHC credit, which bears upon the viability of the institution. Like the fixed-charge coverage test, this ratio also needs adjustment to be interpreted in light of subsidiaries' dividend levels. The amount of debt due in one year usually does not reflect a normalized amortization schedule, since balloon and bullet maturities create a year-to-year instability in the "amount due.” If sufficient data were available, it would be more appropriate to arbitrarily introduce a "normalized" amortization schedule based on the average life of parent debt outstanding. Finally, not all parent debt needs to be serviced from parent operating income. Much of this debt is covered or matched by advances to profitable subsidiaries, so that servicing of principal is in essence automatic. Therefore, a true cash flow test would apply only to "uncovered" parent debt and only the amortization of this portion needs to be normalized in the manner described.

These cash flow measures are the best indicators of the financial support a parent company can provide to a subsidiary bank. Asset size, capitalization, revenue or profitability; even relative to the size of the insured institution, are imperfect measures for gauging potential support.

Other ratios that can be used when analyzing holding companies are included on the Relationship with Affiliates and Holding Companies page of the Report of Examination. These ratios are generally available from the Uniform Bank Holding Company Performance Report.

Economies of Scale

The holding company structure can provide significant benefits from economies of scale in areas such as audit, and data processing services, etc. Effective review of the examination report by the holding company and implementation of recommendations contained therein should assist the FDIC in the supervision of subsidiary banks.

Dual Employees

These economies of scale could extend to the employees in the case of “dual employees” or those that perform essentially the same duties for a banking entity and the affiliated organization. The use of dual-employees can be a cost-effective manner for leveraging in-house expertise or for employees that specialize in certain core competencies. Nonetheless, the use of dual-employee arrangements may present increased risk to an insured banking entity if the institution, or its management, fails to adequately monitor the hiring, training, activities, reporting, or expertise of dual-employees.

Any dual officer or employee arrangements should be consistent with sound principles of corporate governance. All bank activities, including those performed by dual employees, should be subject to the authority of an independent board of directors. Bank officers (whether they are dual employees or direct employees) must have sufficient expertise, authority, and information to act in the best interests of the insured institution at all times, under the direction of the board. A comprehensive framework of policies, procedures, legal agreements, controls, and audit must be established to govern the activities of dual officers and employees. A formal written employee sharing agreement should be established to define the employment relationship between the banking entity and affiliate. The following factors should be addressed:

- The agreement needs to be independently reviewed by the bank's board of directors to ensure that it is fair and in the best interest of the insured bank.
- Compensation arrangements need to be clearly delineated to ensure they are equitable for both the bank and affiliated entity.
- The location where the dual employee is to perform duties needs to be established and detailed, along with reporting and authority.
- The agreement should require dual employees to avoid conflicts of interest. Additionally, the agreement should state that dual employees or officers must act in the best interest of the bank while performing any activities on behalf of the bank.
- Sanctions for noncompliance should be contained in the bank's agreement.
- The agreement should provide for a periodic determination concerning the status of a dual-employee and the factors to be considered for terminating the dual-employee relationship in favor of either full-time bank or affiliated entity employment.
- Authority for managing the dual-employee relationships should be clearly assigned.
- Lines of authority for dual employees should be established. While dual employees may have other responsibilities, they must also report through appropriate lines of authority within the banking institution. The dual employee's bank responsibilities and decision-making should take precedence over any affiliate responsibilities. All activities conducted on behalf of the bank must be subject to appropriate review and authorization by bank officers, and ultimately the bank's board of directors.

Affiliate officers and employees who conduct activities on behalf of the bank (even if not formally designated as dual employees) are subject to the same level of legal and corporate duties and liabilities as a direct officer or employee of the bank. Additionally, examiners should have reasonable access to dual employees and any other affiliate employees who perform services on behalf of the bank.

Bank officers must retain control over certain key functions, including general ledger entries, regulatory reporting, cash accounts, lending activities, and investments. While dual officers and employees can provide advice and other supporting services, bank officers must retain final decision making authority. Reasonable systems should be established to ensure that bank officers have sufficient information to oversee the activities of dual officers and employees who provide services to the bank.

The institution needs to be able to devote sufficient resources for monitoring and measuring performance under the terms of the employment sharing agreement.

The extent of the relationships, including the amount of time devoted between the bank and an affiliated entity, need to be periodically reported to the directorate or an appropriate committee.

The insured banking institution utilizing a dual-employee needs to have policies and procedures in place covering account settlement for dual-employees that stipulate the manner and timing for payment in order to ensure an unanticipated affiliated loan does not occur in contravention of Sections 23A & 23B of the FR Act.

Policies and procedures dealing with dual-employee relationships should include a mechanism to ensure compliance with 12 U.S.C 1831g (Adverse Contracts). Under that statute, an institution may not enter into a written or oral contract with any person to provide goods, products, or services to, or for the benefit of, a depository institution if the performance of such contract would adversely affect the safety and soundness of the insured institution.

Examiners should review and evaluate arrangements involving shared employees and/or management for the items discussed above.

Miscellaneous Considerations

The principal benefit of bank holding companies is the tax benefit from issuing debt at the parent company level and concurrently creating equity at the bank level. Most one bank holding companies which engage in minimal other activity aside from holding the stock of the bank, were created for this purpose. The Federal Reserve ruling permitting treatment of Trust Preferred Stock as Tier 1 capital for regulatory purposes, while simultaneously allowing the consolidated holding company to treat it as debt for tax purposes, further added to the attractions of the one bank holding company.

Many of the smaller one-bank holding companies receive infrequent inspection by the Federal Reserve. Ordinarily the holding company financial statements reflect little more than the bank investment and acquisition debt. It is expected that where debt-servicing requirements may impact bank earnings, appropriate comments will be made by the examiner in the examination report. Reference is made to the Earnings section of this Manual as well as the instructions for the preparation of the Relationships with Affiliates and Holding Company report page.

Another major benefit to an individual bank that belongs to a multi-bank holding company is that it can better serve its customers by participating loans exceeding its legal lending limit. A problem could result from this practice if the loan granted exceeds the management expertise of any of the participants.

Examiners should review and evaluate current business plans and any changes thereto since the previous examination. Business plans in most instances should be reduced to written form. It is recognized that the depth and detail of written plans may properly vary, depending on the nature, scope and complexity of their operations. Occasionally, examiners may encounter situations where written plans have not been developed. In these instances, frequent and ongoing communication with management is imperative. The necessity for a written plan may be inferred from the results achieved by management to a considerable degree.

Examiners should assess whether all service relationships provided by affiliates are governed by a written agreement. Refer to Sections 23A and 23B of the FR Act for additional information on affiliate transactions.

Examiners should also determine whether the bank should have a contingency plan for all critical business functions performed by affiliated companies. Refer to outstanding Information Technology (IT) examination guidance for specifics on contingency planning.

The Potential Impact of Holding Companies on Uniform Bank Ratings

The relationship between a bank and its parent holding company and the financial condition of the holding company could affect, to a significant degree, each of the component factors in the CAMELS rating as well as the composite rating.

The financial, technical, and managerial capacity of holding companies, commercial parents, and other affiliates can provide significant and often substantial support to a subsidiary bank. This is particularly true when the bank is a comparatively small component of a much larger corporate organization.

It will not always be necessary for examiners to conduct a detailed assessment of whether a parent company can be considered a source of strength for the subsidiary financial institution. If the subsidiary bank ratings are not dependent on the resources or support of the holding company, it will not normally be necessary to conduct a detailed assessment of the parent company or affiliates. Most bank holding companies have little financial capacity independent of the bank; and are likely to provide little independent support.

In the case where a complex commercial parent company has the potential capacity to support the subsidiary bank but does not clearly dominate the bank by virtue of size, revenues, or earnings, a more detailed examination of the parent may have to be conducted if it should become necessary to show conclusively that the bank ratings should reflect the holding company as a source of strength. However, conduct of a parent company examination should be dependent first on the independent financial condition of the insured institution, the extent of risk exposure resulting from direct transactions between the insured institution and the parent company, and the extent to which the capacity of the parent company supports the Uniform Bank Ratings assigned.

When a holding company or parent is considered a potential source of strength to the insured institution, the weight of this influence on the assigned Uniform Bank Ratings should only incorporate the actual support provided at the current examination. A potential source of strength determination should not be based on projected future resources of the parent, but rather on a current assessment of the parent's actual financial condition. Furthermore, the benefits of parental resources and the influence of these resources on the Uniform Bank Ratings will likely change if the condition of the insured institution deteriorates. In this event, evaluation of potential source of strength should incorporate not just the capacity of the parent to support the bank, but also its present willingness to do so.

Some additional factors that may be considered in assigning a rating to the financial institution subsidiary could include:

- Capital – the ability and commitment of affiliates to contribute additional capital if needed and an assessment of the pressure from the parent organization for dividends.
- Asset Quality – the quality of the assets generated through programs associated with affiliates; ability of affiliates to provide financial guarantees or collateral, purchase low quality assets, or to arrange or develop risk mitigation transactions such as credit default swaps.
- Management – independence of management and the board of directors; ability of the financial institution affiliate to make decisions independent of parent company; adequacy of audit procedures; demonstrated willingness to address examination recommendations and follow safety and soundness principles; documentation and protocols for affiliate relationships.

- Earnings - reasonable fee structure of servicing relationships; suitability of management fees paid to affiliates.
- Liquidity – access to funding sources that would not otherwise be available.
- Sensitivity – funds management strategies that are coordinated with those of affiliates; efficacy of hedging or other market activities employed by affiliates.

TYING ARRANGEMENTS

The Bank Holding Company Act Amendments of 1970 and Title VIII of the Financial Institutions Regulatory and Interest Rate Control Act of 1978 added the so-called anti-tie-in provisions to the BHC Act. (See "Tying Arrangements" under the Bank Holding Company Act tab in the Prentice-Hall volumes.) Non-bank banks, including ILCs, are subject to the anti-tying provisions of the BHC Act as well.

Essentially, the anti-tying provisions prohibit a bank from conditioning the availability or price of any of its products or services upon the customer obtaining some other product or service from the bank or an affiliate, or upon the customer providing some other product or service to the bank or an affiliate. These provisions also preclude a bank from tying its products or services to a requirement that the customer not obtain some product or service from a competitor of the bank or an affiliate. The purpose of these provisions is to prevent banks from using their ability to offer financial products, credit in particular, in a coercive manner to gain a competitive advantage in markets for nonbanking products and services. For example, a bank may not require as a necessary condition to obtaining a loan or extension of credit that the prospective borrower lease personal property or equipment from the bank's holding company or a subsidiary thereof or that the prospective borrower provide the bank, its holding company or any subsidiary thereof with office supplies or equipment.

However, it is not intended that this provision interfere with the conduct of traditional banking practices. For example, a bank may restrict the availability or vary the price of its credit, property, or services on the condition that the customer also obtains a traditional bank product from the bank or an affiliate. A "traditional bank product" is a loan, discount, deposit, and trust service. For further information regarding other exceptions and safe harbors contact Regional Office staff. For purposes of these provisions, a natural person is treated as a bank holding company if he or she controls a bank or a company that controls a bank.

Violations of these anti-tying provisions may be addressed by the bank's appropriate Federal banking agency through an enforcement action, by United States Attorneys under the direction of the Attorney General through an action for injunctive relief, or by private parties through an action for injunctive relief as well as treble damages when they have sustained damages, or are threatened by loss or damage, by reason of a violation of these provisions.

Prohibition of Preferential Loans

Title VIII essentially prohibits preferential loans to executive officers, directors, and principal shareholders of a bank from its correspondent bank. Therefore, a bank which maintains a correspondent account for another bank is precluded from making an extension of credit on preferential terms to an executive officer, director, or principal shareholder of that bank, and a bank is precluded from opening a correspondent account for another bank if such bank has outstanding an extension of credit to an executive officer, director, or principal shareholder of that bank if it is on preferential terms. Conversely, a bank which maintains a correspondent account at another bank is precluded from making an extension of credit on preferential terms to an executive officer, director, or principal shareholder of that bank, and a bank is precluded from opening a correspondent account at another bank if such bank has outstanding an extension of credit to an executive officer, director, or principal shareholder of that bank on preferential terms. Any bank that violates or any officer, director, employee, agent, or other person participating in the conduct of the affairs of such bank who violates this prohibition shall forfeit and pay a civil penalty.

CHAIN BANKING GROUPS

From a supervisory standpoint, chain-banking groups are very similar in character to multibank holding companies. They have the ability to provide many of the benefits common to multibank holding companies as well as the ability to provide the potential for unsafe and unsound banking practices. The linkage of several banks or holding companies into a chain creates a concentration of banking resources that can be susceptible to common risks. Mutually shared risks that can arise in chain banking relationships include: poor loan participation practices, common deficiencies in lending and/or investment policies, domineering or absentee ownership, insider abuses or other self-serving practices. Unfortunately, detection and correction of these problems are largely dependent on the examination process and are complicated when the chain is composed of institutions subject to different Federal and/or State regulatory agencies.

Unlike multibank holding companies, chain banking organizations do not have to report financial information on a consolidated basis, thereby making offsite monitoring difficult. In addition, they are not subject to the same types of regulations as holding companies.

A chain banking organization is defined as a group (two or more) of banks or savings and loan associations and/or their holding companies which are controlled directly or indirectly by an individual or a company acting alone or through or in concert with any other individual or company. Control is defined as: ownership, control or power to vote 25 percent or more of an organization's voting securities; the power to control in any manner of the election of a majority of the directors of an organization; or the power to exercise a controlling influence over the management or policies of an organization. These criteria are to be interpreted narrowly. For example, institutions should not be deemed to be a chain organization simply because an individual holds a title such as chairman or president unless the individual actually has control.

The control structure of a chain organization is often complex. There may be registered holding companies within the ownership or control structure of a chain organization, but it would not be deemed to be a chain if the top holder of all the insured institutions in the group is a registered holding company. One bank under a bank holding company or several banks owned by a single bank holding company are not considered a chain banking group for purposes of maintaining a list of chain banking groups.

It is the policy of the Division of Supervision and Consumer Protection to monitor and supervise banks that are a part of a chain banking organization in a manner that fully considers the consolidated chain's financial impact on the safety and soundness of the individual institution(s). The supervisory strategy for monitoring chain organizations is included in the Case Manager's Procedures Manual.

In developing an overall supervisory strategy for chain organizations, the following factors should be considered:

- The relative size and complexity of the chain's organizational structure, including the degree of centralization of operations,
- The degree and nature of control or influence being exerted over individual institutions in the chain and the managerial style and extent of direct control or influence at each institution in the chain,
- The degree of interdependence among institutions in the chain. Particular emphasis should be given to the volume and frequency of inter-institution transactions such as: loan participations or sales; purchases or sales of securities or other assets; bank holding company or bank stock loans; insider loans or transactions; and contractual obligations for services, and
- The overall condition of the institutions in the group and the condition of the chain on a consolidated basis.

AFFILIATES

The relationship of a bank with its affiliated organizations is important to the analysis of the condition of the bank itself. Because of the commonality of ownership or management that exists, transactions with affiliates may not be subject to the same sort of objective analysis that exists in transactions between independent parties. Also, affiliates offer an opportunity to engage in types of business endeavors that are prohibited to the bank itself yet those endeavors may affect the condition of the bank.

In recognition of the importance of relationships with affiliated organizations, the FDIC has been granted authority, under certain conditions, to examine affiliates in connection with its examination of a bank.

There are two primary definitions of "affiliate" which are of importance to examiners. The first is the definition set forth in Section 2(b) of the Banking Act of 1933. The second is the definition set forth in Section 23A of the Federal Reserve Act.

Affiliates as Defined in Section 23A of the Federal Reserve Act

Section 23A of the FR Act (made applicable to insured nonmember banks by Section 18(j) of the FDI Act) contains the restrictive provisions relating to transactions between banks and their affiliates.

Prior to the GLBA amendments to Sections 23A and 23B, non-bank subsidiaries of banks were not covered by the definition of "affiliate." Those sections now provide that non-bank subsidiaries of state banks are "affiliates" in the event that they qualify as "financial subsidiaries." The GLBA amendments to Sections 23A and 23B apply solely to covered transactions between a state nonmember bank and its "financial subsidiaries" as covered in Section 46 of the FDI Act.

The principal purpose of Section 23A is to safeguard the resources of banks against misuse for the benefit of organizations under common control with the bank. It was designed to prevent a bank from risking too large an amount in affiliated enterprises and to assure that extensions of credit to affiliates are properly collateralized. Section 23A, therefore, regulates loans or extensions of credit to and investments in affiliates of an insured bank in two ways; first, by restricting the amount of such loans or extensions of credit and investments, and second, by requiring that the loans or extensions of credit meet certain standards as to collateral. Four major types of affiliates are defined in Section 23A and these are discussed in the following paragraphs.

Parent Holding Company and Its Subsidiaries

The first type pertains to a parent holding company and its subsidiaries. Any company that controls the bank (holding company) as well as any other company that is controlled by the company controlling the bank (sister subsidiary) is considered to be an affiliate of the bank under Section 23A. "Control" is defined as owning, controlling, or having the power to vote (directly or indirectly) 25 percent or more of any class of voting securities; or controlling in any manner the election of a majority of the directors or trustees. The term "company" means a corporation, partnership, business trust, association, or similar organization. These definitions are very similar, although not identical, to the definitions of "control" and "company" used in the BHC Act. It is therefore possible to have a holding company-subsidiary relationship under the BHC Act that is not an affiliate relationship for the purposes of Section 23A. Control relationships existing in certain types of trusts are an example.

Section 23A grants an important exemption with respect to domestic banks that are affiliated under this definition. When a bank is 80 percent controlled by a holding company, its transactions with other banks which are also 80 percent controlled by the same holding company are largely unrestricted. The only restrictions which do apply are the general prohibitions against a bank purchasing low-quality assets from its affiliates (refer to "Restrictions on Covered Transactions with Affiliates" below for a definition of "low quality asset"), and a requirement that all transactions be consistent with safe and sound banking practices. All restrictions and limitations set forth in Section 23A are, however, applicable to transactions by a bank with its parent holding company, its non-bank subsidiaries, and its bank subsidiaries that do not meet the 80 percent exemption. They also apply to an affiliated foreign bank even where the 80 percent test is met. The rationale for the 80 percent ownership test is that it is the minimum ownership generally required for the preparation of consolidated Federal income tax returns.

Bank Subsidiaries

The second category consists of bank subsidiaries of a bank. A domestic bank, which is controlled by another bank, is an affiliate of the controlling institution for the purposes of Section 23A. Where such bank is, however, 80 percent controlled, it is granted the same exemption described above relative to sister bank affiliates in a holding company organization. Thus, the treatment of domestic bank affiliates is consistent whether the bank is affiliated through a holding company or by virtue of direct ownership or control.

A different situation exists with respect to non-bank and foreign bank subsidiaries. Directly owned subsidiaries of this type, whether majority or minority owned, are excluded from the definition of an affiliate for the purposes of Section 23A. This is in contrast to the treatment of such firms when they are holding company subsidiaries. As noted above, non-bank and foreign bank subsidiaries of a holding company are affiliates and are subject to the restrictions of Section 23A. The rationale for this contrast in treatment is that non-bank subsidiaries, when majority owned by a bank, are really an integral part of the bank and transactions between the two should not normally be restricted. With respect to minority owned nonbank subsidiaries, it is noted that most banks are restricted in their ability to own stock and several of the more common types of nonbank subsidiaries (such as bank premises and safe deposit companies) are specifically exempted anyway. While this rationale serves to mitigate concern for transactions with non-bank subsidiaries in many instances, situations may arise where a bank can be exposed to undue risk. For instance, in some states banks may be able to conduct types of businesses through a non-bank subsidiary that would be prohibited to the bank itself. While the bank's investment in such a company may be limited, there may be no restriction on the amount of loans that could be made to the affiliate to fund its operations. Where evidence exists that a particular non-bank subsidiary should be brought under the restrictions of Section 23A, this can be accomplished by specific order or regulation. Any such recommendation should be forwarded to the Regional Office accompanied by supporting information.

Interlocking Companies

The third category of affiliates may be referred to as companies interlocked with a banking organization. Any company that is interlocked with a bank or its holding company by virtue of common ownership or common directors is an affiliate of the bank for the purposes of

Section 23A. Such interlocks will arise any time that 25 percent or more of a company is owned, directly or indirectly, by or for the benefit of shareholders who have a direct or indirect ownership of 25 percent or more in either the bank or its parent holding company; or a majority of a company's board of directors also comprise a majority of the board of the bank or its parent holding company. This definition may frequently be applicable to chains of one-bank holding companies that are interlocked by ownership or board membership at the holding company level. Under this definition both the chain of holding companies and their subsidiary banks will be affiliates of a bank under examination if either of the above relevant criteria is met.

Sponsored and Advised Affiliates

The final category is comprised of sponsored and advised affiliates. For the purposes of Section 23A, a company that is sponsored and advised on a contractual basis by a bank, or by any of the bank's subsidiaries or affiliates, is an affiliate of the bank. Real estate investment trusts are an example of this type of affiliation.

Any investment company that a bank or any of its subsidiaries or affiliates serves as an investment advisor is an affiliate of the bank. An investment advisor is basically one who, pursuant to a contract, regularly furnishes advice with respect to the desirability of investing in, purchasing or selling securities, or is empowered to determine what securities shall be purchased or sold by the investment company. The rationale for the inclusion of these two types of affiliations is that banks may, in order to protect their reputation or to forestall lawsuits alleging that bad advice was given, engage in less than arms length transactions. By applying the provisions of Section 23A to such situations, a bank's potential exposure to loss can be controlled.

Additional Considerations

In addition to the four categories of affiliates defined above, Section 23A also gives to the Board of Governors of the Federal Reserve System considerable latitude in defining which companies are or are not affiliated. This can be accomplished in three ways:

1. The Board of Governors may determine that "control" exists in individual situations not coming within the control definition of the FR Act after giving notice of and opportunity for a hearing. For example, the FRB may determine that a company owning less than 25 percent of a bank's stock nonetheless exercises control over the bank and is therefore an affiliate.
2. The Board of Governors may also determine that an affiliate relationship exists in specific instances by order or regulation. For instance, the FRB may determine that the relationship between an exempted subsidiary and its parent bank is such that the potential for abusive transactions exists. The FRB may issue an order or regulation bringing transactions with such company under the provisions of Section 23A.
3. The FRB also has the power to issue an order or regulation exempting specific types of transactions or affiliate relationships from the restrictions of Section 23A, provided that it finds that such exemption is in the public interest and consistent with the purposes of the FR Act.

Two final notes relating to the definition of affiliates under Section 23A concern "control" held in a trust capacity and companies acquired for debts previously contracted.

The FR Act specifies that no company shall be deemed to own or control another company by virtue of its ownership of shares in a fiduciary capacity with two exceptions. The first relates to affiliations arising out of the "Interlocking Companies" definition. Under this definition a company is an affiliate under a trust relationship whereby a trustee controls 25 percent or more of the voting shares of a company for the benefit of shareholders who control 25 percent or more of the voting shares of a bank or its holding company. The other exception provides that ownership or control of one company by another through a business trust creates an affiliate relationship.

With respect to the acquisition of control through debts previously contracted, the FR Act specifies that such companies are not affiliates for whatever period of time applicable State or Federal law or regulation permits the bank to hold such shares. In the absence of any such law the holding period is two years from the date of acquisition upon a showing of good cause. After the expiration of the allowable holding periods, such companies are deemed affiliates.

Restrictions on "Covered Transactions" with Affiliates

Section 23A (a)(1) permits a bank to engage in covered transactions with affiliates so long as the covered transactions do not exceed, in the aggregate; (1) 10 percent of the bank's capital stock and surplus with respect to a single affiliate; (The GLBA exempted transactions between banks and their financial subsidiaries from this requirement) and (2) 20 percent of capital and surplus with respect to all affiliates. (For this maximum percentage, the GLBA provides that a bank’s investment in a financial subsidiary will not include the retained earnings of the subsidiary in the calculation). Both the FRB and the FDIC have previously interpreted capital stock and surplus to include undivided profits, capital reserves, the loan valuation reserves, and valuation reserves for securities. The GLBA added a form of “anti-evasion” protection regarding the aggregate transaction limits and collateral requirements in Section 23A and the transaction restrictions in Section 23B. Any purchase of, or investment in, the securities of a “financial subsidiary” of a bank by an affiliate of the bank will be considered a purchase of or investment in such securities by the bank.

Covered transactions are specifically described in Section 23A (b)(7)(A) through (E) but basically consist of:

- Loans to an affiliate,
- Purchase of securities issued by an affiliate,
- Purchase of nonexempt assets from an affiliate,
- Acceptance of securities issued by an affiliated company as collateral for any loan, and
- Issuance of a guarantee, acceptance, or letter of credit on behalf of (for the account of) an affiliate.

Reference is made to Section 23A (d)(2) through (7) for a listing of several types of transactions that are specifically exempted from the provisions of Section 23A. These transactions basically consist of deposit balances in bank affiliates, loans secured by U.S. or agency securities or deposit balances in the bank, readily marketable assets purchased at quoted market prices, loans purchased on a nonrecourse basis from affiliated banks, and the repurchase of loans previously sold to an affiliate with recourse.

The FR Act also contains two other important general provisions that relate to covered and exempted transactions. A bank may not purchase any "low quality asset" from an affiliate in any amount unless, pursuant to an independent credit evaluation, the bank had committed itself to purchase such asset prior to the time such asset was acquired by the affiliate. A "low quality asset" is defined as:

- An asset which was classified as "substandard," "doubtful," or "loss" or treated as "other loans especially mentioned" in the most recent report of examination or inspection of an affiliate prepared by either a State or Federal supervisory agency,
- An asset in a nonaccrual status because of deteriorating credit quality and/or past due status,
- An asset on which principal or interest payments are more than 30 days past due, or
- An asset whose terms have been renegotiated or compromised due to the deteriorating financial condition of the obligor.

This prohibition on the purchase of low quality assets also extends to bank subsidiaries. In other words, neither a bank nor any of its subsidiaries may purchase low quality assets from an affiliate. The other provision is more general but has a similar intent. This provision requires that any covered transaction between a bank and an affiliate must be on terms and conditions that are consistent with safe and sound banking practices.

For purposes of illustration, the following loan purchase transactions provide examples of the application of Section 23A which examiners may find useful.

1. Loans Purchased from Non-Bank Subsidiaries - A bank may purchase any loan, including a classified loan, from its own non-bank subsidiaries since such companies are not considered affiliates under Section 23A. It does not matter whether the subsidiary is minority or majority owned. The only way to control such possibly objectionable activity, other than through use of Section 8 powers, would be to have the nonbank subsidiary brought under the restrictions of 23A by order or regulation.
2. Loans Purchased from Domestic Banks which are 80 Percent Owned by Either the Bank or its Parent Holding Company - A bank may purchase loans in any amount from these affiliates provided they are not "low quality" or constitute "unsound" transactions under the provisions of Section 23A. The loans may be either subject to repurchase by the affiliate or not subject to repurchase.
3. Loans Purchased from Parent Holding Company, Sister Non-Bank Affiliates, Interlocking Non-Bank Affiliates, Sponsored Affiliates and Foreign Bank Affiliates - A bank may purchase good quality loans from these affiliates subject to the 10-20 percent capital stock and surplus limitations. Other covered transactions are aggregated for purposes of applying the amount limitations. Low quality loans or loans whose terms and conditions are unsound may not be purchased in any amount. Loans secured by U.S. securities or repurchased loans which had been sold earlier by the bank to the affiliate on a with-recourse basis are exempted, however, and would be excluded in applying the amount limitations.
4. Loans Purchased from Other Domestic Bank Affiliates - These affiliates are domestic banks controlled by either the bank or its parent holding company but which are less than 80 percent owned. This also includes banks controlled by interlocking affiliates (one-bank holding company chains, for example)

whether more than or less than 80 percent owned. Loan purchase transactions with these affiliates are treated the same as loan transactions with the parent holding company, etc. (#3 above) with one exception; good quality loans may be purchased in any amount provided they are sold by the affiliated bank on a non-recourse basis.

Collateral Requirements

Loans may not be extended directly to an affiliate nor may a bank issue guarantees, acceptances, or letters of credit for the account of an affiliate unless certain collateral and margin requirements are met. Eligible collateral and margins are as follows:

- 100 percent collateral margin if the collateral consists of U.S. Government and agency securities, deposits held in the bank which are specifically segregated and earmarked, or obligations (such as notes, drafts, or acceptances) which are eligible for rediscount or purchase by a Federal Reserve Bank,
- A 110 percent margin is required if the collateral is composed of obligations of a state or political subdivision of a state,
- A 120 percent margin is required if the collateral consists of other types of debt instruments, including receivables, and
- A 130 percent margin is required if the collateral is composed of stocks, leases, or other real or personal property.

It is important to note that market value at the time of the transaction is the appropriate basis for meeting margin requirements in all instances. When any collateral is subsequently retired or amortized and the amount of the remaining collateral does not provide a sufficient margin, additional eligible collateral must be supplied in an amount sufficient to meet the collateral margin required at the inception of the transaction. Where no collateral substitutions or amortizations are involved, a shrinkage in collateral value does not create a violation so long as the margin requirement was met at the inception of the transaction.

As noted above almost any type security is acceptable (provided margin requirements are met) subject to two important limitations. First, low quality assets; as that term is defined, may not be used to meet collateral requirements and, secondly, securities issued by an affiliate of a bank may not be used to secure the obligations of that affiliate or any other affiliate of the bank.

Section 23B of the Federal Reserve Act

Section 23B of the FR Act applies to insured nonmember banks through Section 18(j) of the FDI Act. Violations of Section 23B by nonmember banks are subject to the civil money penalties of subsection (3)(A) of Section 18(j). Section 23B essentially imposes the following four restrictions:

1. A requirement that the terms of affiliate transactions be comparable to terms of similar non-affiliate transactions;
2. A restriction on the extent that a bank may, as a fiduciary, purchase securities and other assets from an affiliate;
3. A restriction on the purchase of securities where an affiliate is the principal underwriter; and
4. A prohibition on agreements and advertising providing or suggesting that a bank is responsible for the obligations of its affiliates.

Section 23B generally incorporates the definitions used in Section 23A; however, banks are not "affiliates" for purposes of Section 23B.

SUBSIDIARIES

A bank subsidiary, as defined by Section 23A of the FR Act, is any company of which 25 percent or more of any class of its voting stock is owned, controlled, or may be voted by the bank; or any company with respect to which the bank controls, in any manner, the election of a majority of its directors or trustees. While several types of subsidiaries (such as bank premises companies or safe deposit companies) have long been excluded from the provisions of Section 23A, post-GLBA, the amendments to 23A and 23B provide that non-bank subsidiaries of state banks are “affiliates” in the event that they qualify as “financial subsidiaries” under new Section 46 of the FDI Act.

The overall condition of a subsidiary can substantially affect the affairs and soundness of a bank. For example, a subsidiary in severe financial distress could precipitate a drain on the management and financial resources of the bank. To determine the overall risk that the functionally regulated entity presents to the insured depository institution as a whole, it is necessary to determine which subsidiaries are functionally regulated within the functional regulation confines (refer to applicable subsection of this chapter).

Requirements for consolidation of subsidiaries are contained in the Call Reports Instructions for essentially all majority-owned bank premises subsidiaries and other majority-owned subsidiaries, which are considered significant according to certain tests, are consolidated. Some major types of subsidiaries are addressed below:

Bank Service Corporation

A bank service corporation is defined in the Bank Service Corporation Act (BSC Act) as a corporation, whose capital stock is all owned by one or more insured banks, organized to perform "authorized services." The BSC Act limits the investment of a bank in a bank service corporation and specifies prior regulatory approval requirements. Authorized services are defined to include services such as: check and deposit sorting and posting, computation and posting of interest and other credits and charges, preparation and mailing of checks, statements, notices, and similar items, or any other clerical, bookkeeping, accounting, statistical, or similar function performed for a bank. In addition, a bank service corporation may perform any services permitted by FR regulation for a bank holding company under Section 4(c) (8) of the BHC Act.

Due to the nature of services performed by these corporations, the importance of analyzing their financial condition is obvious. In addition to authority to examine affiliates the BSC Act provides that for any bank regularly examined by a Federal supervisory agency or any subsidiary or affiliate of such bank subject to examination by that agency, which causes to be performed by contract or otherwise, any bank services for itself, whether on or off premises, such performance shall be subject to regulation and examination by such agency to the same extent as if the services were being performed by the bank itself on its own premises. The bank is also required to notify the appropriate agency of the existence of such a service relationship within 30 days after the making of the service contract or the performance of the service, whichever comes first.

Safe Deposit Corporation

A safe deposit corporation primarily performs the same functions as a safe deposit department of a bank. A primary purpose for establishing such a subsidiary is to limit the bank's liability. These corporations generally are established under applicable State statutes that may contain limits on liability of the corporation for loss to a customer in any box or compartment. The safe deposit corporation should be operated under the same set of internal procedures as a normal bank safe deposit department. Additionally, the subsidiary should be protected by a combination safe depository insurance policy to the extent State law liability limitations do not provide adequate protection.

Corporation Holding Title to Bank Premises

As the name suggests, a bank premises subsidiary holds title to the bank premises and, in most cases leases them back to the bank. Oftentimes construction/acquisition of the bank premises is financed with borrowed money and lease terms are designed to service principal and interest payments of the mortgage. State law for nonmember banks generally limits the maximum investment in a bank premises subsidiary. The amount of investment, direct or indirect, by a bank in bank premises can have a significant effect on overall net earnings. Therefore, it is essential when evaluating a bank's condition and earnings, that majority-owned bank premises subsidiaries be fully consolidated.

Securities Firm

A securities firm subsidiary is a subsidiary that:

- Engages in the sale, distribution or underwriting of stocks, bonds, debentures, notes, or other securities,
- Acts as an investment adviser to any investment company,
- Conducts any activity for which the subsidiary is required to register with the Securities and Exchange Commission as a broker/dealer, or
- Engages in any other securities activity.

Small Business Investment Companies (SBIC)

A SBIC is a company, organized under the Small Business Investment Act of 1958, which provides long-term credit and equity financing for small business concerns. Section 302(b) of that Act authorizes National banks, other member banks, and nonmember insured banks (to the extent permitted by applicable State law), to invest in stock of SBICs not exceeding (in total) 5 percent of the capital and surplus of such banks. In no event may a bank acquire 50 percent or more of the shares of any class of equity securities issued by an SBIC having actual or potential voting rights.

Agricultural Credit Corporation (ACC)

These subsidiaries, established under State law, are generally a means by which a bank can obtain funding to be able to continue to service the borrowing needs of its agricultural customers. The ACC establishes a financing relationship with the Federal Intermediate Credit Bank (FICB) by buying a participation certificate in the FICB. It is then able to borrow a certain percentage of the face value of loans by discounting those loans at the FICB on a full recourse basis. The ACC is examined and regulated by the FICB and any loans classified Doubtful or Loss at the parent bank, which are discounted at the FICB, must be replaced.

Inasmuch as lending limits to ACC's may be separate from and in addition to the bank's limit; care should be taken to avoid a concentration of credit to any individual borrower. Wholly owned ACCs should be examined by the FDIC with classifications reflected in a consolidated balance sheet and analysis of capital.

Special Purpose Finance Subsidiaries

A finance subsidiary is used as a mechanism for raising funds from outside investors through the issuance of collateralized debt or preferred stock. The parent bank places certain assets in the subsidiary to collateralize or otherwise support the securities issued by the subsidiary. Properly used, a finance subsidiary may enhance a bank's efforts to restructure its assets, obtain cheaper and more widely available funding sources, and improve overall profit performance.

Finance subsidiaries can also be used solely for the purpose of generating arbitrage profits rather than for the purpose of obtaining an additional source of funds. For example, a subsidiary might issue collateralized mortgage obligations and use the proceeds to simultaneously buy the mortgage-related collateral that will secure the collateralized mortgage obligation. Thus, the parent bank would receive no additional funds since the proceeds of the securities issuance are used to purchase the underlying collateral.

Bank management has the responsibility to carefully consider the impact of finance subsidiary transactions on the bank's overall financial position. Areas requiring attention include the following:

- Consolidation Requirements. For Reports of Income and Condition filed with the FDIC, subsidiaries that meet any one of the "significance" tests set forth in the Call Report instructions must be consolidated. Thus, securities issued to outside parties by a finance subsidiary that is wholly owned by the parent bank generally would be reported as a liability on the bank's consolidated financial statements.
- Capital Adequacy Considerations. If required to be consolidated with the parent bank for Call Report purposes, these subsidiaries must also be consolidated for purposes of evaluating capital adequacy under the FDIC's Part 325 capital regulation. As a result, finance subsidiary transactions are normally reflected as additional assets and liabilities on the bank's consolidated Report of Condition balance sheet. Because the transactions generally result in an increase in total assets with no increase in capital, the potential negative impact on the capital to asset ratio effectively limits the total dollar volume of such transactions.
- In addition, banks should carefully evaluate their overall asset/liability management, funding, and liquidity management strategies prior to entering into any proposed finance subsidiary transaction. In situations where finance subsidiary transactions are concluded in an unsafe or unsound manner, examiners should seek appropriate supervisory remedies.

Corporations Engaged in International Banking Activities

Edge Act Corporation - A Federally chartered corporation organized under Section 25(a) of the FR Act and subject to Federal Reserve Regulation K. Edge Act Corporations are allowed to engage only in international banking or other financial transactions related to international business. They are chartered and regulated by the Federal Reserve System and must have a minimum capital of $2,000,000 and a minimum life of 20 years. Their purpose is to aid in financing and stimulating foreign trade. An Edge Act subsidiary is a bank's majority-owned Edge Act Corporation and is treated for purposes of Reports of Income and Condition as a "foreign office."

Agreement Corporation

A State-chartered corporation that has agreed to operate as if it were organized under Section 25 of the FR Act and has agreed to be subject to FR Regulation K (refer to the FDIC Rules and Regulations). Banks must apply to the FR for permission to acquire stock in an Agreement Corporation, which is restricted principally to international banking operations.

Foreign Bank Subsidiary of a Limited Purpose Credit Card Bank

The GLBA adds a new provision to the BHC Act, which permits a credit card bank which is not a bank under the BHC Act to control a foreign bank if the investment in the foreign bank meets the requirements of Section 25 or 25A of the FR Act and the foreign bank qualifies under such sections; the activities of the foreign bank are permissible under otherwise applicable law; and the foreign bank does not offer any products or services in the United States.

Mortgage Banking Subsidiaries

Mortgage banking subsidiaries engage in the origination and/or purchase of mortgages for sale in the secondary market and the servicing of mortgages. The major functions of a mortgage banking subsidiary are:

- Origination, which includes application processing, underwriting, and closing,
- Secondary marketing, which includes purchases and sales, warehousing, packaging and shipping, investor relationships, and risk management, and
- Servicing, which includes mortgage accounting administration, collections, customer service, and investor reporting.

Insurance Subsidiaries

There is considerable variety in the laws and regulations of the states. Some allow bank subsidiaries to engage in insurance agency or brokerage operations, while others do not. Some limit the products that may be offered. Types of insurance products include credit liability, casualty, automobile, life, health, accident, title insurance, and private mortgage insurance. The insurance departments of the various states generally regulate insurance activities.

Real Estate Subsidiaries

State laws vary with respect to permissible real estate activities that may be conducted through bank subsidiaries. A number of states permit real estate brokerage activities. Others permit equity participations, which involve passive investment roles, and some states permit bank subsidiaries to engage in real estate development and ownership in an active role. In many cases investments are limited in terms of percentages of an institution's total assets or capital.

Real estate brokerage, management, development and investment are not permitted for national banks or their subsidiaries. For state non-member banks to invest or develop real estate, this activity must be authorized under State law and approved by the FDIC under Section 24 of the FDI Act. Real estate brokerage is considered to be an agency activity, so no FDIC approval is necessary.

EXAMINATION OF SUBSIDIARIES

Unlike affiliates, whose activities may be shielded from the insured institution through the holding company structure and the provisions of Sections 23A and 23B of the FR Act, the liabilities of a subsidiary may flow directly to the insured institution if appropriate barriers between the insured institution and its subsidiaries are not in place. Even with barriers, the legal precedents are such that there is no guaranty that the liabilities of a subsidiary may not adversely impact the parent. Thus, in order to determine the true condition of the parent organization, the risk presented by the subsidiary to the parent institution needs to be evaluated.

If the subsidiary is functionally regulated, the GLBA requires the FDIC to rely to "the fullest extent possible" on the functional regulator. Therefore, examinations conducted by the appropriate Federal and State regulators of functionally regulated entities should be used, if possible, rather than a direct examination of those entities. Examinations of functionally regulated subsidiaries are generally permissible only if:

- There is a reasonable cause to believe that the subsidiary is engaged in activities that pose a material risk to the depository institution,
- That an examination is necessary to assess risk management systems, or
- The subsidiary is not in compliance with a law that the agency has specific jurisdiction to enforce against the subsidiary.

If a high-risk profile is evident, more extensive examination procedures may be required. For a functionally regulated subsidiary, the examiner should contact the Regional Office before proceeding with any direct examination of the subsidiary's records. Any records that the bank maintains, including any written policies and procedures concerning the bank's oversight of the subsidiary, should be reviewed and assessed for adequacy. The objective is for examiners to reach a level of comfort sufficient to assess the overall condition of the subsidiary and its impact on the parent.

The Examination (ED) Modules contain examination procedures for examining subsidiaries. Refer to the Related Organizations section for additional guidance in this area.

Depending on the type of subsidiary, a more in-depth evaluation will generally involve assessment of the following areas:

Asset Quality

The examiner should attempt to ascertain the quality of assets, review delinquency reports where appropriate, and evaluate bank management oversight with respect to the subsidiary and any policies in place to determine the extent of any loss.

Funding and Liquidity

A determination should be made of the types of funding necessary for the subsidiary's activities, the reliability of present funding, and the extent to which the subsidiary's activities are being funded by the bank. An excessive reliance on any one source of funding may indicate future liquidity problems or undue reliance on the parent to provide funding.

Adequacy of Capital

To the extent possible, a determination of the adequacy of the subsidiary's capital should be made after reviewing asset quality, sources of funding, earnings, and management. Capital levels should be compared to regulatory requirements or other standards considered appropriate for the type of business the subsidiary is engaged in. This capital cushion is an important insulation to protect the bank from liabilities of the subsidiary.

In reviewing the parent bank's capital adequacy, the bank's investment in its subsidiary should be deducted from both assets and capital. This analysis will indicate the effect on the parent should the subsidiary become insolvent.

Earnings

The earnings stream of the subsidiary should be reviewed to determine if there is reliance on one time gains or if there is a failure to recognize losses on a timely basis. Fees received from the bank, salary structure and overhead expenses should be reviewed to ensure that charges are in line with those that would be made to third parties.

Management

Daily management of the subsidiary should be structured so as not to create the presumption that the activities of the subsidiaries are in any way conducted by the bank. Advertising and any required disclosures should be reviewed to ensure that the public is not given the perception that subsidiary activities are guaranteed by the bank or insured by the FDIC.

Another important management consideration is “firewalls.” The term "firewalls" is used to describe a concept of separation of responsibility for entities providing different services but which are commonly owned. Firewalls generally include separate corporate formalities, management, employees, accounting, and policies. Also, the operations of the subsidiary should be physically distinct from the operations of the insured institution. Section 362.4(c)(2) of the FDIC Rules and Regulations is an example of a firewall construction designed to insulate the bank from liability of the subsidiary; compliance with Section 362.4(c)(2) should be reviewed where applicable.

EXAMINATION AND INVESTIGATION OF UNAFFILIATED THIRD PARTY SERVICERS

Situations occasionally arise where the safety and soundness of an insured depository institution is materially affected by transactions, contracts or business arrangements with parties that are not affiliated with the institution. When such situations arise, it is necessary for the FDIC to examine the other side of the transaction. The potential impact of these business relationships on the insured depository institution necessitates a complete understanding of the nature of the transaction and relationship and its effect on the insured institution.

By statute, the FDIC has authority to obtain records of unaffiliated service providers and other counterparties relating to an insured financial institution. Such authority is not unqualified but depends on particular facts and circumstances giving rise to inquiries by the FDIC. Several statutory provisions support this conclusion: Sections 10(b) and 10(c) of the FDI Act; Section 7(c) of the BSC Act; and Sections 3(w)(5) and (6) of the FDI Act. The information that the FDIC can obtain from an unaffiliated service provider or other counterparty is not limited to specific transactions with or relating to the insured depository institution but can extend to the financial books and records of the servicer or entity so long as such documents are needed in furtherance of an examination that relates to the affairs of an insured bank.

It is important that examiners are aware of material transactions, service contracts, or other business arrangements that could have a material affect on an insured bank. If it is concluded that information is needed from an unaffiliated service provider or other counterparty to the bank, then the examiner should consult with the Regional Office. The Regional Office will assist the examiner in determining whether information is needed from an unaffiliated service provider, and if so, in obtaining the appropriate information.

Examination authority covering bank service corporations is set out in Section 7 of the BSC Act.

[1] Qualified Thrift Lender test requires that at least 65% of the institution's assets be qualified thrift investments, primarily residential mortgages and related investments.

[2] Generally, an ILC is excepted from the BHC Act if (A) it was chartered under a State law that on March 5, 1987 required the ILC to have Federal deposit insurance, and (B) it meets at least one of the following conditions: (1) the institution does not accept demand deposits, (2) the institution's total assets are less than $100,000,000, or (3) control of the institution has not been acquired after August 10, 1987.

INTRODUCTION

Risk management is intended to minimize the cost associated with certain types of risk and provide prudent protection. The maintenance of appropriate levels of necessary insurance coverage is a key aspect in the risk management process. It deals with pure risks that are characterized by chance occurrence and may only result in a financial loss, as opposed to a speculative risk which affords the opportunity for financial gain or loss. Such pure risks are separated into three major exposure categories: liability, property, and personnel.

There are three stages in the risk management process: risk identification and analysis, risk control, and risk treatment. Identification and analysis requires a review of all aspects of the bank's present and prospective operations to determine where the bank is exposed to loss, including consultation with a reliable insurance professional. Risk control is primarily dependent upon the strength of the bank's internal controls, policies and procedures. Risk treatment refers to choosing the appropriate steps or methods to deal with a particular risk. The objective of this process is to minimize the probability of losses and costs associated with them, such as direct costs of loss prevention measures, insurance premiums, losses sustained, and related administrative expenses. A bank has several options in treating a particular risk. It can implement additional controls to minimize yet retain the risk (i.e. become a self-insurer), transfer the risk to another party through insurance or contractual transfer, or utilize a combination of both of these approaches. A basic tenet of risk management is that those risks which carry the potential for catastrophic or significant loss should not be retained, if avoidable. Conversely, it is not cost justified to insure losses which are relatively predictable and not severe. The board of directors must determine the maximum loss the bank is willing and able to assume, and should perform an annual review of the bank's risk and insurance management program.

The real value of insurance lies in the protection it affords against catastrophic losses. To the extent a bank does not have adequate coverage, losses deplete capital and impair the position of depositors and the FDIC. Examiner review and analysis of the adequacy of the bank's insurance program is clearly necessary. The various types of insurance coverage (delineated below) serve only as a guide and a reference of available insurance protection. The specific needs of a bank must be determined on an individual basis, and only by reviewing each policy in force, can the actual degree of coverage and protection be determined. Any material inadequacies of insurance coverage should be directed to management's attention. Lack of any significant coverage, board of director approval and review, or deficiencies in a bank's loss prevention program should be appropriately commented upon in the Report of Examination.

FIDELITY INSURANCE PROTECTION

Fidelity insurance protection is appropriate for all banks because it insures against certain risks that contain the potential for significant loss. Section 18(e) of the Federal Deposit Insurance Act (FDI Act) provides that the FDIC may require such coverage, and if it is not obtained, may contract for such protection and add the cost to the bank's deposit insurance assessment. However, such action would only be taken in rare instances, such as when a bank is able to obtain protection but refuses to do so.

If the bank is without coverage, a thorough investigation should be made to determine the reasons insurance protection is lacking. Such banks must continue diligent, good faith efforts to obtain reasonably priced coverage. Their efforts should be monitored periodically to confirm the actions being taken to obtain coverage, including steps necessary to satisfy any conditions that may have been imposed by an insurer as a prerequisite for coverage.

In some cases, a bank may offer alternate arrangements in lieu of the usual insurance bond. While it is difficult to generalize, these arrangements (i. e. having directors or owners sign personal guarantees or increasing the bank's capital) do not protect the bank against the same risks in essentially the same manner or to the same extent, and therefore, are generally not acceptable as substitutes for insurance coverage. However, each such offer should be appraised on its merits for whatever additional protection it might provide in the interim.

While a periodic review of internal and external security measures and controls is warranted in every bank, it is especially appropriate in a bank that is operating without fidelity insurance coverage. Ideally, this effort should be undertaken as a special project with responsibility fixed in a particular executive officer. Further, it should include a comprehensive review of the bank's existing programs, the design and implementation of additional security procedures and controls, and a formal report to the board of directors, with any actions taken by the board based on the report findings noted in the minutes of the meeting. Management should also consider using outside experts, as necessary, to assist in strengthening internal programs or possibly to help the bank qualify for fidelity protection where a carrier has previously cited specific deficiencies that require correction.

Providing Examination Information to an Insurance Carrier

Occasionally, a bank may ask to release all or part of an examination report to an insurance carrier. These inquiries should be discouraged. A bank should be able to demonstrate its insurability to prospective insurers without having to release confidential information from an FDIC examination report. Adequate information is available from the bank's records and from nonconfidential sources to enable an insurer to accurately assess its underwriting risk.

Protection From Both External and Internal Hazards

External hazard includes the possibility of dishonest, fraudulent, or criminal acts committed against the bank and its employees by the general public. Robbery, burglary, and forgery are the predominate acts. Banks endeavor to guard against losses from these sources by maintaining vaults and safes, reliable alarm systems, and other security devices which should, at a minimum, meet the requirements set forth in Part 326 of the FDIC's Rules and Regulations. Banks should also attempt to limit the size of such losses by keeping exposed cash and negotiable securities at a minimum.

Internal hazard, which poses a far greater risk, deals with the possibility of defalcations by the bank's own personnel. Banks should try to protect themselves against this hazard by maintaining clear records and effective systems of internal routine and controls. The maintenance of an appropriate level of insurance coverage helps to further limit the institution’s level of risk related to employee defalcations and other types of internal fraud.

Bankers Blanket Bond Insurance

The most common form of blanket bond used by commercial and savings banks is the Financial Institution Bond, Standard Form No. 24. Other forms may be encountered and should be thoroughly analyzed to determine the extent of coverage. Standard Form No. 24 has two different limits of liability--a single loss limit of liability and an aggregate limit of liability. The single loss limit applies to individual claims, whereas the aggregate limit applies to the total of all loss recoverable under the bond. For example, if there is a $500,000 single loss limit and a $1,000,000 aggregate limit, payment of the single loss reduces available coverage for further losses during the bond period to $500,000. When the aggregate limit of liability is exhausted, the bond automatically terminates regardless of the remaining term and without any refund of premium. In order to determine the remaining insurance coverage, the amounts of all prior and pending claims against the bond should be deducted from the stated aggregate limit.

Scope of Blanket Bond Coverage

Clause (A) - Fidelity

Covers losses as a result of dishonest or fraudulent acts by officers and employees, attorneys retained by the bank, and non-employee data processors while performing services for the insured. This clause generally excludes loss caused by a director, unless the director is also a salaried employee of the bank. "Dishonest or fraudulent acts" are defined as acts committed by such employee with the manifest intent to cause the insured to sustain such loss and obtain financial benefit for the employee or another party (other than salaries or other employee benefits earned in the normal course of employment). Coverage of losses resulting from loan activity is severely restricted. Such losses are covered only if the employee involved acts in collusion with another party to the transaction and the employee receives a financial benefit of at least $2,500.

Clause (B) - On Premises

Loss of property (as defined in the bond) resulting directly from (a) robbery, burglary, misplacement, mysterious unexplainable disappearance and damage thereto or destruction thereof, or (b) theft, false pretenses, common law or statutory larceny, committed by a person present in an office or on the premises of the insured, while the property is lodged or deposited within offices or premises located anywhere.

Clause (C) - In Transit

Identical coverage as that provided in Clause (B), except that the property is covered while in transit. The property must be in the custody of a person acting as a messenger of the bank while in transit. When an armored vehicle is not used by a transportation company, property is generally limited to written or electronic records, certified securities, and negotiable instruments.

Clause (D) - Forgery or Alteration

Optional coverage for loss through forgery or alteration of, on, or in checks, drafts, acceptances, and other negotiable instruments, as specified, which are received by the bank either over-the-counter or through clearings. Items received as a transmission through an electronic funds transfer system are not covered.

Clause (E) – Securities

Optional coverage for loss resulting from the insured having, in good faith, for its own account or for the account of others, acquired, sold or delivered, or given value, extended credit or assumed liability, on the faith of any original security, title document or agreement (as delineated in the bond).

Clause (F) - Counterfeit Currency

Covers loss resulting from the receipt by the insured in good faith, of any counterfeit or altered money of the United States or Canada or any foreign country in which the insured maintains a branch office.

Factors to Consider in Determining Adequate Amount of Blanket Bond Insurance

Often, the most difficult insurance problem confronting bank management is determining the amount of blanket bond coverage that should be maintained. While an estimate of money and securities which might be lost through burglary or robbery can be fairly accurately calculated, there are no ready measures for estimating potential losses that may arise from employee dishonesty.

The problem of determining an adequate amount of insurance coverage to indemnify for losses from external hazards is not a complex problem. Property values at risk can be estimated fairly accurately and the level of exposure from daily operations is also generally ascertainable. The various types and amounts of transactions routinely conducted should also be appraised and considered when determining appropriate levels of insurance coverage. For instance, it may be prudent to reduce the insurance coverage for forged securities (within Clause E) taken as collateral for a loan to the amount of the in-house bank lending limit. If that limit is never exceeded, the bank would not suffer a loss greater than that limit on any given transaction.

Determining an adequate amount of fidelity insurance on the bank's own personnel is a more difficult task that cannot be based solely on one precise factor. It requires the use of management and examiner judgment. Banking associations or the insurance industry may periodically develop schedules indicating the range of blanket bond coverage carried by banks grouped by deposit size. However, a bank's level of risk exposure is influenced by many variables, only one of which is deposit size. Therefore, an overall assessment of the effectiveness of the bank's internal operations must be considered. Other factors which may increase fidelity exposure and should be given consideration are: the amount of cash and securities normally held by the bank; the number of employees and their experience level; delegations of authority to employees; personnel turn-over rates; the extent of trust, information technology, or off-balance sheet activities; and whether an institution is experiencing rapidly expanding operations.

When the bank is a member of a holding company or other group of affiliated banks, one fidelity bond is usually purchased to cover the parent and all affiliated banks. In such situations, the examiner should determine that the policy is sufficient to cover the exposures of the subsidiary bank being examined. Further, examiners should also determine that any policy premiums the subsidiary bank pays to the parent holding company are not disproportionate to the bank's benefits from the group policy and that such premiums are consistent with the fair market requirements of Section 23B of the Federal Reserve Act.

Basis for Claims Under the Bankers Blanket Bond

It is standard procedure for insurance companies to write blanket bonds on a “claims made” or "discovery" basis. Under this method, the insurance company is liable up to the full amount of the policy for losses covered by the terms of the bond and discovered while the bond is in force, regardless of the date on which the loss was actually sustained by the bank. This applies even though lower coverage amounts or more restrictive terms might have been in effect on the date the loss was sustained. Alternatively, bonds may be written on a "loss-sustained" basis. This means the bonding company is liable only to the extent of the coverage for losses sustained during the period the bond is in force. Situations which prompt an insurer to write a blanket bond on a loss-sustained basis may arise from another insurer having cancelled or refused to renew a bank's bond (i.e. the insurer is not willing to assume the risk of any undiscovered losses which may have occurred while the bank was insured by another company); the loss record of the bank; poor internal controls; or uncertainty concerning management's abilities.

Blanket bonds require that a loss be reported to the bonding company within 30-days after discovery. Failure to file a report once management is aware of discovery, even if there is uncertainty as to reportability, could jeopardize coverage for that loss. In addition, coverage as to any employee automatically cancels as soon as the bank has knowledge of any dishonest or fraudulent act on the part of an employee. Coverage on such employee can only be assured by written affirmation of the insurer. Likewise, an appropriate written waiver from the insurance company should be in evidence for any individual who has been granted consent to serve as a director, officer or employee pursuant to Section 19 of the FDI Act.

Banks must also notify the underwriter within 30-days of receiving any notice of legal action being brought against it which could result in a claim under the bond. The underwriter may elect, at its option, to defend the insured. If timely notice is not given by the bank or if the underwriter elects not to defend the action, the underwriter is not liable for attorneys' fees and court costs, nor does any judgment against the bank determine the existence of bond coverage.

The general agreements to Standard Form No. 24 make the application for insurance coverage part of the bond. Any misrepresentation, omission, concealment or incorrect statement of material fact in the application may be grounds for recession of the bond. Due to this strong language in favor of bonding companies, banks must be absolutely truthful, accurate and thorough in responding to questions on bond applications and questionnaires. There may be instances when it is appropriate for examiners to review such applications and questionnaires for accuracy and completeness.

Under the present Standard Form No. 24, there are no rights of any parties to make claims under the bond after the termination or cancellation of the bond. Banks may no longer purchase the right to extend the discovery period. It is therefore vitally important for banks to make immediate notification to the underwriter upon discovery of loss covered by the terms of the bond. If there is any uncertainty in this regard, the matter should be investigated promptly to determine whether a loss has in fact occurred that is covered by the terms of the bond. Moreover, the results of any such investigation should be documented as the investigation proceeds. There is immediate termination of the bond upon the taking over of the insured by a receiver or other liquidator or by State or Federal officials. The FDIC is thus effectively barred from pursuing any claims against the bonding company which were not discovered by the bank prior to its closing.

It is critical that the examiner in a potential closing situation call to the attention of the bank's board of directors all known facts concerning any loss discovered during the examination, and the bond requirements that notice be given to the bonding company within 30-days of discovery.

Information Technology (IT) Coverage

IT coverage is provided in the bond for serviced banks under the definition of "employee," which is defined to mean each natural person, partnership, or corporation authorized by the insured to perform services as data processor of checks or other accounting records of the insured. Usually the only riders for IT coverage are those to eliminate it from the policy, which is not advisable. To further protect banks with electronic funds transfer systems (EFTS) and those with in-house computers that contract with outside programmers, additional coverage may be obtained by a rider or separate policy referred to as computer/computer related theft insurance. Usual coverage protects banks from criminal acts affecting data processing equipment, communication lines, data elements and program logic located in one or more of the insured's offices, at contract service bureaus (including financial institutions), and at automated clearing houses, switches or other electronic communications systems. For more detailed coverage of IT insurance, refer to the FFIEC IT Examination Handbook.

Blanket Bond Riders

Numerous riders are available to delete or supplement coverage for risks not included in the basic blanket bond. In some instances, a separate policy may be obtained. While not necessarily all inclusive, a list of common riders purchased by financial institutions is detailed below. All riders should be carefully reviewed since additions and deletions to the basic policy can have a significant impact on overall coverage.

Deductible and Self-Insurance Riders

Banks and insurance companies frequently use deductible clauses to customize the blanket bond coverage to a particular bank. The deductible amount generally ranges from $1,000 to $100,000, or higher, and is directly related to the willingness and ability of the bank to absorb risks. A bank with a history of few claims may choose to lower its premium costs by requesting a higher deductible on its blanket bond policy. On the other hand, a bank with a history of numerous losses may be required to utilize a deductible clause as a condition for continued blanket bond coverage. The use of deductibles obviously lowers the cost of insurance.

Automated Teller Machine Riders

Covers loss involving automated mechanical devices for disbursing money, accepting deposits, cashing checks or making credit card loans when such devices are not located within an office of the insured, and not permanently staffed with a bank teller.

Kidnapping, Ransom and Extortion Rider

Covers losses arising from any of the various forms of extortion whereby the physical well-being of a person(s) is or is believed to be imperiled.

Computer Systems Rider

Covers losses resulting from the fraudulent entry of data or from the change of data or programs within a computer system.

Excess Employee Fidelity Coverage

The purpose of such coverage is to extend the basic protection provided under the blanket bond in areas where the dollar volume of assets or exposure is particularly high. Such excess coverage usually is written in multiples of $1 million and either carries a deductible clause equal to the amount of the blanket bond (usually requires primary bond coverage of at least $250,000), or states that coverage will be provided for the full amount of the excess policy when losses exceed a specified amount. Any deductible in excess of underlying primary coverage should be discussed with management. The most common form of this coverage is the Excess Bank Employee Dishonesty Blanket Bond, Standard Form No. 28. The FDIC strongly recommends that all banks acquire this modest cost protection against the possibility of catastrophic fidelity losses, unless the primary blanket bond coverage is large enough to equal or exceed the protection provided by an excess fidelity bond.

Other Specialized Bank Insurance

This is not a comprehensive list of coverage available, but rather those frequently purchased.

Combination Safe Depository

Consists of two coverage sections that can be purchased together or separately. Clause (A) covers losses when the bank is legally obligated to pay for loss (including damage or destruction) of a customer's property held in safe deposit boxes. Clause (B) covers loss, damage, or destruction of property in customer's safe deposit boxes, whether or not the bank is legally liable, when such loss results from other than employee dishonesty. The policy commonly provides for reimbursement of legal fees in conjunction with defending suits involving alleged loss of property from safe deposit boxes.

Registered Mail and Express Insurance

Insures valuable property such as money or securities shipped by registered mail, registered air mail, express, and air express. Coverage is provided from the time the property leaves the bank until delivered to the addressee.

Transit Cash Letter Insurance

Covers loss of cash letter items in transit for collection or to a clearing house of which the insured bank is a member. It also includes costs for reproducing cash letter items. Generally, such policies do not cover items sent by registered mail or air express, or losses due to dishonest acts of employees.

Valuable Papers and Destruction of Records Policy

Covers the cost of reproducing records damaged or destroyed. It also provides the cost of research needed to develop the facts required to replace books of accounts and records.

OTHER DESIRABLE INSURANCE COVERAGE

The banking industry customarily utilizes forms of insurance for which the blanket bond, along with related policies, endorsements and special coverage previously noted, does not provide coverage or provides insufficient protection. Banks may also need many of the same types of insurance required by any business or individual. The following is a brief description of some of those types of coverage.

Liability Insurance

Directors and Officers Liability

These policies provide for the indemnification of directors and officers against legal and other expenses incurred in defending lawsuits brought against them by reason of the performance of their official duties. They protect, under two insuring clauses, against the expense of defending suits alleging director or officer misconduct and against damages that may be awarded. Clause (A) provides coverage directly to the directors and officers for loss resulting from claims made against them for their wrongful acts. Clause (B) reimburses a corporation for its loss when the corporation indemnifies its directors and officers for claims against them. An additional, optional coverage provides protection for the corporation and its own liability. This coverage is written at a minimum of $1 million (deductible $10,000 to $20,000) with the insurance company paying a portion of any claim over the deductible amount. This insurance does not cover criminal or dishonest acts, situations when the involved person obtained personal gain, or when a conflict of interest was apparent.

General Liability

Covers the bank from possible losses arising from a variety of occurrences. Typically, general liability insurance provides coverage against specified hazards, such as personal injury, medical payments, property damage, or other specific risks that may result in or create exposure to a suit for damages against the bank. Where offered, "comprehensive" general liability insurance covers all risks, except specific exclusions.

Automobile Liability and Physical Property Damage

Protects against property and liability losses arising from injury or death when a bank-owned, rented, or repossessed vehicle is involved. Non-ownership liability insurance should be considered if officers or employees use their own vehicles for bank business.

Umbrella Liability

Provides excess coverage over and above existing liability policies, as well as basic coverage for most known risks not covered by existing liability insurance.

Fixed Assets/Property Physical Damage

Adequate insurance should be maintained to cover loss or damage of the bank's fixed assets.

Fire or Extended Coverage

This insurance covers all loss as a direct result of a fire, including damage from smoke or water and chemicals used to extinguish the fire. Covering the building's contents for fire damage is additional, but often is written in combination with the policy on the building and permanent fixtures. Extended coverage indemnifies against losses from windstorm, hail, explosion, riot, civil commotion, aircraft, vehicles, and smoke damage. Damage caused by rising water or the malfunction of a steam boiler is usually not included. Most fire insurance policies contain "coinsurance" clauses, meaning insurance coverage must be maintained at a fixed proportion of the replacement value of the building. If a bank fails to maintain the required relationship of protection, all losses will be reimbursed at the lower ratio of the amount of the insurance carried to the amount required, applied to the actual value of the building at the time of the loss. When determining insurable value for fire insurance purposes, the typical base is the cost of replacing the property with a similar kind or quality at the time of loss.

Boiler and Machinery

Provides coverage for loss due to explosion or other forms of destruction of boilers, heating and/or cooling systems, and similar types of electrical equipment.

Fine Arts

Includes coverage for art objects on display whether owned by the bank or on loan from another source. Protection generally is all-risk and requires that an appraisal of the material be made regularly to establish its insurable value.

Extra Expense

Provides funds for the additional costs of reestablishing the bank's operations after fire or other catastrophe such as renting temporary quarters and/or equipment on an interim basis.

Business Interruption

Provides reimbursement for the gross earnings lost when the bank cannot operate because of fire or other catastrophe, often with a coinsurance clause.

Rental Income

Provides protection when a fire or other hazard renders the insured premises unfit for occupancy and a lessee ceases to pay rent. The policy will pay the building owner an amount equal to the reasonable rental income immediately before the loss, less any avoidable expenses.

Bank Owned/Leased Automobile

Standard coverage for accidental loss sustained through collision involving a bank automobile. Comprehensive coverage also is available for damage to an automobile other than through collision.

Lending Activities

Various types of insurance are available to cover certain risks in lending activities dependent upon what management considers necessary and warranted for the bank.

Mortgage Lending Activity

Mortgage Errors and Omissions

Protects the bank from loss when fire or all-risk insurance on real property held as collateral inadvertently has not been obtained or has expired. Generally, this insurance is not intended to overcome errors in judgment, such as inadequate coverage or insolvency of an original insurer.

Title Insurance

Insures marketability of title, access to the property, validity and enforcement of the mortgage and, subject to the stated exceptions, its priority. The policy also insures that the person to whom the bank is making the loan has title to the real estate pledged as security. Commitments for insurance are issued in advance of closing, outlining the scope of the coverage, stating the specific exceptions from coverage and the standard exceptions.

Mortgagor's Defaults

Contract with a third-party mortgage insurer to absorb all or part of the risk that the value of the mortgaged property will not cover the loan and costs. Government agencies (Federal Housing Administration {FHA} and Veterans Affairs {VA}) and private insurers provide mortgage protection coverage. This insurance is attractive to lenders who intend to sell mortgages in the secondary market.

Installment Lending Activity

Single Interest

This insurance covers losses to uninsured vehicles pledged as collateral for an extension of credit.

Nonfiling Insurance

Covers losses resulting from nonfiling of liens or recording appropriate instruments on personal property pledged as collateral under chattel mortgages, conditional sales contracts and other similar instruments.

Credit Life, Accident and Health

These types of insurance are written in conjunction with an extension of credit, especially an installment loan, and are designed to protect the bank against loss in the event of a debtor's inability to pay because of sickness, accident or death.

Fraudulent Accounts Receivable and Fraudulent Warehouse Receipts

Cover losses resulting from the pledging of fraudulent or nonexistent accounts receivable and warehouse receipts, or from situations in which the pledger does not have title. In addition, this insurance offers protection against loss arising from diversion of proceeds through acts of dishonesty.

Personnel Administration

Depending on the needs of an individual bank, there are various types of coverage that can be obtained to benefit employees or cover the loss of an employee.

Key Person Insurance

Insurance purchased for the benefit of the bank on the life of an officer when the death of such "key person" would be of such consequences as to affect the operation of the bank. The term "key person" is defined to mean any bank officer, regardless of title, who participates in major policy making functions of the bank and whose loss to the bank would be of consequence because of knowledge, experience and related qualifications. Many "key person" insurance programs are designed to provide a fringe benefit to the insured officer and family. The benefit accrues to the officer when, upon death, the board of directors of the bank directs payment of the proceeds to the officer's family.

Employee Benefit Insurance

An employee benefit program, to be effective, must be able to respond to the changing needs of employees; be competitive with other firms in the trade area who employ individuals similarly qualified to those employed by the bank; be of reasonable overall cost; and compare favorably to peer group statistics. Some insurance coverage is legally required, such as unemployment insurance, worker's compensation, and Social Security. Other commonly provided insurance policies are group insurance protection for life, health, accident, medical, hospitalization, vision, and dental. Other programs such as deferred compensation and salary continuance have been developed which provide additional fringe benefits to key officers and/or their designated beneficiaries. The premiums for such insurance are paid either in part or entirely by the bank, with the bank having no beneficial interest in the policy.

INTRODUCTION

Financial institutions operate within a regulatory framework based on state and federal statutes, regulations, and administrative rulings. These laws and regulations are designed to protect the public (depositors, consumers, investors, creditors, etc.) by establishing operational standards and consumer protections for the banking industry. Violations of laws and regulations can reflect negatively on a bank's board of directors and management and can expose an institution to financial and other risks. Accordingly, examiners must have a thorough knowledge of state and federal laws and regulations to ensure that violations are promptly detected and corrected.

Causes

Violations often result from management's unfamiliarity with, or misinterpretation of, governing statutes or regulations. Negligence and willful noncompliance may also lead to violations. To reduce the risk of violations, the board of directors and senior management should develop:

- Policies, procedures, and training programs designed to ensure that directors, officers, and employees are familiar with applicable laws and regulations;
- Monitoring procedures to assure compliance with laws and regulations in daily operations; and
- Procedures for detecting noncompliance, reporting it to the board and management, and correcting identified issues promptly.

Differences of opinion can arise regarding the interpretation of laws and regulations. If management disagrees with the applicability or meaning of a statute or regulation and examiners are in doubt as to its applicability or meaning, the examiners may consult with the regional office to confirm the applicability or meaning.

Willful acts of noncompliance with laws or regulations should be taken seriously and thoroughly investigated by examiners. Depending on the gravity of an offense and other factors, willful noncompliance may result in civil money penalties (CMPs), or other administrative actions under Section 8 of the Federal Deposit Insurance Act (FDI Act).

Significance

The fair and non-discriminatory treatment of stakeholders and customers should be sufficient reason for bankers to operate in accordance with laws and regulations. Bank directors and officers should be aware, however, that there are also more direct and personal reasons to conform to laws and regulations. Federal statutes and regulations (and those of some states) provide for the assessment of civil money penalties against banks and individuals for certain violations. Additionally, most state laws provide that directors can be held personally liable for a bank's losses relating to illegal loans or other nonconforming assets (assets acquired or held by the bank in violation of a law or regulation). Such losses may also prompt requests for restitution or other corrective measures. Finally, infractions of laws and regulations may prompt litigation and requests for money damages by adversely affected parties.

←

SCHEDULING VIOLATIONS

Examiners should cite apparent violations on the Violations of Laws and Regulations schedule of the Report of Examination (ROE). Nonconformance with interagency guidelines that are incorporated into regulations (such as Appendix A or B of Part 364, or Appendix A of Part 365 of the FDIC Rules and Regulations) should be segregated under an appropriate subheading, listed after cited apparent violations, and include information similar to apparent violations. Detailing infractions on one schedule allows examiners to present issues to bank officials more effectively and allows readers to evaluate the type and severity of apparent violations more easily. Comments should include:

- Clear, concise headings for each violation or group of related violations;
- Descriptions of each applicable statute or regulation;
- Details of the action or inaction that caused an apparent violation;
- Names and dates of directors' approvals/dissentions;
- Management's response; and
- Commitment/timing of any promised corrective action.

When describing a law or regulation in the ROE, examiners should cite the specific section number and either quote or paraphrase the law or regulation. In controversial situations, examiners should generally quote applicable sections. In non-controversial situations, examiners may paraphrase regulations, but must ensure descriptions accurately convey a statute or regulation's main point. For example, "Section 337.3(b) prohibits banks from making large loans to directors without prior board approval."

Examiners must be accurate when describing the action or inaction that caused an apparent violation; however, it is generally unnecessary to provide lengthy explanations. For example, an infraction of Section 337.3(b) could be described as, "The $3 million loan to Director Smith funded on 12/2/18 is in apparent violation of Part 337 because it was extended without prior board approval."

Examiners may avoid lengthy descriptions of violations relating to classified assets by referencing write-ups included in other ROE schedules, such as the Items Subject to Adverse Classification.

To reflect director responsibility and possible liability, report comments must identify the directors who approved or ratified the apparently unlawful actions, the date of the approvals, and the names of any dissenting directors. Examiners should follow these procedures even if an approval consisted merely of the ratification of a group of loans, possibly identified only by numbers.

General Considerations

- Use the phrase *apparent violation* to describe infractions directly related to laws and regulations, no matter how certain the violation may appear.
- List violations in order of importance, considering the substance and severity of the violation.
- Exercise care when citing apparent violations because incorrectly cited infractions discredit the ROE.
- State if an apparent violation was corrected during the examination.
- Generally, include sample lists when violations involve numerous accounts or credits. (Detail the total number of accounts or credits in the ROE, give complete lists to management, and retain a copy of the list in the workpapers.)
- Cite the specific section or subsection of a regulation, such as Section 337.3 or Section 337.3(b), when referring to specific regulations.
- Cite a regulation's part number, such as Part 337, when referring to general regulations.

The considerations above apply similarly to citations of nonconformance with guidelines incorporated into an appendix to a regulation. Key differences being:

- Use the term *nonconformance* to describe significant deficiencies in adherence to the guidelines contained in appendices to regulations, such as the appendices to Part 364 or 365.
- List nonconformance with such guidelines after apparent violation citations and under the separate heading *Nonconformance with Guidelines Incorporated into Appendices to Regulations*.

Uncorrectable Violations

Examiners should not continue to cite previously cited violations that cannot be corrected. For example, violations of the prior approval requirements of Regulation O are not correctable and should not be cited at subsequent examinations. However, examiners should cite repeat violations (new infractions of previously cited violations), and continuing violations (violations that could have been, but were not, corrected).

Report Comments

If apparent violations of law or regulation, or nonconformance with an appendix to a regulation, are cited in the ROE, the Examination Conclusions and Comments (ECC) page must include, at a minimum, a brief summary comment and reference to the Violations of Laws and Regulations page. References to other report pages may also be necessary if related issues, such as internal control or policy weaknesses, are detailed elsewhere in the ROE.

Examiners should not refer to the FDIC's authority to impose CMPs, or to the possible amount of CMPs that may be imposed, except in serious situations. Examiners can comment that violations may be subject to CMPs if violations cited at previous examinations are repeated or not corrected.

Note: When an examiner concludes that violations detected during the examination warrant a CMP recommendation to the regional office, the home mailing addresses of all directors and any other individuals involved in the violation should be included in the Directors/Trustees and Officers section of the ROE.

←

TYPES OF VIOLATIONS

The following sections describe common violations detected in safety and soundness examinations. Most examples relate to nonconforming assets.

Legal Lending Limit Violations

A borrower's debt at a bank may consist of several notes of different dates. When the total of such notes exceeds state or federal lending limits, courts have generally held that only the note(s) that created the excess above the lending limit constitutes an illegal extension. Until the note(s) are paid in full, they represent a violation for which the approving directors may be held liable. Generally, examiners should cite only the note(s) that caused the apparent violation. However, if state law or practice differs from this guidance, state law prevails.

Courts have also held that if several notes constitute a single transaction, all notes should be treated as a unit and the entire loan balance considered an illegal extension for which the approving directors may be held liable.

Note: Loans are sometimes made in conformance with statutory lending limits, but subsequently exceed lending limits due to a decline in capital levels or appraised values. Examiners should not cite violations in these situations unless indicated by state law. However, violations should be cited if the loans were renewed at levels exceeding lending limits.

Nonconforming Loans to Insiders

Bank directors and officers have responsibilities to stockholders and depositors. Their actions must be conducted in good faith and free from self-dealing or conflicts of interest. Loans to directors, officers, employees, principal shareholders, and their interests must be beyond reproach, and illegal loans must be reported and corrected as soon as possible.

Nonconforming extensions of credit to insiders and their interests may violate state laws, Federal Reserve Board Regulation O, or Section 337.3 of the FDIC Rules and Regulations. These statutes limit the dollar amount of loans banks may extend to insiders, prohibit banks from making insider loans on preferential terms or conditions, and establish recordkeeping requirements.

Nonconforming Affiliate Transactions

Sections 23A and 23B of the Federal Reserve Act govern transactions between member banks and their affiliates. Section 18(j) of the FDI Act makes Sections 23A and 23B applicable to state nonmember banks.

All infractions of Sections 23A and 23B, including nonconforming extensions of credit to, and illegal investments in, an affiliate should be cited as apparent violations.

Nonconforming Real Estate Loans

Various laws and regulations govern the extension of loans to purchase, or secured by, real estate. For example, Part 365 of the FDIC Rules and Regulations requires institutions to develop written policies that establish appropriate limits and standards for real estate related loans. Part 323 requires institutions to obtain appraisals from qualified appraisers for various real estate related financial transactions.

Generally, examiners should list the current book value of nonconforming loans if they identify violations of these or other real estate related regulations. In cases where violations involve multiple loans, only the loan(s) that created the violation should be cited.

Nonconforming Securities Securing Loans

Various statutes and regulations govern the process of collateralizing loans with securities. For example, Federal Reserve Board Regulation U restricts loans made for buying margin stock if the loans are collateralized by margin stock. Section 23A of the Federal Reserve Act prohibits banks, with certain exemptions, from securing loans to an affiliate using any affiliate's stock as collateral. Also, Treasury Department regulations prohibit the pledging of certain savings bonds as loan collateral. Where ineligible bonds are designated as collateral, examiners should not recognize the loan as secured. However, the loan itself may not be a violation and should not be included in this schedule unless collateral is required, or it is otherwise nonconforming. For example, it lacks a financial statement required by a state law for unsecured loans.

Loans collateralized in apparent violation of law or regulation should be cited at the current balance of the loans.

Securities Unlawfully Acquired or Held

Part 362 of the FDIC Rules and Regulations and many state laws restrict banks from investing in certain types of securities. For example, banks may be prohibited from acquiring common stock or other forms of equity investments. Exceptions are sometimes allowed for investments in subsidiaries holding title to bank premises, stock in bank service corporations, or securities taken in consideration of debt previously contracted (DPC). If a bank appears to have unlawfully acquired or held a security, examiners should contact the regional office and when appropriate cite the current book value as an apparent violation in the ROE.

Nonconforming Other Real Estate

State laws sometimes require banks to divest of, within defined periods, real estate acquired through foreclosure, repossession, or otherwise in satisfaction of DPC. Examiners do not need to cite violations for real estate acquired DPC and held longer than permitted by statute if the asset is carried on the books at a nominal value. However, real estate acquired illegally (as distinguished from real estate acquired DPC), should be cited as an apparent violation even if fully charged off.

Charged-Off Nonconforming Assets

Illegally held or acquired assets are violations regardless of any related charge-offs. For example, if a bank makes a loan that exceeds legal lending limits and subsequently charges off all or part of the debt, the borrower remains liable for the unpaid loan balance and the loan remains a violation at the original amount. Were this interpretation not in place, bank management, desiring to accommodate a borrower beyond the legal limit, could make excessive loans and simply charge them down to the legal limit or eliminate them from their financial records. The same general rule holds true regarding most other types of nonconforming assets.

All Other Violations

Some violations of laws and regulations are not associated with the acquisition or holding of a nonconforming asset. They include most apparent violations of the FDI Act, FDIC Rules and Regulations, Bank Holding Company Act, and other similar federal and state laws and regulations.

However, some of these apparent violations are not scheduled in the safety and soundness ROE. For example, apparent infractions of the federal criminal code are reported separately, and infractions of the Truth in Lending Act and Equal Credit Opportunity Act are excluded since they are covered in separate consumer compliance ROEs.

Nonconformance with Guidelines Incorporated into Regulations

Nonconformance with guidelines or standards that are incorporated into regulations (such as Appendix A or B of Part 364, or Appendix A of Part 365 of the FDIC Rules and Regulations) should be scheduled in the Violations of Laws and Regulations page, under a separate heading and after apparent violations of laws and regulations. Related supervisory recommendations should be summarized on the ECC page and should include at a minimum, a brief summary comment, and reference to the Violations of Laws and Regulations page, and other pages when applicable. When appropriate, the concerns should be brought forward to the Matters Requiring Board Attention schedule.

←

EVALUATION OF MANAGEMENT

Examiners must consider a bank's adherence to laws, regulations, and internal policies when assigning Management and composite ratings. Compliance with statutory and regulatory provisions is more likely achieved when the board of directors and senior management recognize the importance of legally conforming behavior and maintain appropriate internal guidance. The board should establish policies, procedures, and controls designed to ensure compliance with legal and regulatory directives, prompt detection of noncompliance, timely implementation of corrective measures, and adequate training of officers and employees to prevent infractions. Deficiencies in these areas reflect negatively on management and should be appropriately recognized.

For example, regular or willful noncompliance reflects more negatively on management than a minor infraction of a technically complex statute, and examiners should tailor comments and recommendations to match the severity of all infractions of laws and regulations. However, regardless of their perceived importance, it is important that management promptly correct all apparent violations.

REMOTE DISBURSEMENT ACTIVITIES AND ZERO-BALANCE ACCOUNTS

In an effort to establish and/or maintain customer relationships, banks often provide cash management services to corporate accounts. Two of the more common services are remote disbursement services and zero-balance accounts. Remote disbursement is a technique that enables a customer to delay settlement of a financial transaction by taking advantage of the "float" possibilities in the check clearing system. The process occurs when the maker of a check draws the instrument payable at a bank remotely located ("remote bank") from the payee named in the instrument. Remote disbursement is often used in conjunction with zero-balance accounts that permit depositors to draw checks against accounts maintained at or near a zero-balance. A corporate customer utilizing this cash management approach generally maintains a primary deposit account relationship at a bank where the principal borrowing arrangements are maintained. This bank may be referred to as a "concentration bank" and through it the customer consolidates receipts and makes general disbursements.

Zero-balance accounts obviously cannot be considered funding sources for the remote bank. More importantly, they present a credit risk due to the fact that checks are paid on accounts with insufficient collected balances on the expectation that covering funds will be provided by the customer prior to the close of the business day. The intraday exposure to the remote bank, in the form of unsecured lending against uncollected funds, is not reflected in the bank's financial statement. However, the amounts involved may be sizeable and even exceed the bank's capital.

Examiners should analyze the bank's cash management services. If a concentration bank is involved, the focus should be on the potential volatility presented by using corporate deposits as funding sources. If a remote bank is involved, the supervisory interest centers on the exposure resulting from the practice of routinely paying checks against uncollected funds. The absence of prudent safeguards and full knowledge of the creditworthiness of the customer may expose the remote bank to large and unnecessary risks and warrants comment in the examination report and the initiation of remedial measures.

FUNDS TRANSFER SYSTEM RISK

Growth of the commercial banking industry, accompanied by greater customer demand for services, has increased the importance of wire transfer activity. Wire transfer has evolved from the use of elementary Morse code to sophisticated automated switching operations linking the Federal Reserve System with various governmental agencies and commercial banks. Functions of the wire transfer operation include daily funds transfers, securities transactions and the general communication of information.

Banks may effect transfers or related messages by mail, telephone and direct access to several telecommunications systems. The size and complexity of the operation will determine which method the bank uses. Since speed is the primary reason for many wire transfers, mail requests are infrequent. The majority of banks make transfers and execute Federal funds transactions over the telephone or teletype since their size and volume does not justify maintaining automated systems. However, the tendency to automate the operation is increasing with the advent of inexpensive computer technology.

The large-dollar networks are now an integral part of the payments and clearing mechanism. A variety of networks have been established to provide funds transfer services. They include the Federal Reserve Communications System (FedWire), the Clearing House Payments System (CHIPS) and Automated Clearing House (ACH).

The volume of funds which change hands daily in the U.S. through the electronic funds transfer environment is staggering. Present estimates place this volume at over one trillion dollars. It is therefore readily apparent why the financial institutions involved in those transactions and the regulatory authorities who supervise them are concerned with the quality of internal controls and management's awareness of the inherent risks associated with the various systems.

Risk Management

Errors and omissions and fraudulent alteration of the amount or account number to which funds are to be deposited could result in a loss to the bank. Costs can include loss of funds, loss of availability of funds, interest charges, and administrative expenses associated with recovering funds and correcting problems.

Banks are exposed to settlement risk whenever provisional funds are transferred. Provisional funds are irrevocable payments that are subject to final settlement at a later time. Two levels of risk are present:

- Credit risk to participating banks whose overdraft payments for customers (including nonsettling respondents) are not covered.

- Systemic risk to network participants when other participants fail to settle. There is no settlement risk to the recipient of a FedWire transfer. However, payments received through CHIPS are provisional and expose the recipients to settlement risk if funds are released prior to final settlement.

Intraday (or daylight) overdraft risk occurs when payments are released in expectation of the future receipt of covering funds. By definition, they represent credit exposures of a very short duration, usually a few hours. Overnight overdrafts result from failure to receive covering funds or intentional extensions of credit. In either case, a bank is exposed to risks resulting from payments made against insufficient funds or credit extensions.

The examination of funds transfer activities is designed to disclose deficiencies in the internal credit and operational controls of participating institutions and to assess the adequacy of the supervision of such activities by senior management and the boards of directors of those institutions.

Management is responsible for assessing the inherent risks in the system, establishing policies and controls to protect the institution against unreasonable exposures, and monitoring the effectiveness of such safeguards. Bank supervisors have the responsibility to ensure that the financial institutions have evaluated their own risks realistically and have provided for accounting records and internal controls which are adequate to keep the exposures within acceptable limits.

Effective risk management requires that:

- An adequate accounting system be in place to determine the extent of any intraday overdrafts and potential overnight overdrafts before releasing payments;
- Payments be within established credit limits and amounts in excess of such limits involving significant credit risk be properly approved by appropriate lending authorities; and
- Institutions responsible for settling the positions of others assign responsibility for monitoring respondents' accounts at an appropriate supervisory level.

To assure that prudent practices are being followed by banking institutions in their funds transfer activities, examinations should focus, with equal emphasis, on the evaluation of credit risks and operational controls. Deficiencies disclosed in either of these areas and suggestions for improvement should be discussed with management and listed in the Report of Examination. Constructive criticism by the examiners should help the institutions strengthen procedures to minimize the risks associated with funds transfer activities. Refer to the Electronic Funds Transfer (EFT) Examination Documentation module for further guidance.

INTRODUCTION

From a bank regulator's standpoint, the essential purpose of bank earnings, both current and accumulated, is to absorb losses and augment capital. Earnings is the initial safeguard against the risks of engaging in the banking business, and represents the first line of defense against capital depletion resulting from shrinkage in asset value. Earnings performance should also allow the bank to remain competitive by providing the resources required to implement management's strategic initiatives.

The analysis of earnings includes all bank operations and activities. When evaluating earnings, examiners should develop an understanding of the bank's core business activities. Core activities are those operations that are part of a bank's normal or continuing business. Therefore, when earnings are being assessed, examiners should be aware of nonrecurring events or actions that have affected bank earnings performance, positively or negatively, and should adjust earnings on a tax equivalent (TE) basis for comparison purposes. Although the analysis makes adjustments for non-recurring events, examiners should also include within their analysis the impact that these items had on overall earnings performance. Examples of events that may affect earnings include adoption of new accounting standards, extraordinary items, or other actions taken by management that are not considered part of the bank's normal operations such as sales of securities for tax purposes or for some other reason unrelated to active management of the securities portfolio.

The exclusion of nonrecurring events from the analysis allows the examiner to analyze the profitability of core operations without the distortions caused by non-recurring items. By adjusting for these distortions, examiners are better able to compare earnings performance against the bank's past performance and industry norms (e.g., peer group data) over time.

The terms level and trend are used throughout this section of the Manual. Level analysis is the process of reviewing financial statement ratios and volumes as of a specific date. Level analysis allows for a comparison of performance, for example, to industry norms or peer group data. Trend analysis is the process of assessing the general direction or prevailing tendency (i.e., increasing, decreasing, or stable) of operating ratios or volumes over several periods (i.e., generally over a five year period) using the level of each period.

The following tools are available to assist the examiner in the assessment of earnings: the Uniform Bank Performance Report (UBPR), the bank's Consolidated Reports of Condition and Income (Call Report), the bank's financial statements and subsidiary ledgers, analytical reports prepared for the bank's senior management and board of directors, and the Examination Documentation (ED) Modules.

The UBPR can be used to perform level and trend analysis of key earnings components. Bank-prepared analytical reports can serve the same purpose while also revealing those elements of earnings of strategic interest to management. In conjunction with the UBPR and any internal analytical reports, the bank's Call Report and corresponding bank financial statements and supplementary schedules should be used for more in-depth review. The information gleaned from these schedules may provide the examiner considerable insight into bank earnings. An analysis of earnings is not complete until the examiner has a full understanding of the bank's business activities and its strategic initiatives, and has discussed the bank's financial performance and strategies with management

Further, examiners should consider the bank's marketplace when assessing earnings because institutions that operate in more competitive environments must continually adapt to current national, regional, and local economic and industry conditions to remain viable over time. Also, examiners should determine whether there are any secular, cyclical, or seasonal factors that may favorably or unfavorably affect bank earnings. Current knowledge of such conditions and factors can be obtained by reviewing economic and industry information in newspapers and industrial journals.

Earnings Analysis Trail

Generally the analysis of earnings begins with the examiner reviewing each component of the earnings analysis trail. The earnings analysis trail provides a means of isolating each major component of the income statement for individual analysis. The earnings analysis trail consists of the following income statement components: net interest income, noninterest income, noninterest expense, provision for loan and lease losses, and income taxes.

Each component of the earnings analysis trail is initially reviewed in isolation. Typically, ratios are examined to determine a broad level view of the component's performance. The level of progression along the analysis trail will depend on a variety of factors including the level and trend of the ratio(s), changes since the previous examination, and the institution's risk profile.

The balance sheet composition, or structure, is determined by management. Any material shifts in the balance sheet structure will cause changes to any ratios using a numerator or denominator from the balance sheet (e.g., average assets and average earning assets). Therefore, examiners should be aware that significant changes in the balance sheet structure can materially affect earnings performance.

Ratio Analysis

Several key UBPR ratios used in the earnings analysis are shown below. Refer to additional ratios and the UBPR User's Guide as needed.

Net Income to Average Assets Ratio

This ratio is also known as the Return on Assets (ROA) ratio and consists of bottom line after-tax net income, including securities gains/losses and extraordinary items, as a percentage of average assets. The ROA is a common starting point for analyzing earnings because it gives an indication of the return on the bank's overall activities. A typical ROA level is different, depending on the size, location, activities, and risk profile of the bank. For example, a "community" bank with a few branches may regularly achieve an ROA ratio that exceeds those realized by large wholesale banks. Although the ROA provides an overall performance measure, the individual components comprising the ROA need to be reviewed. These sub-components will be discussed later in this section.

Net Income Adjusted Subchapter S to Average Assets Ratio

In general, institutions that elect to operate as Subchapter S (Sub S) corporations are treated as pass-through entities and are not subject to Federal income taxes at the corporate level Therefore, an adjustment to net income is needed to improve the comparability between banks that are taxed at the corporate level and those that are not. Refer to the UBPR User's Guide for specific information.

Various other issues specific to Sub S corporations may also exist. For instance, several states do not recognize Federal Sub S elections. Therefore, Sub S institutions may remain subject to State corporate income taxes. Refer to outstanding guidance for additional information and the potential effects of this election on the institution's overall earnings performance.

Net Interest Income (TE) to Average Assets Ratio

The ratio of Net Interest Income (NII) to Average Assets is also known as the NII ratio and measures annualized total interest income, plus the tax benefit on tax-exempt income, less total interest expense, divided by average assets.

TE adjustments are made to enable meaningful comparisons for banks that have tax-exempt income. These adjustments are discussed in detail in the UBPR User's Guide. Consideration should be given to the impact of tax-free investments and the related adjustment(s) made to the ratio(s) when material.

This ratio typically represents the bank's largest revenue component. While a higher NII ratio is generally favorable, it can also be reflective of a greater degree of risk within the asset base. For example, a high NII ratio could indicate management is making a large number of "high-interest, high-risk" loans (for example, subprime loans). Although an increase in the NII ratio would be evident, this would not necessarily be an improvement.

The NII ratio can be broken down into two sub-component ratios: Interest Income (TE) to Average Assets and Interest Expense to Average Assets. These ratios and their related components can be analyzed to determine the root cause(s) of any changes in the ratio and their subsequent effect on the ROA.

Net Interest Income (TE) to Average Earnings Assets Ratio

This ratio is also known as the Net Interest Margin (NIM). The ratio is comprised of annualized total interest income on a TE basis, less total interest expense, divided by average earnings assets. This ratio indicates how well management employed the earning asset base. The NIM is more useful than the NII for measuring the profitability of the bank's primary activities (buying and selling money) because the denominator focuses strictly on assets that generate income rather than the entire asset base.

The sub-components of the NIM - the ratios of Interest Income to Average Earnings Assets and Interest Expense to Average Earning Assets - can be analyzed to determine the root causes of NIM changes. These ratios may change for a variety of reasons, for example, management may have restructured the balance sheet, the interest rate environment may have changed, or bank loan and deposit pricing became more or less competitive.

Noninterest Income to Average Assets Ratio

This ratio is comprised of annualized income from bank services and sources other than interest-bearing assets, divided by average assets. Level, trend, and overall contribution of noninterest income to earnings performance should be analyzed. If the contribution represents a major portion of the bank's total revenue, specific sources of noninterest income need to be identified. An assessment as to whether or not these sources are core versus nonrecurring should be made.

Noninterest income is largely of a fee nature; service charges on deposits, trust department income, mortgage servicing fees, and certain types of loan and commitment fees. The results of trading operations and a variety of miscellaneous transactions are also included. In some institutions, noninterest income is being relied upon more heavily as banks are attempting to diversify their earnings streams.

Noninterest Expense to Average Assets Ratio

This ratio is also referred to as the Overhead (OH) ratio and is calculated by annualizing expenses related to salaries and employees benefits, expenses of premises and fixed assets, and other noninterest expenses, divided by average assets. Levels and trends of each component should be assessed and the types of expenses representing the largest overhead components should be determined. Examples of the type of costs that may lead to an inordinately high level of overhead expenses include: excessive salaries and bonuses, sizable management fees paid to the bank holding company, and high net occupancy expenses caused by the purchase or construction of a new bank building.

Other related ratios such as average personnel expense per employee, average assets per employee, and the efficiency ratio may provide useful information. The level of these ratios and the overall affect on earnings performance should be analyzed. If significant, specific sources of noninterest expense need to be identified. An assessment as to whether these sources are core versus nonrecurring should be considered during the earnings analysis.

The existence of unwarranted and unjust compensation of bank insiders is of particular concern, especially when those expenses are likely to result in harm to the bank and ultimately the deposit insurance fund. In this regard, the FDIC's safety and soundness standards (Appendix A to Part 364) state that both excessive compensation and compensation that could lead to material financial loss to an institution are prohibited as unsafe and unsound practices. While just and equitable employee and directorate compensation is essential for the acquisition and retention of competent management, there are instances where bank insiders profit from unwarranted compensation. Unwarranted and unjust compensation and related expenses to bank insiders should be dealt with through whatever means are necessary to cease these abuses. This is particularly critical in lower-rated banks. In such banks, the directorate should be reminded of their fiduciary responsibility for the preservation and conservation of bank funds. Additionally, management fees assessed by parent bank holding companies should be considered for appropriateness and level since they may be significant.

Provision for Loan and Lease Losses (PLLL) to Average Assets Ratio

This ratio shows the annualized percentage of PLLL in relation to average assets. Material changes in the volume of PLLL (either positively or negatively) should be investigated. Higher provisions should result if the loan mix changes significantly from loans with lower to higher historical loss experience (e.g., from one-to-four family mortgage loans to commercial loans) or if economic conditions have declined and have produced a deterioration of loan quality. In situations where the economy is improving and loan quality is stabilizing or improving, lower PLLLs may be appropriate.

When assessing the PLLL, examiners need to determine whether the level of the ALLL is appropriate to absorb estimated credit losses inherent in the loan and lease portfolio. An ALLL that is not at an appropriate level may be due to any one or a combination of reasons. For example, an ALLL that is below an appropriate level may be caused by a decline in loan quality identified during the examination, an inaccurate ALLL methodology, or an attempt by management to manipulate earnings. If the ALLL is deemed to be materially insufficient during the examination, management will be required to take an additional PLLL to bring the ALLL to an appropriate level, thereby increasing the bank's expenses and adversely affecting earnings. Earnings ratios affected by this charge to the PLLL should be adjusted and reflected in the earnings analysis..

Refer to the Loans section of this manual and the Call Report Instructions for additional information on the ALLL.

Realized Gains/Losses on Securities to Average Assets Ratio(s)

The ratio of securities gains/losses to average assets shows the annualized percentage of net realized gains or losses on available-for-sale and held-to-maturity securities in relation to average assets. The level, trend, and overall contribution that securities transactions have on earnings performance should be analyzed.

Bank management may purchase and sell securities for many reasons, but most banks limit investment activity to ensure adequate liquidity is available to meet unanticipated funding needs and to invest excess funds (i.e., when loan demand is low). Examiners should determine whether management actively engages in the sale of securities. When management actively manages their portfolio, this securities activity should be considered part of the bank's core operations. Examiners should assess management's strategies and their implementation. For example, examiners should be alert for instances where investments with unrealized gains are sold while those with unrealized losses are held and should ascertain the reasons for these transactions. Examiners should consider these types of instances when assessing earnings prospects.

While actively selling securities may not be part of a bank's core operations, there are many reasons why management may sell securities. Among the reasons for which management may sell securities that would not be part of a bank's normal operations would be when management needs to restructure the portfolio to maintain or change portfolio duration, to maintain or change portfolio diversification, or to take advantage of some tax implications or some other combination of these reasons. When not part of a bank's core operations, examiners should eliminate the gains or losses adjusted for taxes so as to not distort core operating results. The elimination of these gains or losses allows for level and trend analysis of core operations.

.

Other Considerations

Income Taxes

It is important to judge whether applicable income taxes, that is, the provision for taxes, seems appropriate and whether a shift in the effective tax rate has occurred. In determining the appropriateness of income taxes, several tax ratios are provided within the UBPR. These ratios generally compare the amount of applicable taxes to net operating income. In order to ensure that only taxable income is compared to applicable income taxes, certain adjustments are necessary for income received on municipal securities and other investments which are tax-exempt in nature. If the tax ratios provided on the UBPR differ significantly from the rate of taxes that should have been paid, based upon the bank's tax bracket, further analysis is necessary to determine the reasons for such a discrepancy. For example, a bank with a high tax ratio may have invested too heavily in tax-exempt assets, with the result that the potential tax savings was not fully realized. In addition, certain tax incentives, such as investment tax credits received in connection with the acquisition of bank equipment, may have the effect of lowering the tax rate. The ability or inability to carryback or carryforward operating losses for tax purposes will also impact the bank's effective tax rate. Tax ratios may appear abnormal due to management's failure to adequately accrue for income tax expense on a current basis. Appropriate tax accruals should be made on a regular basis and at least with enough frequency to allow for the preparation of accurate Call Reports.

In almost all cases, applicable income taxes reported in the Call Report will differ from the amounts reported to taxing authorities. The applicable income tax expense or benefit that is reflected in the Call Report should include both taxes currently paid or payable (or receivable) and deferred income taxes. Deferred income tax expense or benefit is measured as the change in the net deferred tax assets or liabilities for the period reported. Deferred tax liabilities and assets represent the amount by which taxes payable (or receivable) are expected to increase or decrease in the future as a result of "temporary differences" and net operating loss or tax credit carry forwards that exist at the Call Report date. Refer to the Call Report Glossary for additional information on FAS 109, *Accounting for Income Taxes*.

A higher than normal ratio of applicable income taxes to NOI may result from upstreaming income tax payments to a bank holding company. The FDIC issued a policy statement (refer to FDIC Law, Regulation, and Related Acts) that covers income tax allocation in a holding company structure. In general, the statement requires that cash transfers paid by the bank to the holding company not exceed the amount of tax the bank would have paid had a tax return been filed on a separate return basis. In addition, any payments made to the holding company shall not be required to be remitted until such time as those payments would have been due to the taxing authority. Thus, deferred income taxes on bank's books should not be upstreamed to the holding company until such time as those taxes would be otherwise payable to the taxing authority. Holding companies and subsidiary institutions are encouraged to enter into a written, comprehensive tax allocation agreement tailored to their specific circumstances. The agreement should be approved by the respective boards of directors. The policy statement was not intended to limit any tax elections under the Internal Revenue Code, and the term "separate return basis" recognizes that certain adjustments due to particular tax elections may, in certain periods, result in larger payments by the affiliated bank to the parent than would have been made by an unaffiliated bank to the taxing authority. Refer to the aforementioned policy statement for additional information.

Dividends

Earnings are also evaluated on their ability to support capital. This support includes maintaining capital, as well as increasing capital. High earnings retention increases capital more rapidly, but may or may not be necessary for the bank. If growth is low, profits high and capital strong, in relation to assets, a relatively high dividend payout ratio may be acceptable. On the other hand, if growth is rapid, profits are low, and capital is weak, a high dividend payout stands in the way of retaining needed capital. Under such circumstances, a lower payout ratio would clearly be appropriate.

The retention rate must be analyzed relative to the bank’s potential growth rate. A bank in a developing trade area may forecast substantial growth, which cannot be supported by existing capital even if cash dividends are not paid. Since most bank stocks are viewed by the investor as income generating rather than growth related, a low dividend history may hamper the bank's ability to market a new stock offering.

The bank's flexibility to reduce dividend payments should be considered when analyzing the impact of dividends upon earnings. For example, a bank that has a highly-leveraged holding company may lack flexibility to significantly lower dividend declarations, because those dividends are being used to meet debt service requirements. Another example includes institutions that have elected a Sub S status for income tax purposes. In a Sub S institution, shareholders normally pay income taxes on their proportionate share of the institution’s taxable income whether or not a dividend payment or other distribution is made. Therefore, shareholders may attempt to limit the bank’s flexibility to reduce these distributions.

In undercapitalized banks, steps should be taken to strongly discourage the continuation of cash dividends and/or other distributions. If necessary, additional steps should be taken to administratively prohibit such dividends/distributions where the bank is undercapitalized and has a high risk profile, or is substantially undercapitalized, no matter what the degree of perceived risk. There may be isolated instances where the continuation of cash dividends/distributions is warranted even under fairly severe circumstances. In such cases, the continuation of these payments without supervisory action should be fully supported.

Extraordinary Items

Extraordinary items are material events and transactions that are unusual and infrequent. Both of these conditions must exist in order for an event or transaction to be reported as an extraordinary item.

To be unusual, an event or transaction must be highly abnormal or clearly unrelated to the ordinary and typical activities of banks. An event or transaction that is beyond bank management’s control is not automatically considered to be unusual.

To be infrequent, an event or transaction should not reasonably be expected to recur in the foreseeable future. Although the past occurrence of an event or transaction provides a basis for estimating the likelihood of its future occurrence, the absence of a past occurrence does not automatically imply that an event or transaction is infrequent.

Only a limited number of events or transactions qualify for treatment as extraordinary items. Among these are losses that result directly from a major disaster such as an earthquake (except in areas where earthquakes are expected to recur in the foreseeable future), an expropriation, or a prohibition under a newly enacted law or regulation.

For further information, refer to APB Opinion No. 30, *Reporting the Results of Operations*.

Accounting Considerations

The analysis of earnings may be further complicated by the adoption of new accounting standards or changes in accounting methodologies. For instance, prior to the adoption of FAS 91, *Accounting for Nonrefundable Fees and Costs Associated with Originating or Acquiring Loans and Initial Direct Costs of Leases*, institutions accounted for loan origination fees and costs in different ways. When analyzing earnings, examiners should be aware of changes in accounting standards that may have materially affected related ratios and, when material, make necessary adjustments to the ratios, on a tax adjusted basis, to be able to perform trend analysis. Over time, however, adjustments will no longer need to be made as reported operating performance will reflect the implementation of the accounting changes over enough periods that trend analysis will not be affected.

FAS 91 applies to all lending and leasing transactions originated since it took effect in 1988. This accounting standard established the accounting for nonrefundable fees and costs associated with lending, committing to lend, and purchasing a loan or a group of loans. In general, FAS 91 specifies that:

1. Loan origination fees should be recognized over the life of the related loan as an adjustment of yield;

2. Certain direct loan origination costs should be recognized over the life of the related loan as a reduction of the loan's yield;
3. Most loan commitment fees should be deferred, except for specified exceptions; and
4. Loan fees, certain direct loan origination costs, and purchase premiums and discounts on loans shall be recognized as an adjustment of yield generally by the interest method based on the contractual term of the loan.

Prior to adopting FAS 91, banks generally could immediately recognize loan origination fees in income to the extent that they represented a reimbursement to the bank for actual origination costs incurred by the bank to originate the loan. This practice is no longer acceptable.

A more detailed discussion of FAS 91 can be found in the Call Report Glossary.

Quality of Bank Earnings

Earnings quality is the ability of a bank to continue to realize strong earnings performance. It is quite possible for a bank to register impressive profitability ratios and high dollar volumes of income by assuming an unacceptable degree of risk. An inordinately high ROA is often an indicator that the bank is engaged in higher risk activities. For example, bank management may have taken on loans or other investments that provide the highest return possible, but are not of a quality to assure either continued debt servicing or principal repayment. Short-term earnings will be boosted by seeking higher rates for earning assets with higher credit risk. Eventually, however, earnings may suffer if losses in these higher-risk assets are recognized.

In addition, certain of the bank's adversely classified and nonperforming assets, especially those upon which future interest payments are not anticipated, may need to be reflected on a nonaccrual basis for income statement purposes. If such assets are not placed on a nonaccrual status, earnings will be overstated. Similarly, material amounts of troubled debt restructured assets may have an adverse impact on earnings.

As previously discussed, an institution's asset quality has a close relationship to the analysis of earnings quality. Poor asset quality may necessitate increasing the PLLL to bring the ALLL to an appropriate level and must be reviewed for impact on earnings quality.

Additionally, short-term earnings performance can be enhanced by extraordinary items and tax strategies. For example, a bank may dispose of high-yielding assets to record gains in current periods, but may only be able to reinvest the funds at a lower rate of return. Levels and trends in earnings performance would be positive, although future income potential is sacrificed. Conversely, a bank might dispose of assets at a loss to take advantage of tax loss carryback provisions and enhance future earnings potential. Current earnings levels and trends would be poor in such a case, but funds recaptured through this strategy may greatly improve future earnings capacity. The point is that no analysis of earnings is complete without a consideration of earnings quality and a complete investigation and understanding of the strategies employed by bank management.

Planning and Budgeting

Strategic Plan

A strategic plan is a methodology that an organization uses to accomplish important goals and objectives. Regardless of the institution's size, a strategic plan can help an organization outline future goals and objectives and the steps needed to achieve such. For institutions that plan significant growth, new products, new branches, or other initiatives, strategic planning becomes even more important. Many institutions have formal, written strategic plans, while others rely on a much less formal method. If a formal, written strategic plan does not exist, this matter should be discussed with the board/management to determine the institution's overall goals, objectives, and long-term plans. Additional information on Corporate Planning is contained in the Management section of this manual. The Examination Documentation (ED) Modules also provide guidance in this area.

Profit Plan

A profit plan is an overall forecast of the income statement for the period based on management's decisions, intentions, and their estimation of economic conditions. It addresses such things as the anticipated level and volatility of interest rates, local economic conditions, funding strategies, asset mix, pricing, growth objectives, interest rate and maturity mismatches, etc. The accuracy of any such plan is susceptible to the attainability of the aforementioned assumptions.

Budget

Within the profit plan is a budget. The budget is essentially an expense control technique where management decides how much is intended to be spent during the period on individual overhead expense items. The budget should be consistent with the overall business or profit plan. All banks, regardless of size, should be encouraged to prepare a profit plan and budget that addresses the current year and the next operating year. The degree of sophistication or comprehensiveness of a budget and profit plan may vary considerably based on the size of the institution and the complexity of the assets and income sources.

The FDIC issued Part 364 entitled Standards for Safety and Soundness. Appendix A of Part 364 outlines standard procedures that banks should employ periodically to evaluate and monitor earnings, thereby ensuring that earnings are sufficient to maintain adequate capital and reserves. At a minimum, management's analysis of earnings should:

- Compare recent earnings trends relative to equity, assets, or other commonly used benchmarks to the institution's historical results and those of its peers;
- Evaluate the adequacy of earnings given the size, complexity, and risk profile of the institution's assets and operations;
- Assess the source, volatility, and sustainability of earnings, including the effect of nonrecurring or extraordinary income or expenses;
- Take steps to ensure that earnings are sufficient to maintain adequate capital and reserves after considering asset quality and growth rate; and
- Provide periodic earnings reports with adequate information for management and the board of directors to assess earnings performance.

A bank's profit plan and budget should be reviewed for reasonableness with particular attention paid to the underlying assumptions. The forecast and assumptions should be consistent with what is known about the bank such as the volume of classified assets, nonaccrual and renegotiated debt levels, the adequacy of the ALLL, and other examination findings that have earnings implications. Comparison between the bank's forecast for the previous year to actual performance as displayed in the bank's own reports and in the UBPR can provide a reasonableness check. Any material discrepancies should be discussed with management; and, if the explanation is unreasonable, the bank's forecast may need to be adjusted to determine the effect of more reasonable assumptions.

If there is no bank plan or budget, examiners may need to develop their own forecast to aid in their judgments. In any case, it will normally be necessary to discuss future prospects with management. Care should be taken in these discussions not to present the examiner's forecast as absolute, or to recommend specific strategies or transactions to management based on an examiner's forecast. Planning is properly the function of management. Examiner efforts are only an attempt to discover any undue risk and highlight any factors that may significantly impact future performance in either a positive or negative manner.

Deficiencies in the profit plan or budget, or the lack thereof, should be documented in the appropriate section of the examination report.

EVALUATION OF EARNINGS PERFORMANCE

This rating reflects not only the quantity and trend of earnings, but also factors that may affect the sustainability or quality of earnings. The quantity as well as the quality of earnings can be affected by excessive or inadequately managed credit risk that may result in loan losses and require additions to the allowance for loan and lease losses, or by high levels of market risk that may unduly expose an institution's earnings to volatility in interest rates. The quality of earnings may also be diminished by undue reliance on extraordinary gains, nonrecurring events, or favorable tax effects. Future earnings may be adversely affected by an inability to forecast or control funding and operating expenses, improperly executed or ill-advised business strategies, or poorly managed or uncontrolled exposure to other risks. The rating of an institution's earnings is based upon, but not limited to, an assessment of the following evaluation factors:

- The level of earnings, including trends and stability.
- The ability to provide for adequate capital through retained earnings.
- The quality and sources of earnings.
- The level of expenses in relation to operations.
- The adequacy of the budgeting systems, forecasting processes, and management information systems in general.
- The adequacy of provisions to maintain the allowance for loan and lease losses and other valuation allowance accounts.
- The earnings exposure to market risk such as interest rate, foreign exchange, and price risks.

Ratings

1. A rating of 1 indicates earnings that are strong. Earnings are more than sufficient to support operations and maintain adequate capital and allowance levels after consideration is given to asset quality, growth, and other factors affecting the quality, quantity, and trend of earnings.

2. A rating of 2 indicates earnings that are satisfactory. Earnings are sufficient to support operations and maintain adequate capital and allowance levels after consideration is given to asset quality, growth, and other factors affecting the quality, quantity, and trend of earnings. Earnings that are relatively static, or even experiencing a slight decline, may receive a 2 rating provided the institution's level of earnings is adequate in view of the assessment factors listed above.

3. A rating of 3 indicates earnings that need to be improved. Earnings may not fully support operations and provide for the accretion of capital and allowance levels in relation to the institution's overall condition, growth, and other factors affecting the quality, quantity, and trend of earnings.

4. A rating of 4 indicates earnings that are deficient. Earnings are insufficient to support operations and maintain appropriate capital and allowance levels. Institutions so rated may be characterized by erratic fluctuations in net income or net interest margin, the development of significant negative trends, nominal or unsustainable earnings, intermittent losses, or a substantive drop in earnings from the previous years.

5. A rating of 5 indicates earnings that are critically deficient. A financial institution with earnings rated 5 is experiencing losses that represent a distinct threat to its viability through the erosion of capital.

←

INTRODUCTION

Liquidity reflects a financial institution's ability to fund assets and meet financial obligations. Liquidity is essential in all banks to meet customer withdrawals, compensate for balance sheet fluctuations, and provide funds for growth. Funds management involves estimating liquidity requirements and meeting those needs in a cost-effective way. Effective funds management requires financial institutions to estimate and plan for liquidity demands over various periods and to consider how funding requirements may evolve under various scenarios, including adverse conditions. Banks must maintain sufficient levels of cash, liquid assets, and prospective borrowing lines to meet expected and contingent liquidity demands.

Liquidity risk reflects the possibility an institution will be unable to obtain funds, such as customer deposits or borrowed funds, at a reasonable price or within a necessary period to meet its financial obligations. Failure to adequately manage liquidity risk can quickly result in negative consequences for an institution despite strong capital and profitability levels. Management must maintain sound policies and procedures to effectively measure, monitor, and control liquidity risks.

A certain degree of liquidity risk is inherent in banking. An institution's challenge is to accurately measure and prudently manage liquidity demands and funding positions. To efficiently support daily operations and provide for contingent liquidity demands, banks must:

- Establish an appropriate liquidity risk management program,
- Ensure adequate resources are available to fund ongoing liquidity needs,
- Establish a funding structure commensurate with risks,
- Evaluate exposures to contingent liquidity events, and
- Ensure sufficient resources are available to meet contingent liquidity needs.

←

RISK MANAGEMENT PROGRAM

An institution's liquidity risk management program establishes the liquidity management framework. Comprehensive and effective programs encompass all elements of a bank's liquidity, ranging from how the institution manages routine liquidity needs to managing liquidity during a severe stress event. Elements of a sound liquidity risk management program include:

- Effective management and board oversight;
- Appropriate liquidity management policies, procedures, strategies, and risk limits;
- Comprehensive liquidity risk measurement and monitoring systems;
- Adequate levels of marketable assets;
- Diverse mix of existing and potential funding sources;
- Comprehensive contingency funding plans;
- Appropriate plans for potential stress events; and
- Effective internal controls and independent audits.

The formality and sophistication of effective liquidity management programs correspond to the type and complexity of an institution's activities, and examiners should assess whether programs meet the institution's needs. Examiners should consider whether liquidity risk management activities are integrated into the institution's overall risk management program and address liquidity risks associated with new or existing business strategies.

Close oversight and sound risk management processes (particularly when planning for potential stress events) are especially important if management pursues asset growth strategies that rely on new or potentially volatile funding sources.

Board and Senior Management Oversight

Board oversight is critical to effective liquidity risk management. The board is responsible for establishing the institution's liquidity risk tolerance and clearly communicating it to all levels of management. Additionally, the board is also responsible for reviewing, approving, and periodically updating liquidity management strategies, policies, procedures, and risk limits. When assessing the effectiveness of board oversight, examiners should consider whether the board:

- Understands and periodically reviews the institution's current liquidity position and contingency funding plans;
- Understands the institution's liquidity risks and periodically reviews information necessary to maintain this understanding;
- Establishes an asset/liability committee (ALCO) and guidelines for electing committee members, assigning responsibilities, and establishing meeting frequencies;
- Establishes executive-level lines of authority and responsibility for managing the institution's liquidity risk;
- Provides appropriate resources to management for identifying, measuring, monitoring, and controlling liquidity risks; and
- Understands the liquidity risk profiles of significant subsidiaries and affiliates.

Management is responsible for appropriately implementing board-approved liquidity policies, procedures, and strategies. This responsibility includes overseeing the development and implementation of appropriate risk measurement and reporting systems, contingency funding plans, and internal controls. Management is also responsible for regularly reporting the institution's liquidity risk profile to the board.

Examiners should consider whether an ALCO (or similar entity) actively monitors the institution's liquidity profile. Effective ALCOs typically have sufficient representation across major functions (e.g., lending, investments, wholesale and retail funding, etc.) to influence the liquidity risk profile. The committee is usually responsible for ensuring that liquidity reports include accurate, timely, and relevant information on risk exposures.

Examiners should evaluate corporate governance by reviewing liquidity management processes (including daily, monthly, and quarterly activities), committee minutes, liquidity and funds management policies and procedures, and by holding discussions with management. Additionally, examiners should consider the findings of independent reviews and prior reports of examination when assessing the effectiveness of corrective actions.

Liquidity Management Strategies

Liquidity management strategies involve short- and long-term decisions that can change over time, especially during times of stress. Therefore, the institutions' policies often require management to meet regularly and consider liquidity costs, benefits, and risks as part of the institution's overall strategic planning and budgeting processes. As part of this process, management typically:

- Performs periodic liquidity and profitability evaluations for existing activities and strategies;
- Identifies primary and contingent funding sources needed to meet daily operations, as well as seasonal and cyclical cash flow fluctuations;
- Ensures liquidity management strategies are consistent with the board's expressed risk tolerance; and
- Evaluates liquidity and profitability risks associated with new business activities and strategies.

Collateral Position Management

Assets are a key source of funds for financial institutions as they can generate substantial cash inflows through principal and interest payments. Assets can also provide funds when sold or when used as collateral for borrowings. Financial institutions routinely pledge assets when borrowing funds or obtaining credit lines through Federal Home Loan Banks, the Federal Reserve discount window, or other banks.

Examiners should consider whether the institution established reporting systems that facilitate the monitoring and management of assets pledged as collateral for borrowed funds. At a minimum, pledged asset reports typically detail the value of assets currently pledged relative to the amount of security required and identify the type and amount of unencumbered assets available for pledging.

Examiners should also consider whether the reporting systems are commensurate with borrowing activities and the institution's strategic plans. Institutions with limited amounts of long-term borrowings may be able to monitor collateral levels adequately by reviewing monthly or quarterly reports. Institutions with material payment, settlement, and clearing activities benefit from actively monitoring short- (including intraday), medium-, and long-term collateral positions.

Effective management teams thoroughly understand all borrowing agreements (contractual or otherwise) that may require the bank to provide additional collateral, substitute existing collateral, or deliver collateral. Such requirements may be triggered by changes in an institution's financial condition. Examiners should determine whether management considers potential changes to collateral requirements in cash flow projections, stress tests, and contingency funding plans. Examiners should also determine whether management considers the operational and timing requirements associated with physically accessing collateral (such as at a custodian institution or a securities settlement location where the collateral is held).

←

POLICIES, PROCEDURES, & REPORTING

Liquidity Policies and Procedures

Comprehensive written policies, procedures, and risk limits form the basis of liquidity risk management programs. All financial institutions benefit from board-approved liquidity management policies and procedures specifically tailored for their institution.

Even when operating under a holding company with centralized planning and decision-making, the bank's directors are responsible for ensuring that the structure, responsibility, and controls for managing their institution's liquidity risk are clearly documented. To fulfill their oversight responsibilities, directors regularly monitor reports that highlight bank-only liquidity factors.

While there is no reason to criticize the existence of centralized planning and decision-making, each bank's board of directors has a legal responsibility to maintain policies, procedures, and risk limits tailored to its individual bank's risk profile.

Boards that review and approve liquidity policies at least annually ensure such policies remain relevant and appropriate for the institutions' business model, complexity, and risk profile. Written policies are important for defining the scope of the liquidity risk management program and ensuring that:

- Sufficient resources are devoted to liquidity management,
- Liquidity risk management is incorporated into the institution's overall risk management process, and
- Management and the board share an understanding of strategic decisions regarding liquidity.

Effective policies and procedures address liquidity matters (such as legal, regulatory, and operational issues) separately for legal entities, business lines, and, when appropriate, individual currencies. Sound liquidity and funds management policies typically:

- Provide for the effective operation of the ALCO. ALCO policies would address responsibilities for assessing current and projected liquidity positions, implementing board-approved strategies, reviewing policy exceptions, documenting committee actions, and reporting to the board;
- Provide for the periodic review of the bank's deposit structure. Effective reviews typically include assessments of the volume and trend of total deposits, the types and rates of deposits, the maturity distribution of time deposits, and competitor rate information. Other information considered in the reviews, when applicable, includes the volume and trend of large time deposits, public funds, out-of-area deposits, potentially rate sensitive depositors, wholesale deposits, and uninsured deposits;
- Address permissible funding sources and concentration limits. Items addressed generally include funding types with similar rate sensitivity or volatility, such as brokered or Internet deposits and deposits generated through promotional offers.
- Provide a method of computing the bank's cost of funds;
- Establish procedures for measuring and monitoring liquidity. Procedures generally include static measurements and cash flow projections that forecast base case and stress scenarios;
- Address the type and mix of permitted investments. Items addressed typically include the maturity distribution of the portfolio, which investments are available for liquidity purposes, and the level and quality of unpledged investments;
- Provide for an adequate system of internal controls. Controls typically require periodic, independent reviews of liquidity management processes and compliance with internal policies, procedures, and risk limits;
- Include a contingency funding plan that identifies alternate funding sources if liquidity projections are incorrect or a liquidity crisis arises;
- Require periodic testing of liquidity lines;
- Establish procedures for reviewing and documenting assumptions used in liquidity projections;
- Define procedures for approving exceptions to policies, limits, and authorizations;
- Identify permissible wholesale funding sources;
- Define authority levels and procedures for accessing wholesale funding sources;
- Establish a process for measuring and monitoring unused borrowing capacity;
- Convey the board's risk tolerance by establishing target liquidity ratios and parameters under various time horizons and scenarios; and
- Include other items unique to the bank.

Risk Tolerances

Examiners should consider whether liquidity policies accurately reflect the board's risk tolerance and delineate qualitative and quantitative guidelines commensurate with the institution's business profile and balance sheet complexity. Typical risk guidelines include:

- Targeted cash flow gaps over discrete and cumulative periods and under expected and adverse business conditions;
- Expected levels of unencumbered liquid assets;
- Measures for liquid asset coverage ratios and limits on potentially unstable liabilities;
- Concentration limits on assets that may be difficult to convert into cash (such as complex financial instruments, bank-owned life insurance, and less-marketable loan portfolios);
- Limits on the level of borrowings, brokered funds, or exposures to single fund providers or market segments;
- Funding diversification standards for short-, medium-, and long-term borrowings and instrument types;
- Limits on contingent liability exposures such as unfunded loan commitments or lines of credit;

- Collateral requirements for derivative transactions and secured lending;
- Limits on material exposures in complex activities (such as securitizations, derivatives, trading, and international activities).

Examiners should consider whether management and the board establish meaningful risk limits, periodically evaluate the appropriateness of established limits, and compare actual results to approved risk limits. Identified policy exceptions and related corrective actions are typically noted in board or committee minutes.

Liquidity Reporting

Timely and accurate information is a prerequisite to sound funds management practices. Banks benefit from liquidity risk reports that clearly highlight the bank's liquidity position, risk exposures, and level of compliance with internal risk limits.

Examiners should consider the adequacy of liquidity reporting procedures. Typically, bank personnel tasked with ongoing liquidity administration receive liquidity risk reports at least daily. Senior officers may receive liquidity reports weekly or monthly, and the board of directors may receive liquidity risk reports monthly or quarterly. Depending on the complexity of the business mix and liquidity risk profile, institutions may increase, sometimes on short notice, the frequency of liquidity reporting.

The format and content of liquidity reports will vary depending on the characteristics of each bank and its funds management practices. Examiners should consider whether an institution's management information systems and internal reports provide accurate, pertinent information such as:

- Liquidity needs and the sources of funds available to meet these needs over various time horizons and scenarios (reports are often referred to as pro-forma cash flow reports, sources and uses reports, or scenario analyses);
- Collateral positions, including pledged and unpledged assets (and when necessary, the availability of collateral by legal entity, jurisdiction, and currency exposure);
- Public funds and other material providers of funds (including rate and maturity information);
- Funding categories and concentrations;
- Asset yields, liability costs, net interest margins, and variations from the prior month and budget (beneficial reports are detailed enough to permit an analysis of interest margin variations);
- Early warning indicators for contingency funding events;
- Policy exceptions;
- Interest rate projections and economic conditions in the bank's trade area;
- Information concerning non-relationship or higher-cost funding programs;
- The stability of deposit customers and providers of wholesale funds;
- The level of highly liquid assets;
- Stress test results; and
- Other items unique to the bank.

←

LIQUIDITY RISK MEASUREMENT

To identify potential funding gaps, banks typically monitor cash flows, assess the stability of funding sources, and project future funding needs. When assessing an institution's liquidity rating, examiners should evaluate the adequacy of an institution's liquidity risk measurement and monitoring procedures.

Pro-Forma Cash Flow Projections

Historically, most financial institutions used single point-in-time (static) measurements (such as loan-to-deposit or loan-to-asset ratios) to assess their liquidity position. Static liquidity measures provide valuable information and remain a key part of banks' liquidity analysis. However, cash flow forecasting can enhance a financial institution's ability to monitor and manage liquidity risk.

Cash flow forecasts can be useful for all banks and become essential when operational areas (loans, deposits, investments, etc.) are complex or managed separately from other areas in the bank. Cash flow projections enhance management's ability to evaluate and manage these areas individually and collectively.

The sophistication of cash flow forecasting ranges from the use of simple spreadsheets to comprehensive liquidity risk models. Some vendors that offer interest rate risk (IRR) models provide options for modeling liquidity cash flows because the base information is already maintained for IRR modeling. When reviewing liquidity risk models, examiners should ensure management compares funding sources and liquidity needs, over various periods, using modeling assumptions that are appropriate for managing liquidity rather than IRR.

Cash flow projections typically forecast funding sources and uses over short-, medium-, and long-term time horizons. Non-complex community banks that are in a sound condition may forecast short-term positions monthly. More complex institutions may need to perform weekly or daily forecasts, and institutions with large payment systems and settlement activities may need to conduct intra-day measurements. All institutions benefit from having the ability to increase the frequency of monitoring and reporting during a stress event.

Effective cash flow analysis allows management to plan for tactical (short-term) and strategic (medium- and long-term) liquidity needs. Examiners should review the bank's procedures, assumptions, and information used to develop cash flow projections. For example, examiners should consider whether funding sources and uses are adequately stratified, as excessive account aggregations in liquidity analysis can mask substantial liquidity risk. Similar to measuring IRR, there are advantages to utilizing account level information. For some institutions, gathering and measuring information on specific accounts may not be feasible due to information system limitations. Although the advantages of using detailed account information may not be as evident for a non-complex institution, generally, all institutions can benefit from using more detailed account information in their liquidity models.

Examiners should carefully assess the assumptions that institutions use when projecting cash flows. The reliability of the projections is enhanced when projections are based on reasonable assumptions and reliable data. Additionally, the accuracy and reliability of cash flow projections is enhanced when projected cash flows consider contractual and expected cash flows. For example, when projecting funding requirements for construction loans, the accuracy of cash flow projections is enhanced when management includes estimates of the amount of available credit that will actually be drawn in a given period, not simply the full amount of contractual obligations. Additionally, to improve the accuracy of forecasting maturing time deposits, particularly those obtained through special rate promotions, the analysis should consider the retention rate of maturing deposits.

Modeling assumptions play a critical role in measuring liquidity risks and projecting cash flows. Therefore, institutions benefit from ensuring key assumptions are reasonable, well documented, and periodically reviewed and approved by the board. Ensuring the accuracy of assumptions is also important when assessing the liquidity risk of complex assets, liabilities, and off-balance sheet positions and can be critical when evaluating the availability of funding sources under adverse, contingent liquidity scenarios. Accurate and reliable cash flow forecasting can benefit institutions by reducing liquidity risks and allowing institutions to maintain a lower liquid asset cushion.

Back Testing

The reliability of cash flow projections may also be enhanced if institutions evaluate assumptions about customer behavior, separately estimate gross cash flows on both sides of the balance sheet, and compare modeling projections to actual results (back testing). Back testing allows management to make adjustments to cash flow models and modeling assumptions, as appropriate, to reflect changes in cash flow characteristics.

Scenario Analysis

Cash flow projections can also be used in scenario analysis and developing contingency funding plans. Institutions typically start with base case projections that assume normal cash flows, market conditions, and business operations over the selected time horizon. Management then tests stress scenarios by changing various cash flow assumptions in the base case scenario. For example, if the stress scenario assumed a change in a Prompt Corrective Action (PCA) capital category that triggered interest rate restrictions and brokered deposit limitations, management should adjust assumptions to reflect the possible limitation or elimination of access to affected funding sources. Management typically uses this information in developing funding plans to mitigate these risks.

←

FUNDING SOURCES - ASSETS

The amount of liquid assets that a bank maintains is generally a function of the stability of its funding structure, the risk characteristics of the balance sheet, and the adequacy of its liquidity risk measurement program. Generally, a lower level of unencumbered liquid assets may be sufficient if funding sources are stable, established borrowing facilities are largely unused, and other risk characteristics are predictable. A higher level of unencumbered liquid assets may be required if:

- Bank customers have numerous alternative investment options,
- Recent trends show a substantial reduction in large liability accounts,
- The bank has a material reliance on less stable funding sources,
- The loan portfolio includes a high volume of non-marketable loans,
- The bank expects several customers to make material draws on unused lines of credit,
- Deposits include substantial amounts of short-term municipal accounts,
- A concentration of credits was extended to an industry with existing or anticipated financial problems,

- A close relationship exists between individual demand accounts and principal employers in the trade area who have financial problems,
- A material amount of assets is pledged to support wholesale borrowings, or
- The institution's access to capital markets is impaired.

A bank's assets provide varying degrees of liquidity and can create cash inflows and outflows. Institutions generally retain a certain level of highly liquid assets to meet immediate funding needs, and hold other types of investments to provide liquidity for meeting ongoing operational needs and responding to contingent funding events. To balance profitability goals and liquidity demands, management must carefully weigh the full benefits (yield and increased marketability) of holding liquid assets against the expected higher returns associated with less liquid assets. Income derived from holding longer-term, higher-yielding assets may be offset if an institution is forced to sell the assets quickly due to adverse balance sheet fluctuations.

Cash and Due from Accounts

Cash and due from accounts are essential for meeting daily liquidity needs. Institutions rely on cash and due from accounts to fund deposit account withdrawals, disburse loan proceeds, cover cash letters, fund bank operations, meet reserve requirements, and provide compensating balances relating to correspondent bank accounts/services.

Loan Portfolio

The loan portfolio is an important factor in liquidity management. Loan payments provide steady cash flows, and loans can be used as collateral for secured borrowings or sold for cash in the secondary loan market. However, the quality of the loan portfolio can directly impact liquidity. For example, if an institution encounters asset quality issues, operational cash flows may be affected by the level of non-accrual borrowers and late payments.

For many institutions, loans serve as collateral for wholesale borrowings such as Federal Home Loan Bank (FHLB) borrowings. If asset quality issues exist, an institution may find that delinquent loans do not qualify as collateral. Also, higher amounts of collateral may be required because of doubts about the overall quality of the portfolio. These "haircuts" can be substantial and are an important consideration in stress tests.

Comprehensive liquidity analysis includes consideration of contractual requirements and customers' behavior when forecasting loan cash flows. Prepayments and renewals can significantly affect contractual cash flows for many types of loans. Customer prepayments are a common consideration for residential mortgage loans (and mortgage-backed securities) and can be a factor for commercial and commercial real estate loans (and related securities). Assumptions related to revolving lines of credit and balloon loans can also have a material effect on cash flows. For example, examiners should determine whether management's assumption for loans generating cash flow in accordance with contractual obligations is supported by historical data.

Asset Sales/Securitizations

As noted above, assets can be used as collateral for secured borrowings or sold for cash in the secondary market. Sales in the secondary market can provide fee income, relief from interest rate risk, and a funding source to the originating bank. However, for an asset to be saleable at a reasonable price in the secondary market, it must generally conform to market (investor) requirements. Because loans and loan portfolios may have unique features or defects that hinder or prevent their sale into the secondary market, institutions benefit from thoroughly reviewing loan characteristics and documenting assumptions related to loan portfolios when developing cash flow projections.

Some institutions are able to use securitizations as a funding vehicle by converting a pool of assets into cash. Asset securitization typically involves the transfer or sale of on-balance sheet assets to a third party that issues mortgage-backed securities (MBS) or asset-backed securities (ABS). These instruments are then sold to investors. The investors are paid from the cash flow from the transferred assets. Assets that are typically securitized include credit card receivables, automobile receivables, commercial and residential mortgage loans, commercial loans, home equity loans, and student loans.

Securitization can be an effective funding method for some banks. However, there are several risks associated with using securitization as a funding source. For example:

- Some securitizations have early amortization clauses to protect investors if the performance of the underlying assets does not meet specified criteria. If an early amortization clause is triggered, the issuing institution needs to begin paying principal to bondholders earlier than originally anticipated and have to fund new receivables that would have otherwise been transferred to the trust. Institutions involved in securitizations benefit from monitoring asset performance to better anticipate cash flow and funding ramifications due to early amortization clauses.
- If the issuing institution has a large concentration of residual assets, the institution's overall cash flow

might be dependent on the residual cash flows from the performance of the underlying assets. If the performance of the underlying assets is worse than projected, the institution's overall cash flow will be less than anticipated.
- Residual assets retained by the issuing institution are typically illiquid assets for which there is no active market. Additionally, the assets are not acceptable collateral to pledge for borrowings.
- An issuer's market reputation can affect its ability to securitize assets. If the bank's reputation is damaged, issuers might not be able to economically securitize assets and generate cash from future sales of loans to the trust. This is especially true for institutions that are relatively new to the securitization market.
- The timeframe required to securitize loans held for sale may be considerable, especially if the institution has limited securitization experience or encounters unforeseen problems.

Institutions that identify asset sales or securitizations as contingent liquidity sources, particularly institutions that rarely sell or securitize loans, benefit from periodically testing the operational procedures required to access these funding sources. Market-access testing helps ensure procedures work as anticipated and helps gauge the time needed to generate funds; however, testing does not guarantee the funding sources will be available or on satisfactory terms during stress events.

A thorough understanding of applicable accounting and regulatory rules is critical when securitizing assets. Accounting standards make it difficult to achieve sales treatment for certain financial assets. The standards influence the use of securitizations as a funding source because transactions that do not qualify for sales treatment require the selling institution to account for the transfer as a secured borrowing with a pledge of collateral. As such, institutions must account for, and risk weight, the transferred financial assets as if the transfer had not occurred. Accordingly, institutions should continue to report the transferred assets in financial statements with no change in the measurement of the financial assets transferred.

When financial assets are securitized and accounted for as a sale, institutions often provide contractual credit enhancements, which may involve over-collateralization, retained subordinated interests, asset repurchase obligations, cash collateral accounts, spread accounts, or interest-only strips. Part 324 of the FDIC Rules and Regulations requires the issuing institution to hold capital as a buffer against the retained credit risk arising from these contractual credit enhancements.

There can also be non-contractual support for ABS transactions that would be considered implicit recourse. The recourse may create credit, liquidity, and regulatory capital implications for issuers that provide implicit support for ABS transactions. Institutions typically provide implicit recourse in situations where management perceives that the failure to provide support, even though not contractually required, would damage the institution's future access to the ABS market. For risk-based capital purposes, institutions deemed to be providing implicit recourse are generally required to hold capital against the entire outstanding amount of assets sold, as though they remained on the books.

The federal banking agencies' concerns over the retained credit and other risks associated with such implicit support are detailed in the *Interagency Guidance on Implicit Recourse in Asset Securitizations* (See FDIC's Financial Institution Letter 52-2002).

Investment Portfolio

An institution's investment portfolio can provide liquidity through regular cash flows, maturing securities, the sale of securities for cash, or by pledging securities as collateral for borrowings, repurchase agreements, or other transactions. Institutions can benefit from periodically assessing the quality and marketability of the portfolio to determine:

- The level of unencumbered securities available to pledge for borrowings,
- The financial impact of unrealized gains and losses,
- The effect of changes in asset quality, and
- The potential need to provide additional collateral should rapid changes in market rates significantly reduce the value of longer-duration investments pledged to secure borrowings.

FUNDING SOURCES – LIABILITIES

Deposits are the most common funding source for many institutions; however, other liability sources such as borrowings can also provide funding for daily business activities, or as alternatives to using assets to satisfy liquidity needs. Deposits and other liability sources are often differentiated by their stability and customer profile characteristics.

Core Deposits

Core deposits are generally stable, lower-cost funding sources that typically lag behind other funding sources in repricing during a period of rising interest rates. The deposits are typically funds of local customers that also have a borrowing or other relationship with the institution. Convenient branch locations, superior customer service, extensive ATM networks, and low or no fee accounts are factors that contribute to the stability of the deposits. Other factors include the insured status of the account and the type of depositor (retail, commercial, municipality, etc.).

Examiners should assess the stability of deposit accounts when reviewing liquidity and funds management practices. Generally, higher-cost, non-relationship deposits, such as Internet deposits or deposits obtained through special-rate promotions, may be considered less-stable funding sources. Brokered deposits are not considered core deposits or a stable funding source due to the brokered status and wholesale characteristics.

Core deposits are defined in the Uniform Bank Performance Report (UBPR) User's Guide as the sum of all transaction accounts, money market deposit accounts (MMDAs), nontransaction other savings deposits (excluding MMDAs), and time deposits of $250,000 and below, less fully insured brokered deposits of $250,000 and less. In some instances, core deposits included in the UPBR's core deposit definition might exhibit characteristics associated with less stable funding sources. For example, out-of-area certificates of deposit (CDs) of $250,000 or less that are obtained from a listing service may have less stability although they are included in core deposits under the UBPR definition. Management and examiners should not automatically view these deposits as a stable funding source without additional analysis. Alternatively, some deposit accounts generally viewed as volatile, non-core funds by UBPR definitions (for example, CDs larger than $250,000) might be considered relatively stable after a closer analysis. For instance, a local depositor might have CDs larger than $250,000 that may be considered stable because the depositor has maintained those deposits with the institution for several years.

While some deposit relationships over $250,000 remain stable when the institution is in good condition, such relationships might become less stable due to their uninsured status if the institution experiences financial problems. Additionally, deposits identified as stable during good economic conditions may not be reliable funding sources during stress events. Therefore, examiners should consider whether institutions identify deposit accounts likely to be unstable in times of stress and appropriately reflect such deposits in its liquidity stress testing.

Examiners should not assume that all deposits meeting the UBPR definition of *core* are necessarily stable or that all deposits defined as *non-core* are automatically volatile. Examiners should determine whether management considers the stability of deposit accounts and significant customer relationships and reflects them accordingly in the bank's liquidity monitoring and reporting systems. When analyzing the stability of deposit funding sources, UBPR accounts and ratios should be considered in light of the balance sheet composition, risk profile, deposit stability trends, and other relevant and unique characteristics of the institution.

Deposit Management Programs

The critical role deposits play in a bank's successful operation demonstrates the importance of implementing programs for retaining or expanding the deposit base. Strong competition for depositors' funds and customers' preference to receive market deposit rates also highlight the benefit of deposit management programs. Effective deposit management programs generally include:

- Regular reports detailing existing deposit types and levels,
- Projections for asset and deposit growth,
- Associated cost and interest rate scenarios,
- Clearly defined marketing strategies,
- Procedures to compare results against projections, and
- Steps to revise the plans when needed.

Deposit management programs generally take into account the make-up of the market-area economy, local and national economic conditions, and the potential for investing deposits at acceptable margins. Other considerations include management expertise, the adequacy of bank operations, the location and size of facilities, the nature and degree of bank and non-bank competition, and the effect of monetary and fiscal policies on the bank's service area and capital markets in general.

Effective deposit management programs are monitored and adjusted as necessary. The long-range success of such programs is closely related to management's ability to identify the need for changes quickly. Effective programs include procedures for accurately projecting deposit trends and carefully monitoring the potential volatility of the accounts (e.g., stable, fluctuating, seasonal, brokered, etc.).

Wholesale Funds

Wholesale funds include, but are not limited to, brokered deposits, Internet deposits, deposits obtained through listing services, foreign deposits, public funds, federal funds purchased, FHLB advances, correspondent line of credit advances, and other borrowings.

Providers of wholesale funds closely track institutions' financial condition and may cease or curtail funding, increase interest rates, or increase collateral requirements if they determine an institution's financial condition is deteriorating. As a result, some institutions may experience liquidity problems due to a lack of wholesale funding availability when funding needs increase.

The Internet, listing services, and other automated services enable investors who focus on yield to easily identify high-yield deposits. Customers who focus primarily on yield are a less stable source of funding than customers with typical deposit relationships. If more attractive returns become available, these customers may rapidly transfer funds to new institutions or investments in a manner similar to that of wholesale investors.

It is important to measure the impact of the loss of wholesale funding sources on the institution's liquidity position. The challenge of measuring, monitoring, and managing liquidity risk typically increases as the use of wholesale and nontraditional funding sources increases. Institutions that rely more heavily on wholesale funding will often need enhanced funds management and measurement processes, such as scenario modeling. In addition, contingency planning and capital management take on added significance.

Brokered and Higher-Rate Deposits

Section 29 of the FDI Act, as implemented by Part 337 of the FDIC Rules and Regulations, defines a brokered deposit as a deposit obtained through or with assistance of a deposit broker. The term deposit broker is generally defined by Section 29 as any person engaged in the business of placing deposits, or facilitating the placement of deposits, of third parties with insured depository institutions.

The brokered deposit statute and regulations provide several exceptions to this definition of deposit broker. Some exceptions include an insured depository institution or its employee placing funds with that insured depository institution, certain trust departments of insured depository institutions, certain trustees and plan administrators, an agent whose primary purpose is not to place funds with insured depository institutions, and insured depository institutions acting as an intermediary or agent for a government sponsored minority or women-owned deposit program.

Listing Services

Listing service companies do not fall under the definition of a deposit broker if certain criteria are met. A listing service is a company that connects banks seeking a deposit with those seeking to place a deposit. In doing so, the listing service compiles and posts banks' deposit rate information for consideration by interested depositors. A particular company can be a listing service (compiler of information) as well as a deposit broker (facilitating the placement of deposits). In recognition of this possibility, certain criteria are considered for determining when a listing service qualifies as a deposit broker. A listing service is not a deposit broker if:

- The person or entity providing the listing service is compensated solely by means of subscription fees (fees paid by subscribers as payment for their opportunity to see the rates gathered by the listing service) and/or listing fees (fees paid by depository institutions as payment for their opportunity to list their rates). The listing service does not require a depository institution to pay for other services offered by the listing service or its affiliates as a condition precedent to being listed.
- The fees paid by depository institutions are flat fees (i.e., they are not calculated based on the number or dollar amount of deposits accepted by the depository institution as a result of the listing of the depository institution's rates).
- In exchange for fees, the listing service performs no service except the gathering and transmission of information concerning the availability of deposits.
- The listing service is not involved in placing deposits. Any funds to be invested in deposit accounts are remitted directly by the depositor to the insured depository institution and not, directly or indirectly, by or through the listing service.

Brokered Sweep Accounts

Some brokerage firms, which are investment companies that invest money in stocks, bonds, and other investments on behalf of clients, operate sweep programs in which brokerage customers are given the option to sweep uninvested cash into a bank deposit. This arrangement provides the brokerage customer with additional yield and insurance coverage on swept funds. These swept funds are generally considered brokered deposits unless the third-party brokerage firm meets the primary purpose exception. An institution must receive a favorable determination from the FDIC before it can exclude these funds from regulatory reporting of brokered deposits. Determinations are initially requested through the appropriate regional office. In determining whether the brokerage firm meets the primary purpose exception, staff considers the following criteria:

- The brokerage firm is affiliated with the bank.
- The funds are not swept into time deposit accounts.

- The amount of swept funds does not exceed 10 percent of the total amount of program assets handled by the brokerage firm (permissible ratio) on a monthly basis. When the brokerage also sweeps funds to nonaffiliated banks, which is typically done when the deposit exceeds the $250,000 deposit insurance limit, these deposits are added to the amount of swept funds for purposes of calculating the permissible ratio.
- The fees in the program are flat fees (i.e., equal per-account or per-customer fees representing payment for recordkeeping or administrative services and not representing payment for placing deposits).

Network and Reciprocal Deposits

Banks sometimes participate in networks established for the purpose of sharing deposits. In such a network, a participating bank places funds, either directly or through a third-party network sponsor, at other participating network banks in order for its customer to receive full deposit insurance coverage.

Some bank networks establish reciprocal agreements allowing participating banks to send and receive identical deposit amounts simultaneously. This reciprocal agreement allows banks to maintain the same amount of funds they had when the customer made their initial deposit while ensuring that deposits well in excess of the $250,000 deposit limit are fully insured. While reciprocal network deposits generally meet the definition of a brokered deposit, under certain conditions a limited amount of reciprocal deposits may be excepted from treatment as brokered deposits.

Section 29(i) of the FDI Act (and implemented through Section 337.6(e)(2) of the FDIC Rules and Regulations), excepts a capped amount of reciprocal deposits from treatment as brokered deposits for those insured depository institutions that qualify as an "agent" institution. The amount of reciprocal deposits that an agent institution may except from treatment as brokered deposits may not exceed the lesser of $5 billion or 20 percent of total liabilities (referred to as the general cap). To qualify as an "agent" institution, the institution must meet one of the following:

- When most recently examined, under section 10(d) of the FDI Act, was found to have a composite condition of outstanding or good, and is well capitalized; or
- Has obtained a brokered deposit waiver from the FDIC; or
- Does not receive an amount of reciprocal deposits that causes the total amount of reciprocal deposits held by the agent institution to be greater than the average of the total amount of reciprocal deposits held by the agent institution on the last day of each of the four calendar quarters preceding the calendar quarter in which the agent institution was found not to have a composite condition of outstanding or good or was determined to be not well capitalized (also referred to as the special cap).

Treatment and reporting may be impacted if an institution receives reciprocal deposits that exceed its applicable cap (general cap or special cap). Agent institutions that are in outstanding or good composite condition and are well capitalized, or have obtained a brokered deposit waiver, are subject to the general cap, and therefore would report and treat only the amount of reciprocals deposits that exceed the general cap as brokered deposits. Agent institutions that are not well capitalized or not well rated and have not received a brokered deposit waiver can only receive an amount of non-brokered reciprocal deposits up to its special cap. If an agent institution subject to the special cap receives an amount of reciprocal deposits in excess of its special cap, it is no longer an agent institution. If an institution is not an agent institution, all of its reciprocal deposits should be treated and reported as brokered deposits.

Examiners should determine whether an institution's reciprocal deposits, that are not being report as brokered, conform to the statutory and regulatory definitions under Section 29(i) of the FDI Act and Section 337.6(e) of the FDIC's Rules and Regulations.

Network member banks may receive other deposits through a network such as (1) deposits received without the institution placing into the network a deposit of the same maturity and same aggregate amount (sometimes referred to as "one-way network deposits") and (2) deposits placed by the institution into the network where the deposits were obtained, directly or indirectly, by or through a deposit broker. Such other network deposits meet the definition of brokered deposits and would not be eligible for, as previously described, the statutory and regulatory exception provided for a capped amount of reciprocal deposits.

The stability of reciprocal deposits may differ depending on the relationship of the initial customer with the institution. Examiners should consider whether management adequately supports their assessments of the stability of reciprocal deposits, or any funding source, for liquidity management and measurement purposes.

Brokered Deposit Restrictions

Section 29 of the FDI Act sets forth restrictions on the acceptance of brokered deposits based on an institutions category. Well capitalized banks may accept, renew, or roll over brokered deposits at any time. An adequately capitalized insured depository institution may not accept, renew, or roll over any brokered deposit unless the institution has applied for and been granted a waiver by the FDIC. An undercapitalized insured depository institution may not accept, renew, or roll over any brokered deposits. If a bank is under any type of formal agreement pursuant to Section 8 of the FDI Act with a directive to meet or maintain any specific capital level, it will no longer be considered well capitalized for the purposes of Part 337.

With respect to adequately capitalized institutions that have been granted a brokered deposit waiver, any safety and soundness concerns arising from the acceptance of brokered deposits are ordinarily addressed by the conditions imposed in granting the waiver application. In monitoring such conditions, it is incumbent on the examiner not only to verify compliance, but also to assess whether any unanticipated problems are being created.

Deposit Rate Restrictions

In addition to the brokered deposit restrictions noted above, Section 29 of the FDI Act also places certain restrictions on deposit interest rates for banks that are less than well capitalized. Deposit rate restrictions prevent a bank that is not well capitalized from circumventing the prohibition on brokered deposits by offering rates significantly above market in order to attract a large volume of deposits quickly. Under Section 337.6 of the FDIC's Rules and Regulations, a bank that is not well capitalized may not offer deposit rates more than 75 basis points above average national rates for deposits of similar size and maturity (referred to as the national rate cap).

The national rate is a simple average of rates paid by all banks and branches. On a weekly basis, the FDIC publishes national rate data (at www.fdic.gov) that can be used to determine conformance with the interest rate restrictions. If a bank believes that the national rate does not correspond to the actual rates in the bank's particular market, the bank is permitted to request a determination from the applicable regional office that the bank is operating in a high-rate area.

Examiners should review conformance with interest rate restrictions during examinations of banks that are not well capitalized. If a bank has not received a determination that it is operating in a high-rate area, deposit rates must not exceed the national rate caps posted on the FDIC website. If an institution receives a determination that it is operating in a high-rate area, the institution can establish its market area based on its branch locations and marketing scope. The deposit rates of all FDIC-insured institutions inside the market area must be used when calculating the prevailing rate. An institution may also include as part of its prevailing rate calculation the rates offered by credit unions that the institution competes with inside its local market area. When using the local market approach, the rate cap for local deposits cannot exceed the prevailing rate of the local market plus 75 basis points. Deposits accepted outside the market area are subject to the national rate caps, even for institutions that have received a determination they are operating in a high-rate area. While in some cases the FDIC may grant a brokered deposit waiver to a less than well-capitalized bank, the FDIC may not waive the interest rate restrictions under the brokered deposit regulations.

Brokered Deposits Use

The FDI Act does not restrict the use of brokered deposits for well-capitalized institutions, and brokered deposits can be a suitable funding source when properly managed. However, some banks have used brokered deposits to fund unsound or rapid expansion of loan and investment portfolios, which has contributed to weakened financial and liquidity positions over successive economic cycles. The overuse and failure to properly manage brokered deposits by problem institutions have contributed to bank failures and losses to the deposit insurance fund.

Examiners should consider whether an institution's policies adequately describe permissible brokered and rate-sensitive funding types, amounts, and concentration limits. Key policy considerations include procedures for assessing potential risks to earnings and capital associated with brokered and rate-sensitive deposits, and monitoring how such funds are used. Examiners should ensure management is aware of the restrictions that may apply if the institution's PCA capital category falls below well capitalized.

Examiners should determine whether management performs adequate due diligence before entering any business relationship with a deposit broker or other business partners that help provide rate-sensitive deposits, such as deposit listing services. Deposit brokers and deposit listing services are not regulated by the federal bank agencies.

While the FDI Act does not restrict the use of brokered deposits by well-capitalized institutions, the acceptance of brokered deposits by well-capitalized institutions is subject to the same considerations and concerns applicable to any type of special funding. These considerations relate to volume, availability, cost, volatility, maturity, and how the use of such special funding fits into the institution's overall liability and liquidity management plans.

When brokered deposits are encountered in an institution, examiners should consider the effect on overall funding and investment strategies and if the bank is less than well capitalized, verify compliance with Part 337. Examiners should also consider the source, stability, and use of brokered deposits or rate sensitive funding sources that support asset growth or individual loans. Appropriate supervisory action should be considered if brokered deposits or other rate sensitive funding sources are not appropriately managed as part of an overall, prudent funding strategy. Apparent violations of Part 337 or nonconformance with the Interagency Guidelines Establishing Standards for Safety and Soundness (Appendix A to Part 364) should be discussed with management and the board of directors, and appropriately addressed in the ROE.

Public Funds

Public funds are deposits of government entities such as state or local municipalities. Some states require institutions to secure the uninsured or entire balance of these accounts. Although various forms of collateral may be pledged, high-quality assets such as securities of U.S. government or government-sponsored enterprises (GSE) are most commonly pledged. Some institutions may also use standby letters of credit (SBLCs), such as those from one of the Federal Home Loan Banks (FHLB), to secure public funds.

The stability of public fund accounts can vary significantly due to several factors. Account balances may fluctuate due to timing differences between tax collections and expenditures, the funding of significant projects (e.g., school or hospital construction), placement requirements, and economic conditions. Placement requirements may include rotating deposits between institutions in a particular community, obtaining bids and placing funds with the highest bidder, and minimum condition standards for the institution receiving the deposits (such as specific capital levels or the absence of formal enforcement actions). Economic conditions can affect the volatility of public deposits since public entities may experience lower revenues during an economic downturn.

Although public deposit accounts often exhibit volatility, the accounts can be reasonably stable over time, or their fluctuations quite predictable. Therefore, examiners should closely review public deposit relationships to make informed judgments as to the stability of the balances.

Securing Public Funds with SBLCs

Some financial institutions obtain SBLCs as a supplemental funding source to accommodate public depositors, derivative counterparties, and corporate borrowing needs. Typically, institutions obtain SBLCs from their district FHLB to support uninsured public deposits and secure them with eligible loans and securities. The SBLC guarantees that the issuer will pay the beneficiary on demand if the institution fails or otherwise defaults on its obligation. When used judiciously, these standby credit facilities can complement a diversified funds management program and serve as a practical, cost-effective solution for securing a financial institution's obligations.

Certain state laws require public deposits from state, county, and municipal authorities be protected by federal deposit insurance; a pledge of obligations issued by the U.S. Treasury, U.S. government agencies, or state and local governments; or an SBLC issued by an FHLB. Some institutions prefer to obtain an SBLC rather than pledge government securities because of the standby facility's cost and balance sheet efficiency. FHLBs will accept a variety of loans and securities as collateral subject to certain collateral requirements, or "haircuts."

Similar to FHLB advances or other secured borrowings, SBLCs require collateral. Most institutions depend on eligible loans or securities as collateral. To maximize balance sheet efficiency, institutions frequently secure SBLCs with loans because they would otherwise use unencumbered securities to directly meet pledging requirements (especially for uninsured public deposits). While secured borrowings are a widely accepted form of funding that can be performed in a safe and sound manner, undiversified reliance on secured borrowings or less stable funding can sometimes result in strained liquidity. Funding diversification is important in the case of large-scale secured borrowing programs which can encumber assets that would otherwise be eligible for pledging or conversion to cash. Importantly, funding risk does not arise because of the type of secured borrowing conducted (i.e., FHLB advances or SBLCs); rather, it centers on the extent of borrowing, leveraging previously unencumbered assets, and over-reliance on non-core sources to achieve growth or earnings targets.

SBLCs are generally only exercised by public depositors if the institution fails to fund a withdrawal. If an institution does not have sufficient unencumbered liquid assets to meet a withdrawal request, it may seek a new FHLB advance and contemporaneously cancel or reduce the SBLC. The assets used to collateralize the SBLC would secure at least part of the new advance, depending on the FHLB's revised collateral terms. The FHLB can require additional collateral, possession of collateral, or limits on availability if it views an institution as troubled.

Examiners should recognize that SBLCs may present challenges in times of stress, particularly when an institution's borrowing capacity may be constrained by a large volume of pledged loans and securities. SBLCs encumber assets eligible for FHLB collateral at the time of commitment and throughout the instrument's life, meaning that pledged assets will not be as readily convertible to cash or available to use as collateral for additional borrowings. Further, if an institution's asset quality or financial condition deteriorates, the FHLB may demand more rigorous terms or additional collateral. This may occur precisely when an institution has a heightened need for on-balance sheet liquidity.

Liquidity reviews during examinations should consider the potential impact of standby credit facilities on liquidity and funds management, asset encumbrance, and the protection of uninsured public deposits. Examiners should identify SBLC or other credit facilities that require pledged collateral, followed by a review of related documentation and financial reporting. If an institution relies significantly on wholesale borrowings (such as FHLB advances and SBLCs) to fund its balance sheet, examiners should analyze how asset encumbrances might impair liquidity in a stress scenario and whether these issues are appropriately addressed in the CFP.

Secured and Preferred Deposits

Institutions are usually required to pledge securities (or other readily marketable assets) to cover secured and preferred deposits. Institutions must secure U.S. government deposits, and many states require banks to secure public funds, trust accounts, and bankruptcy court funds. In addition to strict regulatory and bookkeeping controls associated with pledging requirements, institutions often establish monitoring controls to ensure deposits and pledged assets are appropriately considered in their liquidity analysis. Accurate accounting for secured or preferred liabilities is also important if an institution fails, because secured depositors and creditors may gain immediate access to some of the institution's most liquid assets.

Large Depositors and Deposit Concentrations

For examination purposes, a large depositor is a customer or entity that owns or controls 2 percent or more of the bank's total deposits. Some large deposits remain relatively stable over long periods. However, due to the effect the loss of a large deposit account could have on an institution's overall funding position, these deposits are considered to be potentially less stable liabilities.

A large deposit account might be considered stable if the customer has ownership in the institution, has maintained a long-term relationship with the bank, has numerous accounts, or uses multiple bank services. Conversely, a large depositor that receives a high deposit rate, but maintains no other relationships with the institution, may move the account quickly if the rate is no longer considered high for the market. Therefore, examiners should consider the overall relationship between customers and the institution when assessing the stability of large deposits.

Examiners should consider whether institutions actively monitor the stability of large deposits and maintain funds management policies and strategies that reflect consideration of potentially volatile concentrations and significant deposits that mature simultaneously. Key considerations include potential cash flow fluctuations, pledging requirements, affiliated relationships, and the narrow interest spreads that may be associated with large deposits.

Negotiable Certificates of Deposit

Negotiable CDs warrant special attention as a component of large (uninsured) deposits. These instruments are usually issued by large regional or money center banks in denominations of $1 million or more and may be issued at face value with a stated rate of interest or at a discount similar to U.S. Treasury bills. Major bank CDs are widely traded, may offer substantial liquidity, and are the underlying instruments for a market in financial futures. Their cost and availability are closely related to overall market conditions, and any adverse publicity involving either a particular bank or banks in general can impact the CD market. These CDs have many features similar to borrowings and can be quite volatile.

Assessing the Stability of Funding Sources

Assessing the stability of funding sources is an essential part of liquidity risk measurement and liquidity management. Institutions may rely on a variety of funding sources, and a wide array of factors may impact the stability of those funding sources. The following factors should be considered when assessing the stability of funding sources:

- **The cost of the bank's funding sources compared to market costs and alternative funding sources:** If a bank pays significantly above local or national rates to obtain or retain deposits, the bank's deposit base may be highly cost sensitive, and depositors may be more likely to move deposits if terms become more favorable elsewhere. Examiners should determine whether the institution uses rate specials or one-time promotional offerings to obtain deposits or to retain rate-sensitive customers. Examiners should also assess how much of the deposit base consists of rate specials and determine if management measures and reports the level of such deposits.

- **Large deposit growth or large changes in deposit composition:** Strategies that rely on less stable funding sources to fund significant growth in new business lines should be carefully considered. The potential for misjudging the level of risk in new strategies is high and could be compounded with the use of volatile funding sources.
- **Stability of insured deposits and fully secured borrowings:** Insured deposits and borrowings secured by highly liquid assets are more likely to be stable than uninsured deposits or borrowings secured by non-liquid assets. Uninsured deposits should not automatically be considered volatile; however, the historical and projected stability of uninsured deposits should be assessed.
- **The current rate environment:** Depositors may be less rate sensitive in a low-rate environment due to the limited benefits (marginally higher rates) obtained by shifting deposits into longer-term investments.
- **The current business cycle:** If the national or local economy is in a downward cycle, individuals and businesses may decide to keep more cash on hand versus spending or investing it.
- **Contractual terms and conditions:** Terms and requirements related to the condition of the bank, such as the bank's PCA category, credit ratings, or capital levels can materially affect liquidity. Specific contractual terms and conditions are often associated with brokered deposits, funds from deposit listing services, correspondent bank accounts, repurchase agreements, and FHLB advances.
- **The relationship with the funding source:** Large deposits might be more stable if the deposit is difficult to move (e.g., the deposit is in a transaction account used by a payroll provider), if the depositor is an insider in the institution, or if the depositor has a long history with the institution. However, examiners should consider that depositors may withdraw funds during stress periods regardless of difficulties or the effect on the bank.

Borrowings

Stable deposits are a key funding source for most insured depository institutions; however, institutions are becoming increasingly reliant upon borrowings and other wholesale funding sources to meet their funding needs. Borrowings include debt instruments or loans that banks obtain from other entities such as correspondent lines of credit, federal funds, and FHLB and Federal Reserve Bank advances.

Generally, examiners should view borrowings as a supplemental funding source, rather than as a replacement for core deposits. If an institution is using borrowed funds to meet contingent liquidity needs, examiners should determine whether management understands the associated risks and has commensurate risk management practices. Effective practices typically include a comprehensive contingency funding plan that specifically addresses funding plans if the institution's financial condition or the economy deteriorates. Active and effective risk management, including funding-concentration management by size and source, can mitigate some of the risks associated with the use of borrowings.

Key considerations when assessing liquidity risks associated with borrowed funds include the following:

- Pledging assets to secure borrowings can negatively affect a bank's liquidity profile by reducing the amount of securities available for sale during periods of stress.
- Unexpected changes in market conditions can make it difficult for the bank to secure funds and manage its funding maturity structure.
- It may be more difficult to borrow funds if the institution's condition or the general economy deteriorates.
- Banks may incur relatively high costs to obtain funds and may lower credit quality standards in order to invest in higher-yielding loans and securities to cover the higher costs. If a bank incurs higher-cost liabilities to support assets already on its books, the cost of the borrowings may result in reduced or negative net income.
- Preoccupation with obtaining funds at the lowest possible cost, without proper consideration given to diversification and maturity distribution, intensifies a bank's exposure to funding concentrations and interest rate fluctuations.
- Some borrowings have embedded options that make their maturity or future interest rate uncertain. This uncertainty can increase the complexity of liquidity management and may increase future funding costs.

Common borrowing sources include:

- Federal funds purchased,
- Federal Reserve Bank facilities,
- Repurchase agreements,
- Dollar repurchase agreements,
- Bank investment contracts,
- Commercial Paper, and
- International funding sources.

Federal Funds

Federal funds are reserves held in an institution's Federal Reserve Bank account that can be lent (sold) by institutions with excess reserves to other institutions with an account at a Federal Reserve Bank. Institutions borrow (purchase) federal funds to meet their reserve requirements or other funding needs. Institutions rely on the Federal Reserve Bank or a correspondent bank to facilitate federal funds transactions. State non-member banks that do not maintain balances at the Federal Reserve purchase/sell federal funds through a correspondent bank.

Lending and borrowing these balances has become a convenient method for banks to avoid reserve deficiencies or invest excess reserves over a short period of time. In most instances, federal funds transactions take the form of overnight or short-term unsecured transfers of immediately available funds between banks. However, banks also enter into continuing contracts that have no set maturity but are subject to cancellation upon notice by either party to the transaction. Banks also engage in federal funds transactions of a set maturity, but these include only a small percentage of all federal funds transactions. In any event, these transactions should be supported with written verification from the lending institution.

Some institutions may access federal funds as a liability management technique to fund a rapid expansion of its loan or investment portfolios and enhance profits. In these situations, examiners should determine whether appropriate board approvals, limits, and policies are in place and should discuss with management and the board the institution's plans for developing appropriate long-term funding solutions. Liquidity risks typically decline if institutions avoid undue reliance on federal funds purchased, as the funds are usually short-term, highly credit sensitive instruments that may not be available if an institution's financial condition deteriorates.

Federal Reserve Bank Facilities

The Federal Reserve Banks provide short-term collateralized credit to banks through the Federal Reserve's discount window. The discount window is available to any insured depository institution that maintains deposits subject to reserve requirements. The most common types of collateral are U.S. Treasury securities; agency, GSE, mortgage-backed, asset-backed, municipal, and corporate securities; and commercial, agricultural, consumer, residential real estate, and commercial real estate loans. Depending on the collateral type and the condition of the institution, collateral may be transferred to the Federal Reserve, held by the borrower in custody, held by a third party, or reflected by book entry.

Types of discount window credit include primary credit (generally overnight credit to meet temporary liquidity needs), secondary credit (available to institutions that do not qualify for primary credit), seasonal credit (available to banks that demonstrate a clear seasonal pattern to deposits and assets), and emergency credit (rare circumstances).

The Federal Reserve's primary credit program was designed to ensure adequate liquidity in the banking system and is intended as a back-up of short-term funds for eligible institutions. In general, depository institutions are eligible for primary credit if they have a composite CAMELS rating of 1, 2, or 3 and are at least adequately capitalized.

Since primary credit can serve as a viable source of back-up, short-term funds, examiners should not automatically criticize the occasional use of primary credit. At the same time, over-reliance on primary credit borrowings or any one source of short-term contingency funds may indicate operational or financial difficulties. Examiners should consider whether institutions that use primary credit facilities maintain viable exit strategies.

Secondary credit is available to depository institutions that do not qualify for primary credit and is extended on a very short-term basis at a rate above the primary credit rate. This program entails a higher level of Reserve Bank administration and oversight than primary credit.

If a bank's borrowing becomes a regular occurrence, Federal Reserve Bank officials will review the purpose of the borrowing and encourage the bank to initiate a program to eliminate the need for such borrowings. Appropriate reasons for borrowing include preventing overnight overdrafts, loss of deposits or borrowed funds, unexpected loan demand, liquidity and cash flow needs, operational or computer problems, or a tightened federal funds market.

The Federal Reserve will not permit banks that are not viable to borrow at the discount window. Section 10B(b) of the Federal Reserve Act limits Reserve Bank advances to not more than 60 days in any 120-day period for undercapitalized institutions or institutions with a composite CAMELS rating of 5. This limit may be overridden only if the primary federal banking agency supervisor certifies the borrower's viability or if, following an examination of the borrower by the Federal Reserve, the Chairman of the Board certifies in writing to the Reserve Bank that the borrower is viable. These certifications may be renewed for additional 60-day periods.

Repurchase Agreements

In a securities repurchase agreement (repo), an institution agrees to sell a security to a counterparty and simultaneously commits to repurchase the security at a mutually agreed upon date and price. In economic terms, a repurchase agreement is a form of secured borrowing. The amount borrowed against the securities generally is the full market value less a reasonable discount. Typically, the securities do not physically change locations or accounting ownership; instead, the selling bank's safekeeping agent makes entries to recognize the purchasing bank's interest in the securities.

From an accounting standpoint, repurchase agreements involving securities are either reported as secured borrowings, or sales and a forward repurchase commitment based on whether the selling institution maintains control over the transferred financial asset. Generally, if the repurchase agreement both entitles and obligates the selling bank to repurchase or redeem the transferred assets from the transferee (i.e., the purchaser) the selling bank should report the transaction as a secured borrowing if various other conditions outlined in Generally Accepted Accounting Principles have been met. If the selling bank does not maintain effective control of the transferred assets according to the repurchase agreement, the transaction would be reported as a sale of the securities and a forward repurchase commitment. For further information, see the Call Report Glossary entries pertaining to Repurchase/Resale Agreements and Transfers of Financial Assets.

Examiners may encounter two types of repurchase agreements: bilateral and tri-party. Bilateral repurchase agreements involve only two parties. In tri-party repurchase agreements, an agent is involved in matching counterparties, holding the collateral, and ensuring the transactions are executed properly.

The majority of repurchase agreements mature in three months or less. One-day transactions are known as overnight repos, while transactions longer in duration are referred to as term repos. Institutions typically use repurchase agreements as short-term, relatively low cost, funding mechanisms. The interest rate paid on a repurchase agreement depends on the type of underlying collateral. In general, the higher the credit quality of the collateral and the easier the security is to deliver and hold, the lower the repo rate. Supply and demand factors for the underlying collateral also influence the repo rate.

Properly administered repurchase agreements conducted within a comprehensive asset/liability management program are not normally subject to regulatory criticism. However, repos that are inadequately controlled can expose an institution to risk of loss and may be regarded as an unsuitable investment practice. Since the fair value of the underlying security may change during the term of the transaction, both parties to a repo may experience credit exposure. Although repo market participants normally limit credit exposures by maintaining a cushion between the amount lent and the value of the underlying collateral, and by keeping terms short to allow for redemption as necessary, it is critical to conduct a thorough credit review of repo counterparties prior to the initiation of transactions. The Policy Statement on Repurchase Agreements of Depository Institutions with Securities Dealers and Others, dated February 10, 1998, provides additional information on repurchase agreements, associated policies and procedures, credit risk management practices, and collateral management practices.

A reverse repurchase agreement, which requires the buying institution to sell back the same asset purchased, is treated as a loan for Call Report purposes. If the reverse repurchase agreement does not require the institution to resell the same, or a substantially similar, security purchased, it is reported as a purchase of the securities and a commitment to sell securities.

Reverse repos can involve unique risks and complex accounting and recordkeeping challenges, and institutions can benefit from establishing appropriate risk management policies, procedures and controls. In particular, institutions can benefit from controls when relying on reverse repos that are secured with high-risk assets. The value of the underlying assets may decline significantly in a stress event, creating an undesirable amount of exposure.

Dollar Repurchase Agreements

Dollar repurchase agreements, also known as dollar repos and dollar rolls, provide financial institutions with an alternative method of borrowing against securities owned. Unlike standard repurchase agreements, dollar repos require the buyer to return substantially similar, versus identical, securities to the seller. Dealers typically offer dollar roll financing to institutions as a means of covering short positions in particular securities. Short positions arise when a dealer sells securities that it does not currently own for forward delivery. To compensate for potential costs associated with failing on a delivery, dealers are willing to offer attractive financing rates in exchange for the use of the institution's securities in covering a short position. Savings associations, which are the primary participants among financial institutions in dollar roll transactions, typically use mortgage pass through securities as collateral for the transactions.

Supervisory authorities do not normally take exception to dollar repos if the transactions are conducted for legitimate purposes and the institution has instituted appropriate controls.

Bank Investment Contracts

A bank investment contract (BIC) is a deposit contract between a bank and a customer that permits the customer to deposit funds over a period of time and obligates the bank to repay the amounts deposited plus interest at a guaranteed rate at the end of the contract term. Contract terms vary and may include maturities ranging from six months to ten years. Occasionally, BICs have been structured as non-transferable liabilities (i.e., not saleable in a secondary market). Customers for BICs are often sponsors of employee benefit plans such as pension plans or deferred compensation plans.

Examiners should consider the volume, maturity, and cost of BIC funding in relation to the bank's other deposit and non-deposit funding sources. Examiners should also be aware of the terms and conditions of the BICs. A BIC may provide specific periods and conditions under which additional deposits or withdrawals can be made to or from such accounts. The bank's liquidity planning typically estimate cash flows from BIC funding under different interest rate scenarios.

International Funding Sources

International funding sources exist in various forms. The most common source of funds is the Eurodollar market. Eurodollar deposits are U.S. dollar-denominated deposits taken by a bank's overseas branch or its international banking facility. Reserve requirements and deposit insurance assessments do not apply to Eurodollar deposits. The interbank market is highly volatile, and banks typically benefit form analyzing Eurodollar deposit activities within the same context as all other potentially volatile funding sources.

Commercial Paper

Institutions can issue commercial paper to quickly raise funds from the capital markets. Commercial paper is generally a short-term, negotiable promissory note issued for short-term funding needs by a bank holding company, large commercial bank, or other large commercial business. Commercial paper usually matures in 270 days or less, is not collateralized, and is purchased by institutional investors.

Some commercial paper programs are backed by assets referred to as asset-backed commercial paper. Some programs also involve multi-seller conduits where a special-purpose entity is established to buy interests in pools of financial assets (from one or more sellers). Entities fund such purchases by selling commercial paper notes, primarily to institutional investors.

Institutions that provide liquidity lines or other forms of credit enhancement to their own or outside commercial paper programs face the risk that the facilities could be drawn upon during a crisis situation. Prudent institutions plan for such events and include such events in stress scenario analysis and contingency plans. In addition, institutions benefit from addressing the bank's ability to continue using commercial paper conduits as a funding source in the bank's contingency funding plan.

←

OFF-BALANCE SHEET ITEMS

Off-balance sheet items, such as those described below, can be a source or use of funds.

Loan Commitments

Loan commitments are common off-balance sheet items. Typical commitments include unfunded commercial, residential, and consumer loans; unfunded lines of credit for commercial and retail customers; and fee-paid, commercial letters of credit. Sound risk management practices include closely monitoring the amount of unfunded commitments that require funding over various periods and detailing anticipated demands against unfunded commitments in internal reports and contingency plans. Examiners should consider the nature, volume, and anticipated use of the institution's loan commitments when assessing and rating the liquidity position.

Derivatives

Financial institutions can use derivative instruments (financial contracts that generally obtain their value from underlying assets, interest rates, or financial indexes) to reduce business risks. However, like all financial instruments, derivatives contain risks that must be properly managed. For example, interest rate swaps typically involve the periodic net settlement of swap payments that can substantially affect an institution's cash flows. Additionally, derivative contracts may have initial margin requirements that require an institution to pledge cash or investment securities that reflect a specified percentage of the contract's notional value. Variation margin requirements (which may require daily or intra-day settlements to reflect changes in market value) can also affect an institution's cash flows and investment security levels. Examiners should consider the extent to which banks engaging in derivative activities understand and manage the liquidity, interest rate, and price risks of these instruments.

Other Contingent Liabilities

Legal risks can have a significant financial impact on institutions that may affect liquidity positions. Examiners should consider whether institutions identify these contingencies when measuring and reporting liquidity risks as exposures become more certain.

←

LIQUIDITY RISK MITIGATION

There are many ways management can mitigate liquidity risk and maintain the institution's current and future liquidity positions within the risk tolerance targets established by the board. For managing routine and stressed liquidity needs, institutions typically establish diversified funding sources and maintain a cushion of high-quality liquid assets. Examiners should consider whether contingency funding plans identify back-up funding sources (and action steps to address more acute liquidity needs) and whether management tests various stress scenarios to identify risks that should be mitigated and addressed in contingency funding plans.

Diversified Funding Sources

An important component of liquidity management is the diversification of funding sources. Undue reliance on any one source of funding can have adverse consequences in a period of liquidity stress. Banks typically diversify funding across a range of retail sources and, if utilized, across a range of wholesale sources, consistent with the institution's sophistication and complexity. Institutions that rely primarily on retail deposit accounts are generally not criticized for relying on one primary funding source. However, examiners should determine whether alternative sources are identified in formal contingency plans and periodically tested.

To reduce risks associated with funding concentrations, banks generally benefit from considering the correlations between sources of funds and market conditions and having available a variety of short-, medium-, and long-term funding sources. The board is responsible for setting and clearly articulating a bank's risk tolerance in this area through policy guidelines and limits for funding diversification.

Although banks use diversified funding sources to reduce funding concentration risks, banks also consider other factors when selecting funding sources. For example, the cost of a particular funding source is a critical consideration when developing profitability strategies. Additionally, the stability and availability of a funding source are important factors when planning for asset growth. Examiners should carefully assess strategies that rely on less-stable funding sources, particularly strategies that fund significant growth in new business lines.

When assessing the diversification of funding sources, important factors to consider include:

- Internal evaluations of risks associated with funding sources (e.g., stress tests and diversification limits) and whether or not the evaluations are reasonable and well documented,
- Potential curtailment of funding or significantly higher funding costs during periods of stress,
- Time required to access funding in stressed and normal periods,
- Sources and uses of funds during significant growth periods, and
- Available alternatives to volatile funding sources.

Maintaining market access to funds is also an essential component of ensuring funding diversity. Market access can be critical, as it affects an institution's ability to raise new funds and to liquidate assets. Examiners should consider whether management actively manages, monitors, and tests the institution's market access to funds. Such efforts should be consistent with the institution's liquidity risk profile and sources of funding. For example, access to the capital markets is an important consideration for most large complex banks, whereas the availability of correspondent lines and other sources of wholesale funds are critical for community banks. Reputation risk plays a critical role in a bank's ability to access funds readily and at reasonable terms. For this reason, examiners should determine whether liquidity risk managers are aware of any information, such as an announcement of a decline in earnings, or a downgrade by a rating agency, that could affect perceptions of an institution's financial condition.

The Role of Equity

Issuing new equity is often a relatively slow and costly way to raise funds and should not be viewed as an immediate or direct source of liquidity. However, to the extent that a strong capital position helps an institution quickly obtain additional debt and economically raise funds, issuing equity can be considered a liquidity facilitator.

Cushion of Highly Liquid Assets

One of the most important components of an institution's ability to effectively respond to liquidity stress is the availability of unencumbered, highly liquid assets (i.e., assets free from legal, regulatory, or operational impediments). Unencumbered liquid assets can be sold or pledged to obtain funds under a range of stress scenarios. The quality of the assets is a critical consideration, as it significantly affects a bank's ability to sell or pledge the assets in times of stress.

When determining what type of assets to hold for contingent liquidity purposes, management typically considers factors such as:

- **Level of credit and market risk:** Assets with lower levels of credit and market risk tend to have higher liquidity profiles.
- **Liquidity during stress events:** High-quality liquid assets are generally not subject to significantly increased risk during stress events. Conversely, certain assets, such as specialty assets with small markets or assets from industries experiencing stress, are often less liquid in times of stress in the banking sector.
- **Ease and certainty of valuation:** Prices based on trades in sizeable and active markets tend to be more reliable, and an asset's liquidity increases if market participants are more likely to agree on its valuation. Formula-based pricing is less desirable than data from recent trades. If used, the pricing formula should be easy to calculate, based on active trades, and not depend heavily on assumptions or modeled prices. The inputs into the pricing formula should also be publicly available.

Institutions with high quality liquid assets are generally able to monetize the assets through the sale of the assets or the use of secured borrowings. This generally means an institution's cushion of liquid assets is concentrated in due from accounts, federal funds sold, and high-quality assets, such as U.S. Treasury securities or GSE bonds.

Occasionally, it may be appropriate to consider pledged assets as part of the highly liquid cushion, such as when a bank pledges Treasury notes as part of an unfunded line of credit. In other instances, it may be appropriate to consider an asset that has not been explicitly pledged as illiquid. For example, if an institution is required to deposit funds at a correspondent institution to facilitate operational services, it should generally exclude these funds from its liquidity reports, or denote them separately as unavailable.

Examiners should assess whether the size of the institution's liquid asset cushion is aligned with its risk tolerance and profile, and is supported by documented analysis and stress test results. Factors that may indicate a need to maintain a higher liquid asset buffer include:

- Easy customer access to alternative investments,
- Recent trends showing substantial reductions in large liability accounts,
- Significant volumes of less-stable funding,
- High levels of assets with limited marketability (due to credit quality issues or other factors),
- Expectations of elevated draws on unused lines of credit or loan commitments,
- A concentration of credit to an industry with existing or anticipated financial problems,
- Close ties between deposit accounts and employers experiencing financial problems,
- A significant volume of assets are pledged to wholesale borrowings, and
- Impaired access to funds from capital markets.

CONTINGENCY FUNDING

Contingency Funding Plans

All financial institutions, regardless of size or complexity, benefit from a formal contingency funding plan (CFP) that clearly defines strategies for addressing liquidity shortfalls in emergency situations. Comprehensive CFPs delineate policies to manage a range of stress environments, establish clear lines of responsibility, and articulate clear implementation and escalation procedures. The reliability of a CFP improves if it is regularly tested and updated to ensure that it is operationally sound. Often, financial institutions coordinate liquidity risk management plans with disaster, contingency, and business planning efforts, as well as with business line and risk management objectives, strategies, and tactics.

While CFPs should be tailored to the business model, risk, and complexity of the individual institution, most CFPs require management to:

- Establish a liquidity event-management framework (including points of contact and public relation plans),
- Establish a monitoring framework,
- Identify potential contingent funding events,
- Identify potential funding sources,
- Require stress testing, and
- Require periodic testing of the CFP framework.

Contingent Funding Events

The primary goals of most CFPs are to identify risks from contingent funding events and establish an operational framework to deal with those risks. Contingent funding events are often managed based on their probability of occurrence and potential effect. CFPs generally focus on events that, while relatively infrequent, could have a high-impact on the bank's operations. Appropriate plans typically set a course of action to identify, manage, and control all significant contingent funding risks.

Stress factors that may provide early warning signs for identifying potential funding risks can be institution-specific or systemic and may involve one or more of the following:

- Deterioration in asset quality,
- Downgrades in credit ratings,
- Downgrades in PCA capital category,
- Deterioration in the liquidity management function,
- Widening of credit default spreads,
- Operating losses,
- Rapid growth,
- Inability to fund asset growth,
- Inability to renew or replace maturing funding liabilities,
- Price volatility or changes in the market value of various assets,
- Negative press coverage,
- Declining institution equity prices,
- Deterioration in economic conditions or market perceptions,
- Disruptions in the financial markets, and
- General or sector-specific market disruptions (e.g., payment systems or capital markets).

Stress events can also be caused by counterparties (both credit and non-credit exposures). For example, if a bank sells financial assets to correspondent banks for securitization and its primary correspondent exits the market, the bank may need to use a contingent funding source.

Comprehensive CFPs identify institution-specific events that may impact on- and off-balance sheet cash flows given the specific balance-sheet structure, business lines, and organizational structure. For example, institutions that securitize loans have CFPs that consider a stress event where the institution loses access to the market but must still honor its commitments to customers to extend loans.

Comprehensive CFPs also delineate various stages and severity levels for each potential contingent liquidity event. For example, asset quality can deteriorate incrementally and have various levels of severity, such as less than satisfactory, deficient, and critically deficient. The CFPs also address the timing and severity levels of temporary, intermediate-term, and long-term disruptions. For example, a natural disaster may cause temporary disruptions to payment systems, while deficient asset quality may occur over a longer term. Institutions can then use the stages or severity levels identified to establish various stress test scenarios and early-warning indicators.

Stress Testing Liquidity Risk Exposure

After identifying potential stress events, institutions often implement quantitative projections, such as stress tests, to assess the liquidity risk posed by the potential events. Stress testing helps the institution better understand the vulnerability of certain funding sources to various risks and helps to determine when and how to access alternative funding sources. Stress testing also helps institutions identify methods for rapid and effective responses, guide crisis management planning, and determine how large of a liquidity buffer should be maintained. Generally, the magnitude and frequency of stress testing is commensurate with the complexity of the financial institution and the level of its risk exposures.

Liquidity stress tests are typically based on existing cash-flow projections that are appropriately modified to reflect potential stress events (institution-specific or market-wide) across multiple time horizons. Stress tests are used to identify and quantify potential risks and to analyze possible effects on the institution's cash flows, liquidity position, profitability, and solvency. For instance, during a crisis an institution's liquidity needs can quickly escalate while liquidity sources can decline (e.g., customers may withdraw uninsured deposits, or lines of credit may be reduced or canceled). Stress testing allows an institution to evaluate the possible impact of these events and plan accordingly.

Examiners should review documented assumptions regarding the cash flows used in stress test scenarios and consider whether they incorporate:

- Customer behaviors (early deposit withdrawals, renewal/run-off of loans, exercising options);
- Prepayments on loans and mortgage-backed securities;
- Seasonality (public-fund fluctuations, agricultural credits, construction lending); and
- Various time horizons.

Effective assumptions generally incorporate both contractual and non-contractual behavioral cash flows, including the possibility of funds being withdrawn. Examples of non-contractual funding requirements that may occur during a financial crisis include supporting auction rate securities, money market funds, commercial paper programs, and structured investment vehicles. Institutions may be compelled to financially bolster shortfalls in money market funds or asset-backed paper that does not sell or roll due to market stress, and assets may be taken on balance sheet from sponsored off-balance sheet vehicles. While this financial support is not contractually required, institutions may determine that the negative press and reputation risks outweigh the costs of providing the financial support.

Effective stress testing generally assesses various stress levels and stages ranging from low- to severe-stress scenarios. To establish appropriate stress scenarios, management may use the different stages and severity levels that the institution assigned to stress events. For example, a low-stress scenario may include several events identified as low severity, while a severe stress scenario may combine several high-severity events. A severe stress scenario may include severe declines in asset quality, financial condition, and PCA category.

Management's active involvement and support is critical to the effectiveness of the stress testing process. Stress test results are typically discussed with the board, and when appropriate, management takes remedial actions to limit the institution's exposures, build up a liquidity cushion, and/or adjust its liquidity profile to fit its risk tolerance. In some situations, institutions may adjust the bank's business strategy to mitigate a contingent funding exposure.

Potential Funding Sources

Identification of potential funding sources for shortfalls resulting from stress scenarios is a key component of adequate contingency funding plans. Banks generally identify alternative funding sources and ensure ready access to the funds. The most important and reliable funding source is a cushion of highly liquid assets. Other common contingent funding sources include the sale or securitization of assets, repurchase agreements, FHLB borrowings, or borrowings though the Federal Reserve discount window. However, in a stress event, many of these liquidity sources may become unavailable or cost prohibitive. Therefore, effective stress tests typically assess the availability of contingent funding in stress scenarios.

Institutions that rely on unsecured borrowings for contingency funding normally consider how borrowing capacity may be affected by an institution-specific or market-wide disruption. Institutions that rely upon secured funding sources for contingency funding also consider whether they may be subject to higher margin or collateral requirements in certain stress scenarios. Higher margin or collateral requirements may be triggered by the deterioration in the institution's overall financial condition or in a specific portfolio.

Potential collateral values are also normally subjected to stress tests because devaluations or market uncertainties could reduce the amount of contingent funding available from a pledged asset. Similarly, stress tests often consider correlation risk when evaluating margin and collateral requirements. For example, if an institution relies on its loan portfolio for contingent liquidity, a stress test may assess the effects of poor asset quality. If loans previously securitized were of poor credit quality, the market value and collateral value of current and future loans originated by the bank could be significantly reduced.

Monitoring Framework for Stress Events

Early identification of liquidity stress events is critical to implementing an effective response. The early recognition of potential events allows the institution to position itself into progressive states of readiness as an event evolves, while providing a framework to report or communicate within the institution and to outside parties. As a result, effective CFPs typically identify early warning signs that are tailored to the institution's specific risk profile. The CFPs also establish a monitoring framework and responsibilities for monitoring identified risk factors.

Early warning indicators may be classified by management as early-stage, low-severity, or moderate-severity stress events and include factors such as:

- Decreased credit-line availability from correspondent institutions,
- Demands for collateral or higher collateral requirements from counterparties that provide credit to the institution,
- Cancelation of loan commitments or the non-renewal of maturing loans from counterparties that provide credit to the institution,
- Decreased availability of warehouse financing for mortgage banking operations,
- Increased trading of the institution's debt, or
- Unwillingness of counterparties or brokers to participate in unsecured or long-term transactions.

Testing of Contingency Funding Plans

Institutions periodically test and update the CFP to assess the plan's reliability under times of stress. Generally, management tests contingent funding sources at least annually. Testing may include both drawing on a contingent borrowing line and operational testing. Operational testing is often designed to ensure that:

- Roles and responsibilities are up to date and appropriate,

- Legal and operational documents are current and appropriate,
- Cash and collateral can be moved where and when needed, and
- Contingent liquidity lines are available.

Effective CFP testing typically includes periodically testing the operational elements associated with accessing contingent-funding sources. The tests help ensure funds are available when needed. For example, there may be extended time constraints for establishing lines with the Federal Reserve or FHLB, and often, the lines are set up in advance to establish availability and to limit the time required to pledge assets and draw on lines. However, examiners should understand that establishing lines in advance and testing the lines does not guarantee funding sources will be available within the same time frames or on the same terms during stress events.

In addition, institutions can benefit by employing operational CFP simulations to test communications, coordination, and decision making involving managers with different responsibilities, in different geographic locations, or at different operating subsidiaries. Simulations or tests run late in the day can highlight specific problems such as difficulty in selling assets or borrowing new funds at a time when the capital markets may be less active. The complexity of these tests can range from a simple communication and access test for a non-complex bank or can include multiple tests throughout the day to assess the timing of funds access.

Liquidity Event Management Processes

In a contingent liquidity event, it is critical that management's response be timely, effective, and coordinated. Therefore, comprehensive CFPs provide for a dedicated crisis management team and administrative structure, and include realistic action plans to execute the various elements of the plan for various levels of stress. The CFPs establish clear lines of authority and reporting by defining responsibilities and decision-making authority. The CFPs also address the need for more frequent communication and reporting among team members, the board of directors, and other affected parties. Critical liquidity events may also require the daily computation of regular liquidity risk reports and supplemental information, and comprehensive CFPs provide for more frequent and more detailed reporting as the stress situation intensifies.

The reputation of an institution is a critical asset when a liquidity crisis occurs, and proactive institutions maintain plans (including public relations plans) to help preserve their reputations in periods of perceived stress. Failure to appropriately manage reputation risk could cause severe damage to an institution.

And finally, comprehensive CFPs also address effective communication with key stakeholders, such as counterparties, credit-rating agencies, and customers. Smaller institutions that rarely interact with the media may benefit from having plans in place for how they will manage press inquiries and training front-line employees on how to respond to customer questions.

←

INTERNAL CONTROLS

Adequate internal controls are integral to ensuring the integrity of an institution's liquidity risk management process. An effective system of internal controls promotes effective operations, reliable financial and regulatory reporting, and compliance with relevant laws and institutional policies. Effective internal control systems are designed to ensure that approval processes and board limits are followed and any exceptions to policies are quickly reported to, and promptly addressed by, senior management and the board.

Independent Reviews

A key internal control involves having an independent party regularly evaluate the various components of the liquidity risk management process. A review typically assesses the effectiveness of liquidity risk management programs, taking into account the complexity of the institution's liquidity risk profile. Institutions may achieve independence by assigning this responsibility to the audit function or other qualified individuals independent of the risk management process. To facilitate the independence of the review process, reviewers typically report key issues requiring attention (including instances of noncompliance with laws and regulations or the institution's policies) to the ALCO and audit committee for prompt action.

←

EVALUATION OF LIQUIDITY

Liquidity Component Review

Under the *Uniform Financial Institutions Rating System*, a financial institution's liquidity position should be evaluated based on the current level and prospective sources of liquidity compared to funding needs, as well as the adequacy of funds management practices relative to the institution's size, complexity, and risk profile.

In general, funds management practices should ensure that an institution is able to maintain a level of liquidity sufficient to meet its financial obligations in a timely manner and to fulfill the legitimate banking needs of its community. Practices should reflect the ability of the institution to manage unplanned changes in funding sources, as well as react to changes in market conditions that affect the ability to quickly liquidate assets with minimal loss.

In addition, funds management practices should ensure that liquidity is not maintained at a high cost, or through undue reliance on funding sources that may not be available in times of financial stress or adverse changes in market conditions.

Liquidity is rated based upon, but not limited to, an assessment of the following evaluation factors:

- The adequacy of liquidity sources compared to present and future needs and the ability of the institution to meet liquidity needs without adversely affecting its operations or condition.
- The availability of assets readily convertible to cash without undue loss.
- Access to money markets and other sources of funding.
- The level of diversification of funding sources, both on- and off-balance sheet.
- The degree of reliance on short-term volatile funding sources (including borrowings and brokered deposits), to fund longer-term assets.
- The trend and stability of deposits.
- The ability to securitize and sell certain pools of assets.
- The capability of management to properly identify, measure, monitor, and control the institution's liquidity position, including the effectiveness of funds management strategies, liquidity policies, management information systems, and contingency funding plans.

Rating the Liquidity Factor

A rating of 1 indicates strong liquidity levels and well-developed funds management practices. The institution has reliable access to sufficient sources of funds on favorable terms to meet present and anticipated liquidity needs.

A rating of 2 indicates satisfactory liquidity levels and funds management practices. The institution has access to sufficient sources of funds on acceptable terms to meet present and anticipated liquidity needs. Modest weaknesses may be evident in funds management practices.

A rating of 3 indicates liquidity levels or funds management practices in need of improvement. Institutions rated 3 may lack ready access to funds on reasonable terms or may evidence significant weaknesses in funds management practices.

A rating of 4 indicates deficient liquidity levels or inadequate funds management practices. Institutions rated 4 may not have or be able to obtain a sufficient volume of funds on reasonable terms to meet liquidity needs.

A rating of 5 indicates liquidity levels or funds management practices so critically deficient that the continued viability of the institution is threatened. Institutions rated 5 require immediate external financial assistance to meet maturing obligations or other liquidity needs.

UBPR Ratio Analysis

The UBPR is an important analytical tool that shows the impact of management's decisions and economic conditions on a bank's earnings performance and balance sheet composition. Examiners should review UBPR ratios when analyzing the institution's liquidity position. UBPR ratios should be viewed in concert with the institution's internal liquidity ratios on a level and trend basis when assessing the liquidity position. Examiners should use caution when reviewing peer group ratios as the comparisons may not be meaningful due to the varying liquidity and funding needs of different institutions.

Some of the more common ratios that examiners should review include:

- Net Non-Core Funding Dependence,
- Net Loans and Leases to Deposits,
- Net Loans and Leases to Total Assets,
- Short-Term Assets to Short-Term Liabilities,
- Pledged Securities to Total Securities,
- Brokered Deposits to Deposits, and
- Core Deposits to Total Assets.

Examiners should recognize that UBPR liquidity ratio analysis might not provide an accurate picture of the institution's liquidity position. Examiners should consider the quality, stability, and unique characteristics of asset and liability accounts before analyzing liquidity ratios. In particular, loans, securities, deposits, and borrowings should be evaluated before using UBPR ratios to draw conclusions concerning the liquidity position.

INTRODUCTION

Sensitivity to market risk reflects the degree to which changes in interest rates, foreign exchange rates, commodity prices, or equity prices can adversely affect a financial institution's earnings or capital. For most community banks, market risk primarily reflects exposure to changing interest rates. Therefore, this section focuses on assessing interest rate risk (IRR). However, examiners may apply these same guidelines when evaluating foreign exchange, commodity, or equity price risks. A brief discussion of other types of market risks is included at the end of this section.

Market risks may include more than one type of risk and can quickly impact a financial institution's earnings and the economic value of its assets, liabilities, and off-balance sheet items. In order to effectively manage IRR, each institution should have an IRR management program that is commensurate with its size and the nature, scope, and risk of its activities.

The adequacy of a bank's IRR program is dependent on its ability to identify, measure, monitor, and control all material interest rate exposures. To do this accurately and effectively, institutions need:

- Appropriate IRR policies, procedures, and controls;
- Sufficiently detailed reporting processes to inform senior management and the board of IRR exposures;
- Comprehensive systems and standards for measuring and monitoring IRR; and
- Appropriate internal controls and independent review procedures.

←

TYPES AND SOURCES OF INTEREST RATE RISK

IRR can arise from a variety of sources and financial transactions and has many components including repricing risk, basis risk, yield curve risk, option risk, and price risk.

Types of Interest Rate Risk

Repricing risk reflects the possibility that assets and liabilities will reprice at different times or amounts and negatively affect an institution's earnings, capital, or general financial condition. For example, management may use non-maturity deposits to fund long-term, fixed-rate securities. If deposit rates increase, the higher funding costs would likely reduce net yields on fixed-rate securities.

Basis risk is the risk that different market indices will not move in perfect or predictable correlation. For example, LIBOR-based deposit rates may change by 50 basis points while prime-based loan rates may only change by 25 basis points during the same period.

Yield curve risk reflects exposure to unanticipated changes in the shape or slope of the yield curve. It occurs when assets and funding sources are linked to similar indices with different maturities. For example, a 30-year Treasury bond's yield may change by 200 basis points, but a 3-year Treasury note's yield may change by only 50-basis points during the same time period. This risk is commonly expressed in terms of movements of the yield curve for a type of security (e.g., a flattening, steepening, or inversion of the yield curve).

Option risk is the risk that a financial instrument's cash flows (timing or amount) can change at the exercise of the option holder, who may be motivated to do so by changes in market interest rates. Lenders are typically option sellers, and borrowers are typically option buyers (as they are often provided a right to prepay). The exercise of options can adversely affect an institution's earnings by reducing asset yields or increasing funding costs.

For example, assume that a bank purchased a 30-year callable bond at a market yield of 10 percent. If market rates subsequently decline to 8 percent, the bond's issuer will be motivated to call the bond and issue new debt at the lower market rate. At the call date, the issuer effectively repurchases the bond from the bank. As a result, the bank will not receive the originally expected yield (10 percent for 30 years). Instead, the bank must re-invest the principal at the new, lower market rate.

Price risk is the risk that the fair value of financial instruments will change when interest rates change. For example, trading portfolios, held-for-sale loan portfolios, and mortgage servicing assets contain price risk. When interest rates decrease, the value of an institution's mortgage servicing rights generally decrease because the total cash flows from servicing fees decline as consumers refinance. Because servicing assets are subsequently measured at fair value, or carried at amortized cost and tested for impairment, the fair value adjustment or any impairment is reflected in current earnings.

Sources of Interest Rate Risk

Funding sources may involve repricing risk, basis risk, yield curve risk, or option risk, and examiners should carefully evaluate all significant relationships between funding sources and asset structures. Potentially volatile or market-based funding sources may increase IRR, especially when matched to a longer-term asset portfolio.

For example, long-term fixed-rate loans funded by purchased federal funds may involve repricing risk, basis risk, or yield curve risk. As a result, interest rate movements could cause funding costs to increase substantially while asset yields remain fixed.

Derivative instruments may be used for hedging but can introduce complex IRR exposures. Depending on the specific instrument, derivatives may create repricing, basis, yield curve, option, or price risk.

Mortgage banking operations may create price risk within the loan pipeline, held-for-sale portfolio, and mortgage servicing rights portfolio. Interest rate changes affect not only current values, but also future business volumes and related fee income.

Fee income businesses may be influenced by IRR, particularly mortgage banking, trust, credit card servicing, and non-deposit product sales. Changing interest rates could affect such activities.

Product pricing strategies may introduce IRR, particularly basis risk or yield curve risk. Basis risk exists if funding sources and assets are linked to different market indices. Yield curve risk exists if funding sources and assets are linked to similar indices with different maturities.

Embedded options associated with assets, liabilities, and off-balance sheet derivatives can create IRR. Embedded options are features that provide the holder with the right, but not the obligation, to buy, sell, pay down, payoff, withdraw, or otherwise alter the cash flow of the instrument. The holder of the option can be the bank, the issuer, or a counterparty. Many instruments contain embedded options that can alter cash flows and impact the IRR profile of the institution, including:

- Non-maturity deposits: Depositors have the option to withdraw funds at any time.
- Callable bonds: The issuer has the option to redeem all or part of a bond before maturity (based on contractual call dates).
- Structured notes: Options can vary by the type of instrument and may include step-up features, interest rate caps and floors, and cash flow waterfall triggers.
- Wholesale borrowings: Lenders may have a call option (requiring banks to repay borrowings), or borrowing banks may have a put option (allowing them to prepay borrowings).
- Derivatives: Derivative owners may hold an option to purchase additional securities or to exercise an existing derivative contract.
- Mortgage loans: Borrowers may have the option to partially or fully prepay the loan.
- Mortgage-backed securities (MBS): Borrowers' options to prepay individual mortgage loans included in an MBS loan pool can shorten the life of a tranche of loans within a security.

Embedded options can create various risks, such as contraction risk, extension risk, and negative convexity. Contraction risk increases when rates decline and borrowers can refinance at a lower rate, forcing the bank to reinvest those funds at a lower rate. Extension risk increases when rates rise and borrowers become less likely to prepay loans, thereby locking banks into below-market returns. Convexity measures the curvature in the relationship between certain investment prices and yields and reflects how the duration of an instrument changes as rates change.

←

RISK MANAGEMENT FRAMEWORK

The IRR management framework sets forth strategies and risk tolerances as established in the institution's policies and procedures that guide the identification, measurement, management, and control of sensitivity to market risk. The framework begins with sound corporate governance and covers strategies, policies, risk controls, measurements, reporting responsibilities, independent review functions, and risk mitigation processes.

The formality and sophistication of the IRR management program should correspond with an institution's balance sheet complexity and risk profile. Less complex programs may be adequate for institutions that maintain basic balance sheet structures, have moderate exposure to embedded options, and do not employ complicated funding or investment strategies. However, all institutions should clearly document their procedures, and senior management should actively supervise daily operations.

More complex institutions need more formal, detailed IRR management programs. In such cases, management should establish specific controls and produce sound analyses that address all major risk exposures. Internal controls at complex institutions should include a more thorough independent review and validation process for the IRR models employed, as well as more rigorous requirements for separation of duties.

At all institutions, management and the board should understand the IRR implications of their business activities, products, and strategies, while also considering their potential impact on market, liquidity, credit, and operational risks.

Board Oversight

Effective board oversight is the cornerstone of sound risk management. The board of directors is responsible for overseeing the establishment, approval, implementation, and annual review of IRR management strategies, policies, procedures, and risk limits. The board should understand and regularly review reports that detail the level and trend of the institution's IRR exposure.

The board or an appropriate board committee should review sensitivity to market risk information at least quarterly. The information should be timely and of sufficient detail to allow the board to assess senior management's performance in monitoring and controlling market risks and to assess management's compliance with board-approved policies.

In order to fulfill its responsibilities in this area, the board is expected to:

- Establish formal risk management policies, strategies, and risk tolerance levels;
- Define management authorities and responsibilities;
- Communicate its risk management strategies and risk tolerance levels to all responsible parties;
- Monitor management's compliance with board-approved policies;
- Understand the bank's risk exposures and how those risks affect enterprise-wide operations and strategic plans; and
- Provide management with sufficient resources to measure, monitor, and control IRR.

Senior Management Oversight

Senior management is responsible for ensuring that board-approved IRR strategies, policies, and procedures are appropriately executed. Management should ensure that risk management processes consider the impact that various risks, including credit, liquidity, and operational risks could have on IRR.

Management is responsible for maintaining:

- Appropriate policies, procedures, and internal controls that address IRR management, including limits and controls that ensure risks stay within board-approved tolerances;
- Comprehensive systems and standards for measuring IRR, valuing positions, and assessing performance;
- Adequate procedures for updating IRR measurement scenarios and documenting key assumptions that drive IRR analysis; and
- Sufficient reporting processes for informing senior management and the board of the level of IRR exposure.

IRR reports should provide sufficient aggregate information and supporting details to enable senior management and the board to assess the impact of market rate changes and the impact of key assumptions in the IRR model.

The Asset/Liability Committee (ALCO) or a similar senior management committee should actively monitor the IRR profile. The committee should have sufficient representation across major functions (e.g., lending, investment, and funding activities) that they can directly or indirectly influence the institution's IRR exposure.

Policies and Procedures

Policies and procedures should be comprehensive and govern all material aspects of an institution's IRR management process. IRR policies and procedures should:

- Address board and senior management oversight;
- Outline strategies, risk limits, and controls;
- Define general methods used to identify risk;
- Describe the type and frequency of monitoring and reporting;
- Provide for independent reviews and internal controls;
- Ensure that significant new strategies, products, and businesses are integrated into the IRR management process;
- Incorporate the assessment of IRR into institution-wide risk management procedures so that interrelated risks are identified and addressed; and
- Provide controls over permissible risk mitigation activities, such as hedging strategies and instruments, if applicable.

Interest Rate Risk Strategies

Management should develop IRR strategies that reflect board-approved risk tolerances and do not expose the bank to excessive risk. An institution's risk profile is a function of the bank's activities and products. For example, an institution's IRR strategy may be to maintain a short-term, non-complex balance sheet. In order to implement that strategy, management may hold loans and securities with short durations and minimal embedded options and fund the assets with nonmaturity deposits and short-term borrowings.

Some institutions may conduct borrowing and investment transactions (leverage strategies) that are separate from the bank's core operations. In a typical leverage strategy, management acquires short- or intermediate-term wholesale funds or borrowings and invests those funds in longer-term bonds. Prior to implementing a leverage strategy, management should have the skills to understand, measure, and manage the risks. Management should be able to demonstrate a transaction's effect on the bank's risk profile and document that the exposure is within established risk limits.

Management should measure and document a strategy's effect on IRR exposure prior to implementation, periodically thereafter, and prior to any significant strategy changes. Institutions should consider stress testing all prospective strategies and ensure IRR exposures are within established risk limits.

Risk Limits and Controls

Risk limits should reflect the board's tolerance of IRR exposure by restricting the volatility of earnings and capital for given rate movements and applicable time horizons. Risk limits should be explicit dollar or percentage parameters. IRR exposure limits should be commensurate with the complexity of bank activities, balance sheet structure, and off-balance sheet items. At a minimum, limits should be expressed over one and two year time horizons, correspond to the internal measurement system's methodology, and appropriately address all key IRR risks and their effect on earnings and capital.

Examiners should carefully evaluate policy guidelines and board-approved risk limits. Institutions should establish limits that are neither so high that they are never breached, nor so low that exceeding the limits is considered routine and unworthy of action. Effective limits will provide management sufficient flexibility to respond to changing economic conditions, yet be stringent enough to prevent excessive risk-taking.

Policies should be in place to ensure excessive IRR exposures receive prompt attention. Controls should be designed to help management identify, evaluate, report, and address excessive IRR exposures. Policies should require management to regularly monitor risk levels, and controls should be altered as needed when economic conditions change or the board alters its risk tolerance level. Reports or stress tests that reflect significant IRR exposure should be promptly reported to the board (or appropriate board committee), and the board should review all risk limit exceptions and management's proposed actions.

Earnings-based risk limits may include volatility considerations involving:

- Net interest margin,
- Net interest income,
- Net operating income, and
- Net income.

Capital-based risk limits may include volatility considerations involving:

- Economic value of equity, and
- Other comprehensive income.

The board should provide staffing resources sufficient to ensure:

- Effective operation of measurement systems,
- Appropriate analytic expertise,
- Adequate training and staff development, and
- Regular independent reviews.

Risk Monitoring and Reporting

Management should report IRR in an accurate, timely, and informative manner. At least quarterly, senior management and the board should review IRR reports. Institutions that engage in complex or higher risk activities should assess IRR more frequently. At a minimum, IRR exposure reports should contain sufficient detail to permit management and the board to:

- Identify the source and level of IRR;
- Evaluate key assumptions, such as interest rate forecasts, deposit behaviors, and loan prepayments; and
- Determine compliance with policies and risk limits.

←

INTEREST RATE RISK ANALYSIS

An effective risk management system must clearly quantify and timely report risks. Institutions should have sound IRR measurement procedures and systems that assess exposures relative to established risk tolerances. Such systems should be commensurate with the complexity of the institution. Although management may rely on third-party IRR models, they should fully understand the underlying analytics, assumptions, and methodologies of the models and ensure such systems and processes are incorporated appropriately in the strategic (long-term) and tactical (short-term) management of IRR exposures.

Management should conduct careful due diligence/pre-acquisition reviews to ensure they understand the IRR characteristics of new products, strategies, and initiatives. Management should also consider whether existing measurement systems can adequately capture new IRR exposures. When analyzing whether or not a product or activity introduces new IRR exposures, management should consider that changes to an instrument's maturity, repricing, or repayment terms can materially affect a product's IRR characteristics. Institutions may be able to run alternative scenarios in their IRR models to test the effects of new products and initiatives. If an institution is unable to run alternative scenarios using existing models, they should use other methods to estimate the risk of new products, strategies, and initiatives. All institutions should ensure that the method(s) they use to evaluate new products and initiatives (running alternative scenarios in existing models or through other means), adequately captures potential market risks.

Management should consider earnings and the economic value of capital when evaluating IRR. Reduced earnings or losses can harm capital, liquidity, and the institution's reputation. Risk-to-earnings measurements are normally derived from simulation models that estimate potential earnings variability. Economic value of equity (EVE) measurements allow for longer-term earnings and capital analysis. The analysis may be useful for long-term planning and may also indicate a need for short-term actions to mitigate IRR exposure. Long term earnings-at-risk simulations (5 to 7 years) can be a helpful supplement to EVE measures, but they are not a replacement for EVE measurements.

←

INTEREST RATE RISK MEASUREMENT METHODS

Institutions are encouraged to use a variety of measurement methods to assess their IRR profile. Regardless of the methods used, a bank's IRR measurement system should be sufficient to capture all material balance sheet items and to quantify exposures to both earnings and capital. The most common types of IRR measurement systems are:

- Gap Analysis,
- Duration Analysis,
- Earnings Simulation Analysis,
- Earnings-at-Risk,
- Capital-at-Risk, and
- Economic Value of Equity.

Gap Analysis

Gap analysis is a simple IRR methodology that provides an easy way to identify repricing gaps. It can also be used to estimate how changes in rates will affect future income. However, gap analysis has several weaknesses and is generally not sufficient as a financial institution's sole IRR measurement method. Gap analysis can be a first step in identifying IRR exposures and may serve as a reasonableness check for more sophisticated forms of IRR measurement, particularly in less complex institutions with simple balance sheets.

Gap analysis helps identify maturity and repricing mismatches between assets, liabilities, and off-balance sheet instruments. Gap schedules segregate rate-sensitive assets (RSA), rate-sensitive liabilities (RSL), and off-balance sheet instruments according to their repricing characteristics. Then, the analysis summarizes the repricing mismatches for defined time horizons. Additional calculations can then estimate the effect the repricing mismatches may have on net interest income.

A basic gap ratio is calculated as:

$$\frac{\text{RSA}^{\textit{minus}}\ \text{RSL}}{\text{Average Earning Assets}}$$

Gap analysis may identify periodic, cumulative, or average mismatches, or it may show the ratio of RSA-RSL divided by average assets or total assets. However, using those denominators does not produce a standard gap ratio. They simply provide other ways of describing the degree of repricing mismatches.

A bank has a positive gap if the amount of RSAs repricing in a given period exceeds the amount of RSLs repricing during the same period. When a bank has a positive gap, it is said to be asset sensitive. Should market interest rates decrease, a positive gap indicates that net interest income would likely also decrease. If rates increase, a positive gap indicates that net interest income may also increase.

Conversely, a bank has a negative gap when the amount of RSLs exceeds the amount of RSAs repricing during the same period. When a bank has a negative gap, it is said to be liability sensitive, and a decrease in market rates would likely cause an increase in net interest income. Should interest rates increase, a negative gap indicates net interest income may decrease. While the terms asset and liability sensitive are generally used to describe gap results, they can also be used to describe the results of other models, or even the general IRR exposure of a bank.

The gap ratio can be used to calculate the potential impact on interest income for a given rate change. This is done by multiplying the gap ratio by the assumed rate change. The result estimates the change to the net interest margin.

For example, assume a bank has a 15 percent one-year average gap. If rates decline 2 percent, then the projected impact is a 30 basis point decline in the net interest margin (15 percent x 2 percent). This estimate assumes a static balance sheet and an immediate, sustained interest rate shift.

Gap analysis has several advantages. Specifically, it:

- Identifies repricing mismatches,
- Does not require sophisticated technology,
- Is relatively simple to develop and use, and
- Can provide clear, easily interpreted results.

However, the weaknesses of gap analysis often overshadow its strengths, particularly for a majority of financial institutions. For example, gap analysis:

- Generally captures only repricing risk,
- Assumes parallel rate movements in assets and liabilities,
- Generally does not adequately capture embedded options or complex instruments,
- May not identify material intra-period repricing risks, and
- Does not measure changes in the economic value of capital.

Some gap systems attempt to capture basis, yield curve, and option risk. Multiple schedules (dynamic or scenario gap analysis) can show effects from non-parallel yield curve shifts. Additionally, sensitivity factors may be applied to account categories. These factors assume that coupon rates will change by a certain percentage for a given change in a market index. The market index is designated as the driver rate (sophisticated systems may use multiple driver rates). These sensitivity percentages, also called beta factors, may dramatically change the results.

Institutions can also use sensitivity factors in their gap analysis to refine non-maturity deposit assumptions. For example, management may determine that the cost of funds for money market deposit accounts (MMDA) will increase by 75 basis points whenever the six-month Treasury bill rate increases by one percent. Thus, management might consider only 75 percent of MMDA balances as rate sensitive for gap analysis. Management may expand its analysis by preparing gap schedules that assume different market rate movements and changing customer behaviors.

As noted above, gap analysis is generally not suitable as the sole measurement of IRR for the large majority of institutions. Only institutions with very simple balance sheet structures, limited assets and liabilities with embedded options, and limited derivative instruments and off-balance sheet items should consider relying solely on gap analysis for IRR measurements.

Duration Analysis

Duration analysis measures the change in the economic value of a financial instrument or position that may occur given a small change in interest rates. It considers the timing and size of cash flows that occur before the instrument's contractual maturity. Additional information on different types of duration analysis is included below and in the glossary.

Macaulay duration calculates the weighted average term to maturity of a security's cash flows. Duration, stated in months or years, always:

- Equals maturity for zero-coupon instruments,
- Equals less than maturity for instruments with payments prior to maturity,
- Declines as time elapses,
- Is lower for amortizing instruments, and
- Is lower for instruments with higher coupons.

Modified duration, calculated from Macaulay duration, estimates price sensitivity for small interest rate changes. An instrument's modified duration represents its percentage price change given a small change in interest rates.

Modified duration assumes that interest rate shifts will not change an instrument's cash flows. As a result, it does not estimate price sensitivity with an acceptable level of precision for instruments with embedded options (e.g., callable bonds or mortgages). Institutions with significant option risk should not rely solely upon modified duration to measure IRR.

Effective duration estimates price sensitivity more accurately than modified duration for instruments with embedded options and is calculated using valuation models that contain option pricing components. First, the user must determine the instrument's current value. Next, the valuation model assumes an interest rate change (usually 100 basis points) and estimates the instrument's new value based on that assumption. The percentage change between the current and forecasted values represents the instrument's effective duration.

All duration measures assume a linear price/yield relationship. However, that relationship actually is curvilinear, which means that large shifts in rates have a greater effect than smaller changes. Therefore, duration may only accurately estimate price sensitivity for rather small (up to 100 basis point) interest rate changes. Convexity-adjusted duration should be used to more accurately estimate price sensitivity for larger interest rate changes (over 100 basis points).

Duration analysis contains significant weaknesses. Accurate duration calculations require significant analysis and complex management information systems. Further, duration only measures value changes accurately for relatively small interest rate fluctuations. Therefore, institutions must frequently update duration measures when interest rates are volatile or when any significant change occurs in economic conditions, market conditions, or underlying assumptions.

Earnings Simulation Analysis

Earnings simulation models (such as pro-forma income statements and balance sheets) estimate the effect of interest rate changes on net interest income, net income, and capital for a range of scenarios and exposures. Historically, comprehensive simulation models (both long- and short-term) were primarily used by larger, more complex institutions. Current technology allows less complex institutions to perform cost effective, comprehensive simulations of the potential impact of changes in market rates on earnings and capital.

A simulation model's accuracy depends on the use of accurate assumptions and data. Like any model, inaccurate data or unreasonable assumptions lead to inaccurate or unreasonable results.

A key aspect of IRR simulation modeling involves selecting an appropriate time horizon(s) for assessing IRR exposures. Simulations can be performed over any period and are often used to analyze multiple horizons identifying short-, intermediate-, and long-term risks. When using earnings simulation models, IRR exposures are often more accurate when projected over at least a two-year period. Using a two-year time frame better captures the full impact of important transactions, tactics, and strategies, which may be hidden by only viewing projections over shorter time horizons. Management should be encouraged to measure earnings at risk for each one-year period over their simulation horizon to better understand how risks evolve over time. For example, if the bank runs a two year simulation, one- and two-year simulation reports should be generated.

Longer-term earnings simulations of up to five to seven years may be recommended for institutions with material holdings of products with embedded options. Such extended simulations can be helpful for IRR analysis and economic value measurements. It is usually easier for an extended simulation model to identify when long-term mismatches occur (e.g., it can show that a bank is liability sensitive in years two, three, and four, but asset sensitive in years five, six, and seven), whereas EVE models aggregate the effect of such mismatches.

Institutions may vary their simulation rate scenarios based on factors such as pricing strategies, balance sheet compositions, hedging activities, etc. Simulation may also measure risks presented by non-parallel yield curve shifts.

Institutions can run static or dynamic simulations. Static models are based on current exposures and assume a constant balance sheet with no new growth. The models can also include replacement-growth assumptions where replacement growth is used to offset reductions in the balance sheet during the simulation period.

Dynamic simulation models may assume asset growth, changes in existing business lines, new business, or changes in management or customer behaviors. Dynamic simulation models can be useful for business planning and budgeting purposes. However, these simulations are highly dependent on key variables and assumptions that are difficult to project with accuracy over an extended period. Also, when management changes simulation scenarios, it may lose insights on the bank's current IRR positions. Dynamic simulations can provide beneficial information but, due to their complexity and multitude of assumptions, can be difficult to use effectively and may mask significant risks.

Projected growth assumptions in dynamic modeling often alter the balance sheet in a manner that reflects reduced IRR exposure. For example, if a liability-sensitive bank assumes significant growth in one-year adjustable rate mortgages or long-term liabilities and the growth targets are not met, management may have underestimated exposures to changing interest rates. Therefore, when performing dynamic simulations, institutions should also run static or no-growth simulations to ensure they produce an accurate, comparative description of the bank's IRR exposure.

Economic Value of Equity

Despite their benefits, both static and dynamic earnings simulations have limitations in quantifying IRR exposure. As a result, economic value methodologies should also be used to broaden the assessment of IRR exposures, particularly to capital.

Economic value methodologies attempt to estimate the changes in a bank's economic value of capital caused by changes in interest rates. A bank's economic value of equity represents the present value of the expected cash flows on assets minus the present value of the expected cash flows on liabilities, plus or minus the present value of the expected cash flows on off-balance sheet instruments.

Typically, an EVE model projects the value of a bank's economic capital for a base-case scenario, and then compares it to a stress scenario. These models go by various names and acronyms, such as EVE, MVE (Market Value of Equity), or NPV (Net Present Value).

In theory, an economic valuation approach has a broader scope than an earnings approach, since it captures all anticipated cash flows and is generally more effective in capturing embedded options. An economic valuation approach measures all estimated changes to the balance sheet and earnings, as opposed to gap models and earnings simulations, which generally measure shorter-term balance sheet and earnings projections. Economic valuation methods can be an effective supplement to short-term measures.

Many institutions can benefit from the use of economic value methods and should establish EVE risk limits and integrate economic valuation methods into their IRR measurement procedures. Because different EVE models calculate different base-case economic capital values for the same bank, limits should generally be based on the change of economic capital rather than absolute levels of economic capital. Accordingly, examiners should assess the relative changes in economic value of capital as a key indication of risk.

Most economic value models use a static approach where the analysis does not incorporate new business lines and all financial instruments are held until final payout or maturity. The analysis shows a snapshot of the risk inherent in a portfolio or balance sheet. However, this is not always the case as some models incorporate dynamic techniques that provide forward-looking estimates of economic value.

Because EVE estimates the future cash flows of the bank's financial instruments, the cash flows can be difficult to accurately quantify. This can be especially true for non-maturity deposits since the products generally have uncertain cash flows and durations. Consequently, estimating the value of these accounts can be difficult and requires the use of several assumptions. Management should be cautious when making EVE assumptions, as output errors can be more pronounced in long-term measurements. Examiners should consider the significance, accuracy, and sensitivity of underlying assumptions when assessing EVE models.

When modeling complex products with embedded options, the importance of data aggregation and stratification should not be overlooked. Complex or structured securities should be modeled on an individual basis, and homogenous balance sheet accounts should be aggregated by common IRR features. For example, loan portfolios, when possible, should be aggregated by product type, coupon, maturity, and prepayment volatility. For adjustable rate portfolios, modeling should include more IRR attributes, such as coupon reset dates and indexes; embedded caps and floors; and prepayment penalties.

Despite being different methodologies, earnings simulation and EVE models generally provide a consistent view of IRR trends. However, the two approaches may also generate divergent outcomes. In many cases, earnings simulation models provide shorter-term results and EVE models provide a much longer-term risk profile. These divergent outcomes can result from a variety of factors, such as the structure of the balance sheet, including the bank's derivative positions and off-balance sheet items, the interest rate environment, the timing of asset/liability mismatches, the sensitivity of funding sources to interest rate changes, and the volume of fixed- or floating-rate assets. Because many versions of each model type are available, management should ensure that the models used capture all significant risk factors.

←

STRESS TESTING

Stress testing, which includes both scenario and sensitivity analysis, is an integral part of IRR management. Scenario analysis estimates possible outcomes given an event or series of events, while sensitivity analysis estimates the impact of change in one or only a few of a model's significant parameters.

Management should assess a range of alternative interest rate scenarios when conducting scenario analyses. The range should be sufficient to fully identify repricing, basis, and yield curve risks as well as the risk of embedded options. In many cases, static interest rate shocks consisting of parallel shifts in the yield curve of only plus and minus 200 basis points are not sufficient to adequately assess IRR exposure. Therefore, management should regularly assess a wide range of exposures across different periods, including changes in rates of greater magnitude (e.g., up and down 300 and 400 basis points). When conducting stress tests, management should give special consideration to financial instruments or markets where concentrations exist, as such positions may be difficult to unwind or hedge during periods of market stress. Management should compare stress test results against approved limits.

Management should ensure their scenarios are rigorous and consistent with the existing level of rates and the interest rate cycle. For example, in low-rate environments, scenarios involving significant declines in market rates can be deemphasized in favor of increasing the number and size of alternative rising-rate scenarios. Alternatively, there may be instances where more extreme stress tests would be desirable.

Depending on a bank's IRR profile, stress scenarios should include:

- Instantaneous and significant rate changes,
- Substantial rate changes over time,
- Changes in the relationships between key market rates, and
- Changes in the shape or slope of the yield curve.

Not all financial institutions need to use the full range of the scenarios discussed above. Non-complex institutions (for instance, institutions with limited embedded options or structured products) may be able to justify running fewer or less intricate scenarios.

Management should run repricing risk scenarios regularly. When applicable, institutions should also run scenarios for other IRR risks, such as basis and yield curve risks. Institutions should assess these risk exposures at least annually or when the risk profile of a bank changes, for example, because of acquisitions, significant new products, or new hedging programs. If a bank shows material exposure to one of these risks, an appropriate scenario should be included in monthly or quarterly IRR monitoring. If an institution has relatively non-complex exposure to basis, yield curve, or options risk, management should document that the exposure is minimal. For example, management may document its assessment with a short narrative description of what percentage of assets and liabilities are tied to various indices and a description of the potential impact of the risks. These reports should typically be reviewed by the board at least annually.

Sensitivity analysis should be included in stress testing to help determine which assumptions have the most influence on a model's output. By identifying key assumptions, management, when necessary, can refine the assumptions to increase the accuracy of their models. The most significant variables can be tested by keeping all other variables constant, changing the variable in question, and comparing the results to the base-case scenario. Additionally, sensitivity analysis can be used to determine the conditions under which key business assumptions or model parameters break down or when IRR may be exacerbated by other risks or earnings pressures. When management includes assumptions based on strategic initiatives, it is imperative that they assess the impact of not meeting projections. (Refer to Sensitivity Testing - Key Assumptions for more details.)

←

INTEREST RATE RISK MEASUREMENT SYSTEMS

The IRR measurement system should be appropriate for institution's risk profile. The measurement system should capture all material sources of IRR and generate meaningful reports for senior management and the board of directors. Management should ensure risks are measured over a relevant range of interest rate changes, including meaningful stress situations. Further, the measurement system must be subject to appropriate internal controls and periodic independent reviews. The IRR measurement process should be well documented and administered by individuals with sufficient technical knowledge.

IRR measurement systems can range from simple methods to sophisticated programs that include stochastic data modeling. (Stochastic modeling involves using one or more random variables in a model.) However, all measurement systems should use generally accepted financial concepts and risk measurement techniques and have an adequate level of transparency. If a third-party model is used, management should review the adequacy and comprehensiveness of the vendor's model-validations and internal control reviews. Also, management should consider the capabilities of the software to meet the institution's future needs and the adequacy of ongoing vendor support and training.

A bank's IRR measurement system is a critical part of its overall risk management process. Examiners rely heavily on the output of the measurement systems when assessing sensitivity to market risk. Accordingly, the review of such systems and their operation is a crucial element of the examination process. The review process should address the following items:

- Capabilities of the measurement system,
- Accuracy of system inputs,
- Reasonableness and documentation of material assumptions,
- Usefulness of system output/reports, and
- Adequacy of periodic variance analysis.

Measurement System Capabilities

The IRR measurement system should capture and reliably estimate all material risk exposures. Therefore, the system should consider all significant balance sheet categories, income statement items, and risk factors. For example, if an institution has material holdings of mortgage loans or mortgage-backed securities, then its measurement system should be able to adequately incorporate prepayment projections. Likewise, if the bank has a mortgage banking operation that generates material fee income, its system should capture the rate sensitivity of this noninterest income.

When an institution develops an IRR model internally or considers acquiring a third-party model, management should assess its suitability by evaluating the model's ability to reasonably capture all relevant and material IRR exposures. Additionally, management should periodically re-evaluate the adequacy of a model in use as risk positions, strategies, and activities change.

To effectively use its IRR measurement system, management must fully understand the system's capabilities, limitations, quantitative methodologies, and use of assumptions.

System Documentation

Both purchased and internally developed systems should be supported by adequate documentation. System documentation should provide complete information regarding the factors discussed above. Management should be familiar with and retain all pertinent system documentation. Management should also review and maintain documentation of changes or upgrades to the model.

Adequacy of Measurement System Inputs

A model's accuracy depends on the assumptions and data used. Like any model, inaccurate data or unreasonable assumptions will render inaccurate results.

System data should accurately reflect the bank's current condition. When evaluating the adequacy of a model, management should consider the extent to which the model uses automated versus manual processes; whether the model has automated interfaces with the bank's core systems; and the funds, hardware, staff, and expertise needed to run and maintain the model.

Examination of the system's input process should focus on the procedures for inputting and reconciling system data, categorizing and aggregating account data, ensuring the completeness of account data, and assessing the effectiveness of internal controls and independent reviews.

The internal control process must be comprehensive enough to ensure that data inputs are accurate and complete prior to running the system and generating reports. The bank may input data manually, through data-extract programs, or a combination of both techniques. Internal control procedures should be established to ensure that input data, such as general ledger balances and contractual terms, are accurately captured. Institutions should verify system inputs by having experienced personnel reconcile the balances to the general ledger. This is often done using automated software that can identify and report exception items.

In addition to capturing account balances, institutions with complex balance sheets should use measurement systems that adequately capture the embedded market risk of all material on- and off-balance sheet activity. Most measurement systems allow for the input of the following contractual terms:

- Current balance,
- Contractual maturities,
- Principal and interest payments and frequencies,
- Coupon rates and repricing frequencies,
- Contractual caps and floors, and
- Contractual optionality (such as security or borrowing calls).

Account Aggregation

Account aggregation is the process of grouping together accounts of similar types and cash flow characteristics. This is an important component of the data input process as account aggregation improves the measurement system's efficiencies. Typically, loans of similar rate, maturity, and type (e.g., 6 percent, 30 year, residential loans) are aggregated. Grouping 6 percent, 30 year residential loans together may be appropriate, but grouping together 6 percent fixed-rate loans with 6 percent adjustable-rate loans is not.

The degree of account aggregation will vary from one institution to another. Institutions should ensure the model allows for a sufficient separation of accounts with significantly different cash flow patterns. For example, models that aggregate information based on Call Report data may not provide the granularity necessary for institutions with significant levels of embedded options. When applicable, institutions should ensure their systems have the ability to model highly structured instruments and bank-specific products.

Both contractual and behavioral characteristics should be considered when determining the cash flow patterns of accounts to aggregate. The process of determining which accounts are combined should be transparent, documented, and periodically reviewed. Furthermore, requests for changes to existing groups or new account aggregations should be formalized and documented. Institutions should maintain documentation disclosing the characteristics of aggregated assets and liabilities (including all derivative instruments), and off-balance sheet items.

Assumptions

Assessing the reasonableness of assumptions is a critical part of reviewing an IRR measurement system. It is important that assumptions accurately reflect management's expectations regarding interest rates, customer behaviors, and local and macro-economic factors. Assumptions are typically derived using a combination of internal analysis and external sources. All material assumptions should be regularly updated and supported with thorough analysis and documentation.

IRR measurement systems rely on assumptions regarding key parameters, such as:

- Projected interest rates,
- Driver rate relationships,
- Non-maturity deposits, and
- Prepayments.

It is important that material assumptions be updated regularly to reflect the current market and operating environment. Furthermore, the process for developing material assumptions should be formalized and periodically assessed (at least annually for critical assumptions). This periodic assessment of the information and processes used to generate assumptions may prompt management to reevaluate its assumptions in order to better reflect current strategies or customer behaviors.

Sensitivity Testing - Key Assumptions

Proper IRR management requires an understanding of which assumptions have the greatest impact on results. Through sensitivity testing, management can identify the assumptions that have the most effect on model results. Documentation and monitoring should reflect the relative importance of assumptions. Sensitivity testing can also be used to identify less material assumptions, where assumption documentation, monitoring, and testing are less critical. Sensitivity testing can also be used to identify weaknesses in the model. For example, if an institution tested an assumption that was expected to have a critical impact on the model result, but instead found that it had little or no influence on the model output, further investigation would be warranted.

Sensitivity testing should only be applied to one assumption at a time and should test the effects of both large and small changes in an assumption on the model's overall output. For example, if an institution wanted to test the sensitivity of non-maturity deposit decay rates, it could alter its non-maturity deposit beta assumptions incrementally (up and down) in multiple scenarios (e.g., a 10, 25, and 50 percent increase/decrease from the base-case assumption). The revised results could then be compared to the base-case scenario. If a change in the assumption disproportionately impacts the model, then management should implement more robust assumption documentation, monitoring, and testing. Another sound practice when testing assumptions is to determine how extreme changes in key assumptions impact results and whether the results approach approved tolerance levels.

Conducting sensitivity testing on an annual basis is usually adequate for many institutions. However, more frequent tests should be performed if concerns are identified. Institutions should document the results of sensitivity testing and present the results to management and the board. The results of sensitivity testing should be considered when setting various assumptions. Management should conduct thorough due diligence before changing key assumptions that can materially alter model results. Key assumption changes should be properly documented and reviewed by the board.

Projected interest rate assumptions are a critical part of measuring IRR and may be generated by internal analysis or external sources. Internal interest rate forecasts, which may be derived from implied forward yield curves, economic analysis, or historical regressions, should be documented to support the assumptions used in the analysis. Key rate assumptions that should be considered include assumptions for general market rates, repricing rates, replacement interest rates, and discount rates.

Most institutions perform scenario analysis using deterministic interest rate yield curves. With the deterministic method, all interest rate scenarios are set by the user; that is, management selects the interest rate changes to simulate in the model. The deterministic method differs from the more complex and sophisticated stochastic method where multiple scenarios are generated using random path-dependent variables. (Further discussion of deterministic and stochastic methods may be found in the glossary.)

Analysis should be performed using a base-case interest rate scenario, as well as low-probability/high-risk scenarios, so that management can better estimate the impact to earnings and capital levels in stressed interest rate scenarios. The base-case interest rate scenario should be consistent with other forecasts used in the bank's overall planning process and should remain reasonably consistent across reporting periods. Any changes in the source of interest rate forecasts between reporting periods should be justified and documented.

Driver rates are used extensively in most income simulation and EVE models. The models capture the relationship between primary market interest rates (driver rates) and the rates of bank products. While there may be no direct connection between bank rates and the driver rate, the driver rate is chosen as a proxy for management's reaction to market changes. This frees management from needing to set rates explicitly for each loan or deposit type for each projected scenario. In most cases, bank rates are set to move in relation to the driver rate. The move may be referred to as a spread (when a specified number of basis points are added to or subtracted from a driver rate), or as a beta factor (when based on a percentage change in a driver rate). For example, management might specify that the rate paid on MMDAs will increase 75 basis points if the yield on one-year Treasury bills increases 100 basis points. By designating this relationship, pricing on all products linked to the driver rate will change to reflect the relationship built into the model. More complex systems may use a variety of driver rates tailored for different products. While most systems maintain static rate relationships, more sophisticated systems can alter relationships for different interest rate environments.

Spread or beta assumptions should be based on an analysis of the relationship between the product (e.g., MMDA) and the driver rate (e.g., federal funds rate). To determine the spread or beta, management can perform correlation or regression analysis to quantify the historical relationship between the product and driver rates.

Correlation analysis may also be used to determine the level of basis risk when instruments are tied to different indices. For instance, if an institution enters into a leveraging strategy that uses borrowed funds tied to LIBOR to invest in U.S. Treasury securities, correlation analysis can be performed to determine how closely the related rates move together. Less correlated instruments present greater basis risk.

Non-maturity deposit (NMD) rate sensitivity is typically one of the most critical and most difficult assumptions that management makes when measuring IRR exposure. The potential actions of management and customers need to be considered. Just as customers have control over the level and location of their deposit accounts, management has broad control over the rates paid on these accounts. In setting rates, management must take into account a wide array of factors, including local and national competition, the bank's funding needs, and the relative costs of alternative funding sources.

The assumptions modeled for NMDs should reflect both aspects of this relationship: management's control over rates and customers' control over their funds. Consideration should be given not only to historical correlation analysis, but also to management's intentions regarding future rate movements. If the measurement system has the capacity to reflect different assumptions for rising and falling rates, management should establish rate sensitivity assumptions for both scenarios.

Non-maturity deposits present a unique problem in EVE modeling because they lack contractual maturity dates. Generally an asset or liability must have a maturity date in order to be valued under present value methods. Therefore, in order to successfully model these accounts, an EVE model must use management's assumptions regarding the maturity of the accounts. The most common of these assumptions is the decay rate assumption. The decay rate reflects the amount of nonmaturity (and other) deposits that may be withdrawn or accounts closed in a given rate environment.

Management should use NMD assumptions that reflect institution-specific factors and avoid overreliance on industry estimates or default assumptions contained in off-the-shelf IRR models. Some institutions have difficultly measuring decay rates on NMDs due to limited historical data, acquisitions, mergers, or a lack of technical expertise. Industry averages provide approximations, but are often not the most accurate estimates because they are not tailored to the bank's products, pricing strategies, market, and experience. However, management can use industry estimates as a starting point until they develop adequate data sets. Industry estimates can also serve as a benchmarking tool to test the reasonableness of internal assumptions. Management should consider modeling different decay rates under various rate scenarios and, when appropriate, should consider engaging third parties to assist in determining NMD assumptions. Examiners should recognize that NMD decay rate are often imprecise, yet significant factors in IRR analysis.

Assumptions regarding NMDs are particularly critical in market environments in which customer behaviors may be atypical, or in which institutions are subject to heightened competition for such deposits. Generally, rate-sensitive and higher-cost deposits, such as brokered and Internet deposits, reflect higher decay rates than other types of deposits. Also, institutions experiencing or projecting lower capital levels that may trigger brokered and high interest rate deposit restrictions should adjust deposit assumptions accordingly.

Prepayment assumptions are important considerations when measuring optionality risk. Prepayment risk (or conversely, extension risk) on loans and mortgage-related securities are highly influenced by the direction of interest rates. Prepayment assumptions may also be affected by factors such as loan size, geographic area, credit score, and fixed versus variable rates. It is critical that assumptions be reasonable for each rate scenario measured. For example, in an increasing rate environment, prepayment assumptions should typically reflect lower prepayments than in a declining rate environment.

Financial institutions may actively track internal prepayment data or obtain prepayment statistics from external sources. Management should consider the reliability and applicability of external data and be cognizant that market stress, externalities, or a change in the institution's condition may influence customer behaviors.

Management should ensure that assumptions are appropriate given the characteristics of the institution's various portfolios (i.e., prepayment speeds for a portfolio of five percent loans would likely differ from a portfolio of eight percent loans). In addition, proper aggregation of the assets is necessary before applying assumptions.
Documentation and support of all significant assumptions, including projected rates, spreads, customer behaviors, and NMD rates should be maintained and available for examiner review. Some measurement systems have only limited ability to change model assumptions, in which case documentation may be limited. Even in those cases, an analysis of the applicability of the embedded assumptions to the subject bank should be performed and maintained. More complex systems entail a vast array of assumptions, and thorough documentation of every assumption cannot be realistically expected. However, management should thoroughly support and document assumptions related to the most significant institution or model risks.

Measurement System Reports

Many measurement systems are capable of providing summary reports detailing key model assumptions. Examiners should review a copy of these reports when analyzing a measurement system.

Most asset/liability management systems offer an array of summary reports (such as a chart of accounts and account attribute reports) that aid management in reviewing measurement system assumptions. These reports may also provide information regarding the contractual terms and parameters that have been entered into the system for various account types and financial instruments.

If an institution is unable to provide assumption summaries, examiners should determine whether the absence of the report is due to measurement system limitations or bank personnel's lack of familiarity with system capabilities. Typically, measurement system user manuals will provide a list of reports that may be generated by the system.

Assumption summary reports are an important tool that management and examiners can use to ensure that reasonable assumptions have been entered into the measurement system. The reports can also be useful to examiners when management does not maintain adequate documentation of current assumptions. For example, when assumption summary reports are regularly produced and retained, examiners can compare current assumptions against historical assumption reports.

To ensure proper controls over significant assumption changes, management should establish procedures for reviewing the reasonableness of assumption changes and for approving those changes before they occur.

Measurement System Results

After data and assumptions have been input, the IRR measurement system performs calculations. The calculations measure the IRR in the bank's assets, liabilities, and off-balance sheet items. The measurement system should generate summary reports that highlight the bank's sensitivity to changes in market rates given various interest rate scenarios. These reports typically indicate the change in net income or net interest income and/or economic value of equity. Some systems may also provide a gap report highlighting asset/liability mismatches over various time horizons. More detailed reports may be available on some systems that can be used to test the reasonableness, consistency, and accuracy of the output. They may also assist the examiner in identifying or verifying the system's underlying assumptions.

Management should have formalized procedures in place for reviewing measurement system results and reporting to the board or a board committee. Reports provided to the board and senior management should be clear, concise, timely, and informative in order to assist the board and senior management in making decisions. The results of the measurement system should also highlight deviations from board-approved IRR exposure limits. Examiners should review follow-up actions and communication relevant to any material breaches in board-approved limits. Examiners should also review the presentations or analyses provided to senior management, board members, and the ALCO, as well as any relevant meeting minutes.

Variance Analysis

Variance analysis (also known as back-testing) can provide valuable insights into the accuracy and reasonableness of IRR models and is an integral part of the control process for IRR management. Variance analysis involves identifying material differences between actual and forecasted income statement and balance sheet amounts and ascertaining the causes of the differences. Variances can be readily identified by direct comparison of the financial statements for a particular forecast period, or by using key financial indicators, such as net interest margin, cost of funds, or asset-yield comparisons.

Variance analysis can help management understand the primary reasons for material differences between projected and actual results. It can also provide a means to improve the precision of the IRR measurement system. Periodic variance analysis helps assure management and the board that the system is accomplishing its primary goal of providing meaningful information on the level of IRR. Variance analysis provides an opportunity for a deeper understanding of both the system and its results.

Variance analysis should be done periodically and no less frequently than annually. Further, management should document their analysis, highlighting any material variances, the primary cause of identified variances, and any proposed or implemented corrective actions.

Variances resulting from errors can be broken down into three major components: input, modeling, or assumption errors. When conducting variance analysis, management should attempt to pinpoint the cause of all material variances. Mathematical flaws, while relatively rare in widely available purchased systems, can occur. Other types of modeling errors can be caused by inaccurate data input, user unfamiliarity with the model, over-aggregation of account types, or the use of a model with insufficient capabilities.

Data errors can be minimized by strong internal controls and may be identified through selective transaction testing. Many models can compare the results of historical IRR simulations with actual financial results. Significant variances can help management identify, and subsequently correct, identified issues with the model setup, such as inappropriate account aggregations or the failure to include key account characteristics.

Assumption Variance Analysis

All IRR measurement systems rely heavily on a series of assumptions, and assessing their reasonableness is critical to ensuring the integrity of the measurement system results. Just as actual financial results can be expected to vary from forecasts, the assumptions that form the basis of that forecast can be expected to vary from actual events.

Institutions should have formalized procedures for periodically identifying material differences between assumed and realized values. Formal procedures help identify the key reasons for variances. Even if material financial variances are absent, the model's significant assumptions should be compared to actual performance. Compensating differences may have masked important variances. For example, an institution with a large mortgage portfolio may find that actual prepayment speeds were significantly higher than projected, but new loan production replaced the run-off. In this case, there may only be an immaterial variance in the ending loan balance, but a significant variance in projected vs. actual prepayments.

Given the large number of assumptions inherent in most measurement systems, a thorough review of every assumption during each measurement cycle is unrealistic. However, key assumptions should be checked against actual behaviors on a regular basis. Key assumptions include those dealing with interest rate movements, driver rates, non-maturity deposits, prepayment speeds, and account aggregations. Variance analysis should be used to identify the differences attributable to rate assumptions and other factors in order to better understand how those factors influenced modeled results.

Driver rate variances occur when the expected correlation between a bank rate and its driver rate does not act as predicted. Variance analysis is used to determine the significance of the difference and should address whether the difference is due to an inaccurate correlation between the subject and driver rate, or due to inappropriate spreads or beta factors. Ideally, the relationship between subject and driver rates should be documented, and the relationship should factor in historical correlations and management's intentions regarding future movements.

Non-maturity deposit assumptions may cause significant variances. If the measurement system forecast an increasing net interest margin in a rising rate environment, while the actual margin declined, the cause may involve NMD assumptions. Many models treat NMD rates as very insensitive to yield curve changes, while actual practices are to manage the rates more actively. This can lead to model measurements that show the bank as asset sensitive or neutral, when past performance shows it to be liability sensitive. Periodic variance analysis may identify this discrepancy and allow management to more effectively use the IRR measurement tool. *Note:* Examiners should recognize that models are forward looking; therefore the usefulness of historical variance analysis may be limited.

Prepayment speed variances occur when actual prepayments do not mirror those projected. Variances are not uncommon as the cash flows are difficult to model and predict; however, management should monitor prepayments and revise related assumptions if material variances occur.

Inappropriate account aggregation can also lead to significant variances. For example, when comparing actual and modeled loan interest income, an institution may find that the model overestimated income in a falling rate environment because real estate loans with significantly different prepayment characteristics were aggregated together.

Many models measure static IRR, that is, what would happen to the current balance sheet if only interest rates changed. Other models incorporate management projections about asset and liability growth and changes in product mix. Variance analysis in the latter instance is complicated by the need to segregate variances due to balance sheet changes from those caused by rate movements.

←

OTHER RISK FACTORS TO CONSIDER

Although IRR is the principal market risk taken by most financial institutions, other activities can significantly increase (or reduce) a bank's exposure and sensitivity to market risk.

Foreign exchange activities expose institutions to the price (exchange rate) risk that results from volatile currency markets. Exchange rates depend upon a variety of global and local factors that are difficult to predict, including interest rates, economic performance, central bank actions, and political developments.

Commodity activities involve using commodity contracts (including futures and options) to speculate or hedge. Commodity prices depend upon many factors and are very difficult to forecast.

Generally, institutions should only use foreign exchange or commodity activities to hedge or control specific market risks. Management, independent of the broker/dealer, should demonstrate expertise commensurate with the activities undertaken. In addition, management should produce documented analysis that clearly details the effectiveness of all foreign exchange and commodity hedging activities. The analysis should be prepared at least quarterly and presented to the board for its review. *Note:* Typical commodity hedging activities are significantly different from speculative commodity activities.

Equity trading and investing creates market risk exposure because changes in equity prices can adversely affect earnings and capital. The board and management have a responsibility to identify, measure, monitor, and control trading risks. Management should carefully monitor all equity investments, regularly evaluate the resulting market risk exposure, and provide timely reports to the board.

Foreign exchange, commodities, and equity trading requires a high level of technical and managerial expertise. The risk management and measurement systems needed to operate them effectively are likewise highly sophisticated and require rigorous monitoring and testing. Foreign exchange, commodity, or equity speculation, absent the necessary controls and sufficient capital, might be considered an unsuitable practice. When necessary, contact legal counsel or capital markets specialists in your region for additional guidance.

Interest Rate Risk Mitigation

Institutions can use several measures to mitigate IRR exposures. If risk measures fall outside approved tolerance guidelines and trigger corrective steps (which should be guided by approved policies), management might alter their balance sheet or engage in hedging activities. Hedging strategies often involve using complex derivative instruments and are not suitable for institutions lacking technical expertise. When any IRR mitigation strategy is considered, management should also consider other risks, such as credit, liquidity, and operational risks.

When implementing IRR mitigation techniques, the board and management should ensure that policies and approved strategies address:

- Analysis of market, liquidity, credit, and operating risks;
- Qualifications of personnel involved in implementing and monitoring hedging strategies;
- Permissible strategies and types of derivative contracts;
- Authority levels and titles of individuals approved to initiate hedging transactions and related authority limits;
- Risk limits for hedging activities such as position limits (gross and net), maturity parameters, and counterparty credit guidelines;
- Monitoring requirements for hedging activities, including ensuring activities fall within approved limits and management lines of authority; and
- Controls for ensuring management's compliance with technical accounting guidance that covers hedging activities.

Institutions should not use derivative instruments for hedging (whether or not hedge accounting is applied), unless the board and senior management fully understand the institution's strategy and the potential risks and benefits. Relying on outside consultants to assist with a hedging strategy does not absolve the board and senior management of their responsibility to understand and oversee the risks of the activities. Hedging strategies should be designed to limit downside earnings exposure or manage income or EVE volatility. Activities conducted solely to generate additional income should not be considered hedging.

Altering the balance sheet is the most common method institutions use to modify their IRR position. However, this strategy may take time to implement and often cannot quickly correct significant exposures. For example, if a bank is liability sensitive and therefore exposed to rising interest rates, management may decide to reduce their retention of 30-year fixed-rate mortgages. Strategies may include increased sales (possibly for securitization) of longer-term mortgage products or pricing longer-term mortgages above market rates in order to reduce the volume of new loan originations. While this strategy may reduce IRR over time, this method can be slow in correcting material IRR imbalances and may not effect a timely reduction in risk exposures.

Institutions may also attempt to address exposures to rising interest rates by increasing longer-term deposit or borrowing levels. However, several factors may hinder the success of such strategies. There may be significant competition or limited demand for longer-term time deposits, and access to longer-term wholesale funding may be limited or offered on unfavorable terms. Additionally, embedded options (e.g., calls and step-up dates) in wholesale funding sources can present measurement challenges, and the cost of such funding can make this approach prohibitive unless there is a clear productive use for the funds.

Cash flow matching and duration matching are two typical hedging strategies. The goal of these strategies is to change a bank's IRR exposure to meet specific cash flow or duration targets. These strategies can be accomplished by altering the balance sheet composition or through the use of derivatives.

Some institutions refer to cash flow matching as matched funding. The bank matches the terms (rate or maturity) of funding and assets so that cash flows will reprice or mature simultaneously and interest rate changes will not significantly influence net cash flow. Cash flow matching can be difficult for small institutions due to the wide range of cash flows in most financial assets.

With a duration matching strategy, management may attempt to match the duration of a pool of assets with the duration of a pool of liabilities. The use of interest rate derivatives or options might also be used to modify or offset the duration of an existing pool of assets or liabilities. The goal is to match the effective durations of the pools in order to limit the net changes in fair values of the pools, rather than matching the specific cash flows. Duration matching is not a perfect strategy and may result in imperfect hedging from a cash flow perspective and can cause exposure to different kinds of risk (such as yield curve and basis risk).

Derivative instruments are available to hedge IRR. These instruments include, but are not limited to, swaps, amortizing swaps, basis swaps, futures, forwards, caps, options, floor options, and collars. The most common derivatives used to hedge IRR are swaps and forwards. In a pay-fixed swap transaction, a stream of fixed interest payments from a commercial loan may be contractually exchanged for a stream of floating-rate payments. This swap effectively shortens the duration of the commercial loan portfolio by reducing the asset/liability mismatch and improves profitability in a rising-rate environment. Conversely, the bank could lengthen the effective duration of its floating-rate deposits by entering into a swap where a floating-rate stream of payments is exchanged for a fixed-rate payment stream.

Institutions that use hedging activities should understand the true impact of a hedge (whether it actually decreases risks), and understand its impact on earnings and capital. All derivatives require fair value accounting adjustments, which may result in earnings and capital volatility. While management may utilize hedges to reduce certain risks in their portfolio, analysis of the hedges should consider the impact of related accounting adjustments on earnings and capital.

Each institution using derivatives should establish an effective process for managing related risks. The level of formality in this process should be commensurate with the activities involved and the level of risk approved by senior management and the board.

←

INTERNAL CONTROLS

Establishing and maintaining an effective system of internal controls and independent reviews is critical to the risk management process and the general safety and soundness of the bank. Institutions should have adequate internal controls to ensure the integrity of their IRR management process. These controls should promote reliable financial reporting and compliance with internal policies and relevant regulations. Internal control policies and procedures should address appropriate approval processes, adherence to exposure limits, reconciliations, reporting, reviews, and other mechanisms designed to provide a reasonable assurance that the bank's IRR management objectives are achieved. Internal control policies and procedures should clearly define management authorities and responsibilities and identify the individuals and committees responsible for managing sensitivity to market risk.

A sound control environment should also ensure adequate separation of duties in key elements of the risk management process to avoid potential conflicts of interest. Institutions should have clearly defined duties that are sufficiently independent from position-taking functions of the bank. Additionally, IRR exposures should be reported directly to senior management and the board of directors. The nature and scope of such safeguards should reflect the type and structure of the bank, the volume and complexity of IRR incurred by the bank, and the complexity of its transactions and commitments. More complex institutions should have an independent unit responsible for the design and administration of the bank's IRR measurement, monitoring, and control functions.

Independent Reviews

Regular independent reviews of its IRR management process are an important element of a bank's internal control system. Internal reviews of the IRR measurement system should include assessments of the assumptions, parameters, and methodologies used. Such reviews should seek to understand, test, and document the current measurement process, evaluate the system's accuracy, and recommend solutions to any identified weaknesses. The independent review should be tailored to the type and complexity of an institution's activities and encompass the standards and desirable scope discussed below. Regardless of the depth of the independent review, the findings of the review should be reported to the board no less frequently than annually, along with a summary of the bank's IRR measurement techniques and management practices.

Independent Review Standards

The purpose of an independent review is to ensure that the IRR measurement and management processes are sound. Regardless of whether the review is performed by internal staff or external entities, it is important these parties be independent of any operational responsibility for the measurement and management processes. They should not perform any of the routine internal control functions such as reconciling data inputs, developing assumptions, or performing variance analysis.

Independent reviews should be performed at least annually. The scope, responsibility, and authority for the reviews should be clearly documented and encompass all material aspects of the measurement process. The scope of the independent review should generally be defined by the internal audit staff and approved by the audit committee. However, subject to board approval, it is acceptable for another department of the bank, separate from the group that measures IRR, to define, perform, and document the independent review. A bank's review processes should meet the following minimum standards:

- Independence - Parties performing the independent review should not be involved in the day-to-day IRR measurement/management process. Institutions may use internal staff, an outsourcing arrangement, or a combination of the two to independently review the measurement system. Management may find that the internal audit department, or other staff independent of the measurement system, has the knowledge and skills to perform certain aspects of the review while using external resources for other areas. When the assessment of the measurement system is outsourced, senior management and the board should ensure that the procedures used meet the same standards required of a satisfactory internal review.
- Skills and Knowledge - Senior management and the board must ensure that individuals performing the independent review have the knowledge and skills to competently assess the measurement system and its control environment.
- Transparency - The procedures used in the independent review of the measurement system should be clearly documented, and work papers should be available to management, auditors, and examiners for review. Senior management should ensure that they have access to work papers even when external parties perform the review.
- Communication of Results - Procedures should be established for reporting independent review findings at least annually to the board or board-delegated committee.

Scope of Independent Review

Independent reviews provide a way to assess the adequacy of a bank's IRR measurement system. The level and depth of the independent reviews should be commensurate with the bank's risks and activities. More complex institutions should have a more rigorous independent review process. Less complex institutions may rely upon less formal reviews. At a minimum, each institution should have procedures in place to independently review the input process, assumptions used, and system output reports.

System-input reviews should evaluate the adequacy and appropriateness of:

- The knowledge and skills of individuals responsible for input to the measurement system;
- The reconciliation of the measurement system's data

to the bank's general ledger;
- The rules and methods of account aggregation used in the measurement system;
- The accuracy of contractual terms captured within the measurement system; and
- The source, completeness, accuracy, and procedures for external data feeds.

Assumption reviews should evaluate the following issues:

- The process of developing assumptions for all material asset, liability, and off-balance sheet exposures;
- The process for reviewing and approving key assumptions;
- The periodic review of assumptions for relevance, applicability, and reasonableness; and
- The completeness of assumption analysis and its supporting documentation.

System output and reporting assessments should include coverage of the following:

- Inclusion of a sufficiently broad range of potential rate scenarios,
- Accuracy of the IRR measurement and assurance that all material exposures are captured,
- Timeliness and frequency of reporting to management and the board,
- Compliance with operating policies and approved risk limits,
- Performance and documentation of variance analyses (back-testing), and
- Translation of model output into understandable management reports that support decision making.

Theoretical and Mathematical Validations

The degree to which calculations in an IRR model should be validated depends on the complexity of an institution's activities and IRR model. The complexity of many measurement systems demands specialized knowledge and skills to verify the mathematical equations. Less complex institutions using simpler, vendor-supplied IRR models can satisfy some, but not all, validation requirements with independent attestation reports from the vendor.

Management should periodically discuss with vendors what validation and internal control process assessments have been conducted. The vendor should provide documentation showing a credible, independent third party has performed such assessments. Vendors should be able to provide appropriate testing results to show their product works as expected. They should also clearly indicate the model's limitations, assumptions, and where the product's use may be problematic. Such disclosures, exclusive of confidential or proprietary information, should contain useful insights regarding a model's functionality and outputs. However, a certification or validation report from a vendor is only one component of a bank's independent review and should not be used as a substitute for an overall validation review. Management is still responsible for any aspect of the process under their control, such as data input, assumption changes, etc.

As part of the validation process, management should ensure that the software and mathematics of the IRR model function as intended. Many community institutions use largely standardized, vendor-provided models. In such cases, the validations provided by vendors can be used to support the accuracy of the model. For models that are customized to an individual institution or in situations where vendors are unable or unwilling to provide appropriate certifications or validations, management is responsible for validating the accuracy of the model's mathematics and soundness of the software.

Additionally, vendor models may be customized by an institution for its particular circumstances. Management should document and justify the institution's customization choices as part of the validation process. If vendors provide input data or assumptions, their relevance to the bank's situation should be evaluated and approved. Institutions should obtain information regarding the data (e.g., vendor-derived assumptions) used to develop the model and assess whether the data is representative of the institution's situation.

Complex institutions or those with significant IRR exposures may need to perform more in-depth validation procedures of the underlying mathematics. Validation practices could include constructing a similar model to test assumptions and outcomes or using an existing, well-validated benchmark model, which is often a less costly alternative. The benchmark model should have theoretical underpinnings, methodologies, and inputs that are very close to those used in the model being validated. More complex institutions have used benchmarking effectively to identify model errors that could distort IRR measurements. The depth and extent of the validation process should be consistent with the degree of risk exposures.

Model certifications and validations commissioned by vendors can be a useful part of an institution's efforts to evaluate the model's development and conceptual soundness. Although many vendors offer services for process verification, benchmarking, or back-testing, the services are usually separate engagements. Each institution should ensure these engagements meet its internal policy requirements for validations and independent reviews.

EVALUATING SENSITIVITY TO MARKET RISK

The sensitivity to market risk component reflects the degree to which changes in interest rates, foreign exchange rates, commodity prices, or equity prices can adversely affect a financial institution's earnings or economic capital. When evaluating this component, consideration should be given to: management's ability to identify, measure, monitor, and control market risk; the institution's size; the nature and complexity of its activities; and the adequacy of its capital and earnings in relation to its level of market risk exposure.

For many institutions, the primary source of market risk arises from nontrading positions and their sensitivity to changes in interest rates. In some larger institutions, foreign operations can be a significant source of market risk. For some institutions, trading activities are a major source of market risk.

Market risk is rated based upon, but not limited to, an assessment of the following evaluation factors:

- The sensitivity of the financial institution's earnings or the economic value of its capital to adverse changes in interest rates, foreign exchanges rates, commodity prices, or equity prices.·
- The ability of management to identify, measure, monitor, and control exposure to market risk given the institution's size, complexity, and risk profile.
- The nature and complexity of interest rate risk exposure arising from nontrading positions.
- Where appropriate, the nature and complexity of market risk exposure arising from trading and foreign operations.

Ratings

1. A rating of 1 indicates that market risk sensitivity is well controlled and that there is minimal potential that the earnings performance or capital position will be adversely affected. Risk management practices are strong for the size, sophistication, and market risk accepted by the institution. The level of earnings and capital provide substantial support for the degree of market risk taken by the institution.

2. A rating of 2 indicates that market risk sensitivity is adequately controlled and that there is only moderate potential that the earnings performance or capital position will be adversely affected. Risk management practices are satisfactory for the size, sophistication, and market risk accepted by the institution. The level of earnings and capital provide adequate support for the degree of market risk taken by the institution.

3. A rating of 3 indicates that control of market risk sensitivity needs improvement or that there is significant potential that the earnings performance or capital position will be adversely affected. Risk management practices need to be improved given the size, sophistication, and level of market risk accepted by the institution. The level of earnings and capital may not adequately support the degree of market risk taken by the institution.

4. A rating of 4 indicates that control of market risk sensitivity is unacceptable or that there is high potential that the earnings performance or capital position will be adversely affected. Risk management practices are deficient for the size, sophistication, and level of market risk accepted by the institution. The level of earnings and capital provide inadequate support for the degree of market risk taken by the institution.

5. A rating of 5 indicates that control of market risk sensitivity is unacceptable or that the level of market risk taken by the institution is an imminent threat to its viability. Risk management practices are wholly inadequate for the size, sophistication, and level of market risk accepted by the institution.

Examination Standards and Goals

The following documents provide additional guidance for managing IRR:

- Joint Agency Policy Statement on Interest Rate Risk,
- Interagency Advisory on Interest Rate Risk Management, and
- Interagency Advisory on Interest Rate Risk Management Frequently Asked Questions.

Interagency Policy Statement on Interest Rate Risk

In 1996, the FDIC and the other Federal banking regulators adopted the Sensitivity to Market Risk component of the Uniform Financial Institutions Rating System and issued a Joint Agency Policy Statement on IRR (Policy Statement). The Policy Statement identifies the key elements of sound IRR management and describes prudent principles and practices for each of these elements. It emphasizes the importance of adequate oversight by a bank's board of directors and senior management as well as the importance of comprehensive risk management processes. The Policy Statement also describes the critical IRR-related factors that affect the Agencies' evaluation of an institution's capital adequacy

Interagency Advisory-Interest Rate Risk Management

In January 2010, the Agencies issued updated guidance to clarify supervisory expectations for IRR management set forth in the 1996 Policy Statement. The Interagency Advisory on Interest Rate Risk Management (Advisory) re-emphasizes the importance of effective corporate governance, policies and procedures, risk measurement and monitoring systems, stress testing, and internal controls related to IRR exposures. The Advisory indicates financial institutions should manage IRR commensurate with their complexity, risk profile, business model, and scope of operations. Additionally, the Advisory highlights that effective IRR management involves not only the identification and measurement of IRR, but also appropriate risk mitigation strategies that may be used to control IRR if exposure levels warrant corrective steps.

In January 2012, the agencies published supplemental guidance addressing Frequently Asked Questions (FAQs) on the 2010 Advisory. The FAQs provides additional clarification on topics such as determining model appropriateness; defining meaningful stress scenarios; analyzing yield curve, basis, and option risk, as well as using no-growth measurement scenarios. The FAQs also describe effective procedures for model validations and calculation of non-maturity deposit decay assumptions.

←

EXAMINATION PROCESS

FDIC examination procedures follow a risk-focused framework that incorporates the guidelines outlined in the 1996 Policy Statement and the 2010 Advisory (including the FAQs guidance) to efficiently allocate examination resources. The scope of an examination should consider a bank's IRR exposure relative to earnings and capital, the complexity of on- and off-balance sheet exposures, and the strength of risk management processes.

Examiners can identify material exposures and risks by reviewing the following items (most of which are available during off-site analysis):

- Prior examination findings,
- Interest Rate Risk Standard Analysis (IRRSA),
- Net interest margin and net operating income trends,
- Board or committee minutes,
- Bank IRR analysis,
- Independent review or audit findings,
- Related bank policies and procedures,
- Balance sheet and account data,
- Strategic and business plans,
- Product pricing guidelines, and
- Derivatives activities.

Citing Examination Deficiencies

Material weaknesses in risk management processes, or high levels of IRR exposure relative to capital, require corrective action. Such actions may include recommendations or directives to:

- Raise additional capital;
- Reduce levels of IRR exposure;
- Strengthen IRR management expertise;
- Improve IRR management information and measurement systems; or
- Take other measures or combination of actions, depending on the facts and circumstances of the individual bank.

If an examiner determines that IRR weaknesses warrant the listing of a contravention of regulatory guidance in the Report of Examination, the 1996 Policy Statement should be cited as the source guidance. Examiners may reference the Advisory or the FAQs document in supporting comments. A contravention of the interagency guidelines detailed in Appendix A of Part 364 may also be warranted for institutions with seriously deficient IRR programs.

Pursuant to Appendix A (II.E.) of Part 364, an institution should:

- Manage interest rate risk in a manner that is appropriate to the size of the institution and the complexity of its assets and liabilities; and
- Provide for periodic reporting to management and the board of directors regarding interest rate risk with adequate information for management and the board of directors to assess the level of risk.

Note: Accepting a reasonable degree of IRR is a fundamental part of banking that significantly affects profitability and shareholder values. Although risks must be properly managed, exceptions to established IRR policies and limits occasionally occur. Examiners should not automatically criticize relatively minor exceptions to established policies or internal limits if an institution has appropriate, formal processes for monitoring, reviewing, and approving exceptions.

Additionally, examiners are reminded that, if weaknesses in a model or its assumptions are identified that render its results unreliable, report comments supporting the assigned rating should not rely on (or, at a minimum, should qualify any use of) the resulting data.

←

MARKET RISK GLOSSARY

Deterministic Rate Scenarios

Deterministic modeling techniques allow management to specify the direction, amount, and timing of future interest rates in order to measure the potential impact the changes may have on earnings and capital. The following items are examples of commonly used deterministic interest rate scenarios:

- **Rate Shock Scenario** – In this scenario, rate changes are immediate and sustained. For example, in a plus 300 basis point scenario, the full effect of the rate increase would be administered in the first period measured and remain in effect for all periods.
- **Rate Ramp Scenario** – In this scenario, rate changes are applied gradually over the measured period. For example, when measuring the effects of a 300 basis point rate increase during a 12-month period, rates would be increased 25 basis points each month.
- **Stair Step Scenario** – In this scenario, rate changes are administered at less frequent intervals over the measured period. For instance, in a 300 basis point increasing rate environment measured over a two-year time period, rates may be increased 50 basis points each quarter of the first year and 25 basis points each quarter of the second year.

Non-parallel Yield Curve Shifts

A shift in the yield curve in which yields do not change by the same number of basis points for every maturity. When running various interest rate scenarios, management may set non-parallel shifts in a manner similar to deterministic rate scenarios (rate shock, rate ramp, or stair step). The scenarios often have a pivot point on the yield curve from which longer-term and shorter-term rates change in different amounts.

Static Models

Static simulation models are based on current exposures and assume a constant, no-growth balance sheet. In order to simulate no growth in balance sheet accounts, some static models assume that all principal cash flows from a particular account are reinvested back into that same account. This assumption is sometimes referred to as replacement growth.

Dynamic Models

Dynamic simulation models rely on detailed assumptions regarding changes in existing business lines, new business, and changes in management and customer behavior. The assumptions change the existing balance sheet to reflect expected business changes.

Stochastic Models

Stochastic modeling consists of the modeling of an uncertain variable over time using a random selection process. It recognizes that market variables, such as interest rates, exhibit a general trend (drift) and some degree of volatility around that trend. Stochastic models provide a framework for the evaluation of the impact of embedded options in financial instruments.

Constraints are usually imposed so that the model is representative of current market conditions. For example, if Treasury securities are priced using interest rate paths, a constraint may be imposed so that the average present value derived from all the paths must equal the observed market price of the Treasury securities. In such a case, the model can also be classified as a Stochastic No Arbitrage Model.

Monte Carlo Simulation

A Monte Carlo simulation randomly generates a large sample set of values from a reasonable population of variables such as an interest rate. The stochastic model provides a framework for the evolution of the variable, and a Monte Carlo simulation is an application of that stochastic model. The randomness in games of chance is similar to how Monte Carlo simulation selects values at random to simulate a model. When you turn a roulette wheel, you know that one number within a range of numbers will come up, but you do not know which number will come up for any particular turn. The same concept applies with a Monte Carlo simulation where the variables (e.g., interest rates, security prices) have a known range of values but an uncertain value for any particular time. Monte Carlo simulations can take into account returns, volatility, correlations, and other factors. Monte Carlo programs can generate millions of different scenarios by randomly changing a component for each run or iteration. Monte Carlo simulation allows the banker to simulate thousands of market-like scenarios and learn the probability of a particular outcome or a range of outcomes. Assume that the investment portfolio is run through 20,000 simulations, projecting 20,000 separate scenarios over a two-year period, and acceptable results occur 16,000 times. This means that there is an 80 percent probability that the portfolio will perform at an acceptable level. Like any financial model, the results are sensitive to underlying assumptions. The number of runs or simulations is also important. For example, a Monte Carlo model with only 500 iterations captures fewer possible scenarios than one that runs 50,000 iterations.

Spread Types

- **Static Spread –** Basis points, that when added to a set of implied forward rates, discounts the cash flows of an instrument back to its observed market value. For an instrument without embedded optionality, the static spread is the best measure of return in excess of the risk-free rates provided by that instrument. For instruments with embedded optionality, it may be useful to calculate a static spread only as a starting point for comparison with a more appropriate mark-to-market spread measure, such as the option adjusted spread.
- **Option Adjusted Spread (OAS) –** Basis points, that when added to a set of interest rates discounts the cash flows of an instrument back to its observed market value. This measure only applies to instruments with embedded optionality. The static spread applies to instruments without embedded optionality. For example, consider a mortgage-backed security, which typically contains an embedded prepayment option. Assume the static spread is 75 basis points. The OAS would be less than the static spread of 75 basis points because the volatility of interest rates reflected in an OAS framework assigns more value to the borrower's prepayment option, thus reducing the value to the MBS investor.
- **OAS Process** – In a stochastic valuation model, the average value generated by all the interest rate paths must equal the currently observed price of the security. The initial computation in the model is based on an assumed spread. The security value derived is compared to the observed.

Duration Calculations

Macaulay duration calculates the weighted average term to maturity of a security's cash flows. Assume a bond with three years remaining to maturity, bearing a 5 percent coupon rate paid annually, when a 10 percent yield is required.

Macaulay Duration Calculation
3 year bond, 5% coupon, 10% yield

Year	Payment	PV x	T	PVxT
1	$50	$45.5 x	1 =	$45.5
2	$50	$41.3 x	2 =	$82.6
3	$1,050	$788.9 x	3 =	$2,366.7
Total		$875.7		$2,494.8

T = Time period payment is received

Macaulay Duration: 2,494.8 / 875.7 = 2.85 years

Modified duration, calculated from Macaulay duration, estimates price sensitivity for small interest rate changes.

Modified Duration Calculation
3 year bond, 5% coupon, 10% yield
Macaulay Duration = 2.85 years

$$\frac{\text{Macaulay Duration}}{1 + (\text{Yield} / n)}$$
$$= 2.85 / 1.10$$

n = coupons per year

Modified Duration = 2.59%

The following formula can be used to estimate the percentage change in a bond's price:

$$\Delta\ \% = -\text{Modified Duration x } \Delta \text{ Yield x } 100$$

Note: The minus sign recognizes the inverse relationship of price and yield.

For a 100 basis point change in rates, the estimated change in price is equal to the modified duration. In other words, using a modified duration of 2.59 percent, the price of a bond would change approximately 2.6 percent for every 100 basis point change in rates. If rates changed by only 50 basis points, the bond would change approximately 1.3 percent.

$$\Delta\% = \text{Modified Duration x } \Delta \text{ Yield x } 100$$
$$= 2.59\% \text{ x } 50\text{bp x } 100$$
$$= 2.59\% \text{ x } .5$$
$$= 1.295\%$$

The following formula can be used to estimate the dollar change in price:

$$\Delta\$ = \text{minus Price x Modified Duration x } \Delta \text{ Yield x } 100$$

If the price of the bond had been $875.66, then its approximate change in value (price), if rates changed by 50bp, would be ($875.66) x 1.295% = ($11.34).

If rates fell, the estimated value would be $887.00, while if rates rose the estimated value would fall to $864.32.

Duration-based price forecasts are generally precise when used with small rate changes (1 to 5 basis points). However, the accuracy of the forecasts decline when larger rates changes (especially 100 basis points or more) are involved. The reason for the declining accuracy of price forecasts relates to the non-linear relationship between prices and yields (a.k.a., convexity).

Convexity

Option-free financial instruments display positive convexity. When rates decline, a positively convexed instrument's price increases at an increasing rate. When rates rise, a positively convexed instrument's price decreases at a decreasing rate.

Negative convexity causes the duration of a security to lengthen when rates rise and shorten when rates fall. Instruments that contain embedded options demonstrate negative convexity. When rates decline, a negatively convexed instrument's price increases at a decreasing rate. When rates rise, the price of a negatively convexed instrument will decline at an increasing rate.

For example, the value of the treasury security changes relatively less in value in comparison to the sample mortgage security, which declines more significantly. However, as yields decrease, the treasury security gains value at an increasing rate, while the mortgage security gains only modestly. As interest rates decline, the likelihood increases that borrowers will refinance (exercise prepayment option). Therefore, the value of a mortgage security does not increase at the same rate or magnitude as a decline in interest rates.

Effective Duration and Effective Convexity

Effective duration and effective convexity are used to calculate the price sensitivity of bonds with embedded options. The calculations provide an approximate price change of a bond given a parallel yield curve shift. Measures of modified duration and convexity do not provide accurate calculations of price sensitivity for bonds with embedded options. Effective duration and convexity provide a more accurate view of price sensitivity since the measures allow for cash flows to change due to a change in yield. Formula:

Effective Duration = $(V_- - V_+)/(2V_0 \times \Delta Y)$
Effective Convexity = $(V_+ + V_- - 2V_0)/(2V_0 \times \Delta Y)^2$

Where, ΔY = Change in market interest rate used to calculate new values:

V_+ = Price if yield is increased by Change Y
V_- = Price if yield is decreased by Change Y
V_0 = Initial price per \$100 of par value

Assume: a three-year callable bond's current market value is \$98.60 (V_0); that interest rates are projected to change by 100 basis points (Y); that the price of this bond given a 100 basis point increase in rates is \$96.75 (V_+); and that the price of this bond given a 100 basis point decrease in rates is \$99.98 (V_-).

To calculate effective duration and convexity:

Effective Duration =
$(99.98 - 96.75)/(2(98.60)(.01)) = 1.64$
Effective Convexity =
$96.75 + 99.98 - 2(98.60) \div (2(98.60)(.01))^2 = -23.83$

If we assume interest rates increase 100 basis points, the approximate price change due to effective duration is the following:

Percentage Price Change = -Effective Duration x Yield Change
Percentage Change in Price = $-1.64 \times .01 = -1.64\%$

The approximate price change due to effective convexity is the following:

½ x Effective Convexity x (Yield Change)²
$\frac{1}{2} \times -23.83 \times (0.01)^2 \times 100 = -0.12\%$

Thus this bond's price would be expected to decrease by about 1.76 percent given a 100 bps rise in rates:

Effective Duration	=	-1.64%
Effective Convexity	=	-0.12%
		-1.76%

INTRODUCTION TO THE BANK SECRECY ACT

The Financial Recordkeeping and Reporting of Currency and Foreign Transactions Act of 1970 (31 U.S.C. 5311 et seq.) is referred to as the Bank Secrecy Act (BSA). The purpose of the BSA is to require United States (U.S.) financial institutions to maintain appropriate records and file certain reports involving currency transactions and a financial institution's customer relationships. Currency Transaction Reports (CTRs) and Suspicious Activity Reports (SARs) are the primary means used by banks to satisfy the requirements of the BSA. The recordkeeping regulations also include the requirement that a financial institution's records be sufficient to enable transactions and activity in customer accounts to be reconstructed if necessary. In doing so, a paper and audit trail is maintained. These records and reports have a high degree of usefulness in criminal, tax, or regulatory investigations or proceedings.

The BSA consists of two parts: Title I Financial Recordkeeping and Title II Reports of Currency and Foreign Transactions. Title I authorizes the Secretary of the Department of the Treasury (Treasury) to issue regulations, which require insured financial institutions to maintain certain records. Title II directed the Treasury to prescribe regulations governing the reporting of certain transactions by and through financial institutions in excess of $10,000 into, out of, and within the U.S. The Treasury's implementing regulations under the BSA, issued within the provisions of 31 CFR Part 103, are included in the FDIC's Rules and Regulations and on the FDIC website.

The implementing regulations under the BSA were originally intended to aid investigations into an array of criminal activities, from income tax evasion to money laundering. In recent years, the reports and records prescribed by the BSA have also been utilized as tools for investigating individuals suspected of engaging in illegal drug and terrorist financing activities. Law enforcement agencies have found CTRs to be extremely valuable in tracking the huge amounts of cash generated by individuals and entities for illicit purposes. SARs, used by financial institutions to report identified or suspected illicit or unusual activities, are likewise extremely valuable to law enforcement agencies.

Several acts and regulations expanding and strengthening the scope and enforcement of the BSA, anti-money laundering (AML) measures, and counter-terrorist financing measures have been signed into law and issued, respectively, over the past several decades. Several of these acts include:

- Money Laundering Control Act of 1986,
- Annuzio-Wylie Anti-Money Laundering Act of 1992,
- Money Laundering Suppression Act of 1994, and
- Money Laundering and Financial Crimes Strategy Act of 1998.

Most recently, the Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act (more commonly known as the USA PATRIOT Act) was swiftly enacted by Congress in October 2001, primarily in response to the September 11, 2001 terrorist attacks on the U.S. The USA PATRIOT Act established a host of new measures to prevent, detect, and prosecute those involved in money laundering and terrorist financing.

FINANCIAL CRIMES ENFORCEMENT NETWORK REPORTING AND RECORDKEEPING REQUIREMENTS

Currency Transaction Reports and Exemptions

U.S. financial institutions must file a CTR, Financial Crimes Enforcement Network (FinCEN) Form 104 (formerly known as Internal Revenue Service [IRS] Form 4789), for each currency transaction over $10,000. A currency transaction is any transaction involving the physical transfer of currency from one person to another and covers deposits, withdrawals, exchanges, or transfers of currency or other payments. Currency is defined as currency and coin of the U.S. or any other country as long as it is customarily accepted as money in the country of issue.

Multiple currency transactions shall be treated as a single transaction if the financial institution has knowledge that the transactions are by, or on behalf of, any person and result in either cash in or cash out totaling more than $10,000 during any one business day. Transactions at all branches of a financial institution should be aggregated when determining reportable multiple transactions.

CTR Filing Requirements

<u>Customer and Transaction Information</u>

All CTRs required by 31 CFR 103.22 of the Financial Recordkeeping and Reporting of Currency and Foreign

Transactions regulations must be filed with the IRS. Financial institutions are required to provide all requested information on the CTR, including the following for the person conducting the transaction:

- Name,
- Street address (a post office box number is not acceptable),
- Social security number (SSN) or taxpayer identification number (TIN) (for non-U.S. residents), and
- Date of birth.

The documentation used to verify the identity of the individual conducting the transaction should be specified. Signature cards may be relied upon; however, the specific documentation used to establish the person's identity should be noted. A mere notation that the customer is "known to the financial institution" is insufficient. Additional requested information includes the following:

- Account number,
- Social security number or taxpayer identification number of the person or entity for whose account the transaction is being conducted (should reflect all account holders for joint accounts), and
- Amount and kind of transaction (transactions involving foreign currency should identify the country of origin and report the U.S. dollar equivalent of the foreign currency on the day of the transaction).

The financial institution must provide a contact person, and the CTR must be signed by the preparer and an approving official. Financial institutions can also file amendments on previously filed CTRs by using a new CTR form and checking the box that indicates an amendment.

CTR Filing Deadlines

CTRs filed with the IRS are maintained in the FinCEN database, which is made available to Federal Banking Agencies[1] and law enforcement. Paper forms are to be filed within 15 days following the date of the reportable transaction. If CTRs are filed using magnetic media, pursuant to an agreement between a financial institution and the IRS, a financial institution must file a CTR within 25 calendar days of the date of the reportable transaction. A third option is to file CTRs using the Patriot Act Communication System (PACS), which also allows up to 25 calendar days to file the CTR following the reportable transaction. PACS was launched in October 2002 and permits secure filing of CTRs over the Internet using encryption technology. Financial institutions can access PACS after applying for and receiving a digital certificate.

Examiners reviewing filed CTRs should inquire with financial institution management regarding the manner in which CTRs are filed before evaluating the timeliness of such filings. If for any reason a financial institution should withdraw from the magnetic tape program or the PACS program, or for any other reason file paper CTRs, those CTRs must be filed within the standard 15 day period following the reportable transaction.

Exemptions from CTR Filing Requirements

Certain "persons" who routinely use currency may be eligible for exemption from CTR filings. Exemptions were implemented to reduce the reporting burden and permit more efficient use of the filed records. Financial institutions are not required to exempt customers, but are encouraged to do so. There are two types of exemptions, referred to as "Phase I" and "Phase II" exemptions.

"Phase I" exemptions may be granted for the following "exempt persons":

- A bank[2], to the extent of its domestic operations;
- A Federal, State, or local government agency or department;
- Any entity exercising governmental authority within the U.S. (U.S. includes District of Columbia, Territories, and Indian tribal lands);
- Any listed entity other than a bank whose common stock or analogous equity interests are listed on the New York, American, or NASDAQ stock exchanges (with some exceptions);
- Any U.S. domestic subsidiary (other than a bank) of any "listed entity" that is organized under U.S. law and at least 51 percent of the subsidiary's common stock is owned by the listed entity.

"Phase II" exemptions may be granted for the following:

- A "non-listed business," which includes commercial enterprises that do not have more than 50% of the business gross revenues derived from certain ineligible businesses. Gross revenue has been interpreted to reflect what a business actually earns from an activity conducted by the business, rather than the sales volume of such activity. "Non-listed businesses" must

[1] Federal Banking Agencies consist of the Federal Reserve Board (FRB), Office of the Comptroller of the Currency (OCC), Office of Thrift Supervision (OTS), National Credit Union Administration (NCUA), and the FDIC.

[2] Bank is defined in The U.S. Department of the Treasury (Treasury) Regulation 31 CFR 103.11.

also be incorporated or organized under U.S. laws and be eligible to do business in the U.S. and may only be exempted to the extent of its domestic operations.

- A "payroll customer," which includes any other person not covered under the "exempt person" definition that operates a firm that regularly withdraws more than $10,000 in order to pay its U.S. employees in currency. "Payroll customers" must also be incorporated and eligible to do business in the U.S. "Payroll customers" may only be exempted on their withdrawals for payroll purposes from existing transaction accounts.

Commercial transaction accounts of sole proprietorships can qualify for "non-listed business" or "payroll customer" exemption.

Exemption of Franchisees

Franchisees of listed corporations (or of their subsidiaries) are not included within the definition of an "exempt person" under "Phase I" unless such franchisees are independently exempt as listed corporations or listed corporation subsidiaries. For example, a local corporation that holds an ABC Corporation franchise is not a "Phase I" "exempt person" simply because ABC Corporation is a listed corporation; however, it is possible that the local corporation may qualify for "Phase II" exemption as a "non-listed business," assuming it meets all other exemption qualification requirements. An ABC Corporation outlet owned by ABC Corporation directly, on the other hand, would be a "Phase I" "exempt person" because ABC Corporation's common stock is listed on the New York Stock Exchange.

Ineligible Businesses

There are several higher-risk businesses that may not be exempted from CTR filings. The nature of these businesses increases the likelihood that they can be used to facilitate money laundering and other illicit activities. Ineligible businesses include:

- Non-bank financial institutions or agents thereof (this definition includes telegraph companies, and money services businesses [currency exchange, check casher, or issuer of monetary instruments in an amount greater than $1,000 to any person in one day]);
- Purchasers or sellers of motor vehicles, vessels, aircraft, farm equipment, or mobile homes;
- Those engaged in the practice of law, medicine, or accountancy;
- Investment advisors or investment bankers;
- Real estate brokerage, closing, or title insurance firms;
- Pawn brokers;
- Businesses that charter ships, aircraft, or buses;
- Auction services;
- Entities involved in gaming of any kind (excluding licensed para mutual betting at race tracks);
- Trade union activities; and
- Any other activities as specified by FinCEN.

Additional Qualification Criteria for Phase II Exemptions

Both "non-listed businesses" and "payroll customers" must meet the following additional criteria to be eligible for "Phase II" exemption:

- The entity has maintained a transaction account with the financial institution for at least twelve consecutive months;
- The entity engages in frequent currency transactions that exceed $10,000 (or in the case of a "payroll customer," regularly makes withdrawals of over $10,000 to pay U.S. employees in currency); and
- The entity is incorporated or organized under the laws of the U.S. or a state, or registered as, and eligible to do business in the U.S. or state.

The financial institution may treat all of the customer's transaction accounts at that financial institution as a single account to qualify for exemption. There may be exceptions to this rule if certain accounts are exclusively used for non-exempt portions of the business. (For example, a small grocery with wire transfer services has a separate account just for its wire business).

Accounts of multiple businesses owned by the same individual(s) are generally not eligible to be treated as a single account. However, it may be necessary to treat such accounts as a single account if the financial institution has evidence that the corporate veil has been pierced. Such evidence may include, but is not limited to:

- Businesses are operated out of the same location and/or utilize the same phone number;
- Businesses are operated by the same daily management and/or board of directors;
- Cash deposits or other banking transactions are completed by the same individual at the same time for the different businesses;
- Funds are frequently intermingled between accounts or there are unexplained transfers from one account to the other; or
- Business activities of the entities cannot be differentiated.

More than one of these factors must typically be present in order to provide sufficient evidence that the corporate veil has been pierced.

Transactions conducted by an "exempt person" as agent or on behalf of another person are not eligible to be exempted based on being transacted by an "exempt person."

Exemption Qualification Documentation Requirements

Decisions to exempt any entity should be based on the financial institution taking reasonable and prudent steps to document the identification of the entity. The specific methodology for performing this assessment is largely at the financial institution's discretion; however, results of the review must be documented. For example, it is acceptable to document that a stock is listed on a stock market by relying on a listing of exchange stock published in a newspaper or by using publicly available information through the Securities and Exchange Commission (SEC). To document the subsidiary of a listed entity, a financial institution may rely on authenticated corporate officer's certificates or annual reports filed with the SEC. Annually, management should also ensure that "Phase I" exempt persons remain eligible for exemption (for example, entities remain listed on National exchanges.)

For "non-listed businesses" and "payroll customers," the financial institution will need to document that the entity meets the qualifying criteria both at the time of the initial exemption and annually thereafter. To perform the annual reviews, the financial institution can verify and update the information that it has in its files to document continued eligibility for exemption. The financial institution must also indicate that it has a system for monitoring the transactions in the account for suspicious activity as it continues to be obligated to file Suspicious Activity Reports on activities of "exempt persons," when appropriate. SARs are discussed in detail within the "Suspicious Activity Reporting" section of this chapter.

Designation of Exempt Person Filings and Renewals

Both "Phase I" and "Phase II" exemptions are filed with FinCEN using Form TD F 90-22.53 - Designation of Exempt Person. This form is available on the Internet at FinCEN's website. The designation must be made separately by each financial institution that treats the person in question as an exempt customer. This designation requirement applies whether or not the designee has previously been treated as exempt from the CTR reporting requirements within 31 CFR 103. Again, the exemption applies only to transactions involving the "exempt person's" own funds. A transaction carried out by an "exempt person" as an agent for another person, who is the beneficial owner of the funds involved in a transaction in currency can not be exempted.

Exemption forms for "Phase I" persons need to be filed only once. A financial institution that wants to exempt another financial institution from which it buys or sells currency must be designated exempt by the close of the 30 day period beginning after the day of the first reportable transaction in currency with the other financial institution. Federal Reserve Banks are excluded from this requirement.

Exemption forms for "Phase II" persons need to be renewed and filed every two years, assuming that the "exempt person" continues to meet all exemption criteria, as verified and documented in the required annual review process discussed above. The filing must be made by March 15th of the second calendar year following the year in which the initial exemption was granted, and by every other March 15th thereafter. When filing a biennial renewal of the exemption for these customers, the financial institution will need to indicate any change in ownership of the business. Initial exemption of a "non-listed business" or "payroll customer" must be made within 30 days after the day of the first reportable transaction in currency that the financial institution wishes to include under the exemption. Form TD F 90-22.53 can be also used to revoke or amend an exemption.

CTR Backfiling

Examiners may determine that a financial institution has failed to file CTRs in accordance with 31 CFR 103, or has improperly exempted customers from CTR filings. In situations where an institution has failed to file a number of CTRs on reportable transactions for any reason, examiners should instruct management to promptly contact the IRS Detroit Computing Center (IRS DCC), Compliance Review Group for instructions and guidance concerning the possible requirement to backfile CTRs for those affected transactions. The IRS DCC will provide an initial determination on whether CTRs should be backfiled in those cases. Cases that involve substantial noncompliance with CTR filing requirements are referred to FinCEN for review. Upon review, FinCEN may correspond directly with the institution to discuss the program deficiencies that resulted in the institution's failure to appropriately file a CTR and the corrective action that management has implemented to prevent further infractions.

When a backfiling request is necessary, examiners should direct financial institutions to write a letter to the IRS at the IRS Detroit Computing Center, Compliance Review Group Attn: Backfiling, P.O. Box 32063, Detroit, Michigan, 48232-0063 that explains why CTRs were not filed. Examiners should also provide the financial institution a copy of the "Check List for CTR Filing Determination" form available on the FDIC's website. The financial institution will need to complete this form and include it with the letter to the IRS.

Once an institution has been instructed to contact IRS DCC for a backfiling determination, examiners should notify both their Regional Special Activities Case Manager (SACM) or other designees and the Special Activities Section (SAS) in Washington, D.C. Specific contacts are listed on the FDIC's Intranet website. Requisite information should be forwarded electronically via e-mail to these contacts.

Currency and Banking Retrieval System

The Currency and Banking Retrieval System (CBRS) is a database of CTRs, SARs, and CTR Exemptions filed with the IRS. It is maintained at the IRS Detroit Computing Center. The SAS, as well as each Region's SACM and other designees, has on-line access to the CBRS. Refer to your Regional Office for a full listing of those individuals with access to the FinCEN database.

Examiners should routinely receive volume and trend information on CTRs and SARs from their Regional SACM or other designees for each examination or visitation prior to the pre-planning process. In addition, the database information may be used to verify CTR, SAR and/or CTR Exemption filings. Detailed FinCEN database information may be used for expanded BSA reviews or in any unusual circumstances where examiners suspect certain forms have not been filed by the financial institution, or where suspicious activity by individuals has been detected.

Examiners should provide all of the following items they have available for each search request:

- The name of the subject of the search (financial institution and/or individual/entity);
- The subject's nine-digit TIN/SSN (in Part III of the CTR form if seeking information on the financial institution and/or Part I of the CTR form if seeking information on the individual/entity); and
- The date range for which the information is requested.

When requesting a download or listing of CTR and SAR information, examiners should take into consideration the volume of CTRs and SARs filed by the financial institution under examination when determining the date range requested. Except under unusual circumstances, the date range for full listings should be no greater than one year. For financial institutions with a large volume of records, three months or less may be more appropriate.

Since variations in spellings of an individual's name are possible, accuracy of the TIN/SSN is essential in ensuring accuracy of the information received from the FinCEN database. To this end, examiners should also identify any situations where a financial institution is using more than one tax identification number to file their CTRs and/or SARs. To reduce the possibility of error in communicating CTR and SAR information/verification requests, examiners are requested to e-mail or fax the request to their Regional SACM or other designee.

Other FinCEN Reports

Report of International Transportation of Currency or Monetary Instruments

Treasury regulation 31 CFR 103.23 requires the filing of FinCEN Form 105, formerly Form 4790, to comply with other Treasury regulations and U.S. Customs disclosure requirements involving physical transport, mailing or shipping of currency or monetary instruments greater than $10,000 at one time out of or into the U.S. The report is to be completed by or on behalf of the person requesting the transfer of the funds and filed within 15 days. However, financial institutions are not required to report these items if they are mailed or shipped through the postal service or by common carrier. Also excluded from reporting are those items that are shipped to or received from the account of an established customer who maintains a deposit relationship with the bank, provided the item amounts are commensurate with the customary conduct of business of the customer concerned.

In situations where the quantity, dollar volume, and frequency of the currency and/or monetary instruments are not commensurate with the customary conduct of the customer, financial institution management will need to conduct further documented research on the customer's transactions and determine whether a SAR should be filed with FinCEN. Please refer to the discussion on "Customer Due Diligence" and "Suspicious Activity Reporting" within this chapter for detailed guidance.

Reports of Foreign Bank Accounts

Within 31 CFR 103.24, the Treasury requires each person who has a financial interest in or signature authority, or other authority over any financial accounts, including bank, securities, or other types of financial accounts, maintained in a foreign country to report those relationships to the IRS annually if the aggregate value of the accounts exceeds

$10,000 at any point during the calendar year. The report should be filed by June 30 of the succeeding calendar year, using Form TD F 90-22.1 available on the FinCEN website. By definition, a foreign country includes all locations outside the United States, Guam, Puerto Rico, the Virgin Islands, the Northern Mariana Islands, American Samoa, and Trust Territory of the Pacific Islands. U.S. military banking facilities are excluded. Foreign assets including securities issued by foreign corporations that are held directly by a U.S. person, or through an account maintained with a U.S. office of a bank or other institution are not subject to the BSA foreign account reporting requirements. The bank is also not required to report international interbank transfer accounts ("nostro accounts") held by domestic banks. Also excluded are accounts held in a foreign financial institution in the name of, or on behalf of, a particular customer of the financial institution, or that are used solely for the transactions of a particular customer. Finally, an officer or employee of a federally-insured depository institution branch, or agency office within the U.S. of a foreign bank that is subject to the supervision of a Federal bank regulatory agency need not report that he or she has signature or other authority over a foreign bank, securities or other financial account maintained by such entities unless he or she has a personal financial interest in the account.

FinCEN Recordkeeping Requirements

Required Records for Sales of Monetary Instruments for Cash

Treasury regulation 31 CFR 103.29 prohibits financial institutions from issuing or selling monetary instruments purchased with cash in amounts of $3,000 to $10,000, inclusive, unless it obtains and records certain identifying information on the purchaser and specific transaction information. Monetary instruments include bank checks, bank drafts, cashier's checks, money orders, and traveler's checks. Furthermore, the identifying information of all purchasers must be verified. The following information must be obtained from a purchaser who has a deposit account at the financial institution:

- Purchaser's name;
- Date of purchase;
- Type(s) of instrument(s) purchased;
- Serial number(s) of each of the instrument(s) purchased; and
- Amounts in dollars of each of the instrument(s) purchased.

If the purchaser does not have a deposit account at the financial institution, the following additional information must be obtained:

- Address of the purchaser (a post office box number is not acceptable);
- Social security number (or alien identification number) of the purchaser;
- Date of birth of the purchaser; and
- Verification of the name and address with an acceptable document (i.e. driver's license).

The regulation requires that multiple purchases during one business day be aggregated and treated as one purchase. Purchases of different types of instruments at the same time are treated as one purchase and the amounts should be aggregated to determine if the total is $3,000 or more. In addition, the financial institution should have procedures in place to identify multiple purchases of monetary instruments during one business day, and to aggregate this information from all of the bank branch offices.

If a customer first deposits the cash in a bank account, then purchases a monetary instrument(s), the transaction is still subject to this regulatory requirement. The financial institution is not required to maintain a log for these transactions, but should have procedures in place to recreate the transactions.

The information required to be obtained under 31 CFR 103.29 must be retained for a period of five years.

Funds Transfer and Travel Rule Requirements

Treasury regulation 31 CFR Section 103.33 prescribes information that must be obtained for funds transfers in the amount of $3,000 or more. There is a detailed discussion of the recordkeeping requirements and risks associated with wire transfers within the "Banking Services and Activities with Greater Potential for Money Laundering and Terrorist Financing Vulnerabilities" discussion within this chapter.

Records to be Made and Retained by Financial Institutions

Treasury regulation 31 CFR 103.33 states that each financial institution must retain either the original or a microfilm or other copy/reproduction of each of the following:

- A record of each extension of credit in an amount in excess of $10,000, except an extension of credit secured by an interest in real property. The record must contain the name and address of the borrower, the loan amount, the nature or purpose of the loan, and the date the loan was made. The stated purpose can be very general such as a passbook loan, personal loan, or business loan. However, financial institutions should be encouraged to be as specific as possible when stating the loan purpose. Additionally, the purpose of a renewal, refinancing, or consolidation is not required as long as the original purpose has not changed and the original statement of purpose is retained for a period of five years after the renewal, refinancing or consolidation has been paid out.

- A record of each advice, request, or instruction received or given regarding any transaction resulting in the transfer of currency or other monetary instruments, funds, checks, investment securities, or credit, of more than $10,000 to or from any person, account, or place outside the U.S. This requirement also applies to transactions later canceled if such a record is normally made.

Required Records for Deposit Accounts

Treasury regulation 31 CFR 103.34 requires banking institutions to obtain and retain a social security number or taxpayer identification number for each deposit account opened after June 30, 1972, and before October 1, 2003. The same information must be obtained for each certificate of deposit sold or redeemed after May 31, 1978, and before October 1, 2003. The banking institution must make a reasonable effort to obtain the identification number within 30 days after opening the account, but will not be held in violation of the regulation if it maintains a list of the names, addresses, and account numbers of those customers from whom it has been unable to secure an identification number. Where a person is a nonresident alien, the banking institution shall also record the person's passport number or a description of some other government document used to verify his/her identity.

Furthermore, 31 CFR 103.34 generally requires banks to maintain records of items needed to reconstruct transaction accounts and other receipts or remittances of funds through a bank. Specific details of these requirements are in the regulation.

Record Retention Period and Nature of Records

All records required by the regulation shall be retained for five years. Records may be kept in paper or electronic form. Microfilm, microfiche or other commonly accepted forms of records are acceptable as long as they are accessible within a reasonable period of time. The record should be able to show both the front and back of each document. If no record is made in the ordinary course of business of any transaction with respect to which records are required to be retained, then such a record shall be prepared in writing by the financial institution.

CUSTOMER IDENTIFICATION PROGRAM

Section 326 of the USA PATRIOT Act, which is implemented by 31 CFR 103.121, requires banks, savings associations, credit unions, and certain non-federally regulated banks to implement a written Customer Identification Program (CIP) appropriate for its size and type of business. For Section 326, the definition of **financial institution** encompasses a variety of entities, including **banks**, agencies and branches of foreign banks in the U.S., thrifts, credit unions, private banks, trust companies, investment companies, brokers and dealers in securities, futures commission merchants, insurance companies, travel agents, pawnbrokers, dealers in precious metals, check cashers, casinos, and telegraph companies, among many others identified at 31 USC 5312(a)(2) and (c)(1)(A). As of October 1, 2003, all institutions and their operating subsidiaries must have in place a CIP pursuant to Treasury regulation 31 CFR 103.121.

The CIP rules do not apply to a **financial institution**'s foreign subsidiaries. However, **financial institutions** are encouraged to implement an effective CIP throughout their operations, including their foreign offices, except to the extent that the requirements of the rule would conflict with local law.

Applicability of CIP Regulation

The CIP rules apply to **banks**, as defined in 31 CFR 103.11 that are subject to regulation by a Federal Banking Agency and to any non-Federally-insured credit union, private bank or trust company that does not have a Federal functional regulator. Entities that are regulated by the U.S. Securities and Exchange Commission (SEC) and the Commodity Futures Trading Commission (CFTC) are subject to separate rulemakings. It is intended that the effect of all of these rules be uniform throughout the financial services industry.

CIP Requirements

31 CFR 103.121 requires a **bank** to develop and implement a written, board-approved CIP, appropriate for its size and type of business that includes, at a minimum, procedures for:

- Verifying a customer's true identity to the extent reasonable and practicable and defining the methodologies to be used in the verification process;
- Collecting specific identifying information from each customer when opening an account;
- Responding to circumstances and defining actions to be taken when a customer's true identity cannot be appropriately verified with "reasonable belief;"
- Maintaining appropriate records during the collection and verification of a customer's identity;
- Verifying a customer's name against specified terrorist lists; and
- Providing customers with adequate notice that the **bank** is requesting identification to verify their identities.

While not required, a **bank** may also include procedures for:

- Specifying when it will rely on another **financial institution** (including an affiliate) to perform some or all of the elements of the CIP.

Additionally, 31 CFR 103.121 provides that a **bank** with a Federal functional regulator must formally incorporate its CIP into its written board-approved anti-money laundering program. The FDIC expanded Section 326.8 of its Rules and Regulations to require each **FDIC-supervised institution** to implement a CIP that complies with 31 CFR 103.121 and incorporate such CIP into a bank's written board-approved BSA compliance program (with evidence of such approval noted in the board meeting minutes). Consequently, a **bank** must specifically provide:

- Internal policies, procedures, and controls;
- Designation of a compliance officer;
- Ongoing employee training programs; and
- An independent audit function to test program.

The slight difference in wording between the Treasury's and FDIC's regulations regarding incorporation of a bank's CIP within its anti-money laundering program and BSA compliance program, respectively, was not intended to create duplicative requirements. Therefore, an FDIC-regulated **bank** must include its CIP within its anti-money laundering program and the latter included under the "umbrella" of its overall BSA/AML program.

CIP Definitions

As discussed above, both Section 326 of the USA PATRIOT Act and 31 CFR 103.121 specifically define the terms **financial institution** and **bank**. Similarly, specific definitions are provided for the terms **person**, **customer**, and **account**. Both bank management and examiners must properly understand these terms in order to effectively implement and assess compliance with CIP regulations, respectively.

Person

A **person** is generally an individual or other legal entity (such as registered corporations, partnerships, and trusts).

Customer

A **customer** is generally defined as any of the following:

- A **person** that opens a new **account** (**account** is defined further within the discussion of CIP definitions);
- An individual acting with "power of attorney"(POA)[3] who opens a new **account** to be owned by or for the benefit of a **person** lacking legal capacity, such as a minor;
- An individual who opens an **account** for an entity that is not a legal person, such as a civic club or sports boosters;
- An individual added to an existing **account** or one who assumes an existing debt at the **bank;** or
- A deposit broker who brings new customers to the bank (as discussed in detail later within this section).

The definition of **customer** excludes:

- A financial institution regulated by a Federal Banking Agency or a bank regulated by a State bank regulator[4];
- A department or agency of the U.S. Government, of any state, or of any political subdivision of any state;
- Any entity established under the laws of the U.S., of any state, or of any political subdivision of any state, or under an interstate compact between two or more states, that exercises governmental authority on behalf of the U.S. or any such state or political subdivision (U.S. includes District of Columbia and Indian tribal lands and governments); or

[3] If a POA individual opens an account for another individual with legal capacity or for a legal entity, then the **customer** is still the account holder. In this case, the POA is an agent acting on behalf of the **person** that opens the account and the CIP must still cover the account holder (unless the person lacks legal capacity).

[4] The IRS is not a Federal functional regulator. Consequently, money service businesses, such as check cashers and wire transmitters that are regulated by the IRS are not exempted from the definition of customer for CIP purposes.

- Any entity, other than a bank, whose common stock or analogous equity interests are listed on the New York or American Stock Exchanges or whose common stock or analogous equity interests have been designated as a NASDAQ National Market Security listed on the NASDAQ Stock Market (except stock or interests listed under the separate "NASDAQ Small-Cap Issues" heading). A listed company is exempted from the definition of **customer** only for its domestic operations.

The definition of **customer** also excludes a **person** who has an existing account with a bank, provided that the bank has a "reasonable belief" that it knows the true identity of the **person**. So, if the **person** were to open an additional account, or renew or roll over an existing account, CIP procedures would <u>not</u> be required. A bank can demonstrate that is has a "reasonable belief" that it knows the identity of an existing customer by:

- Demonstrating that it had similar procedures in place to verify the identity of **persons** prior to the effective date of the CIP rule. (An "affidavit of identity" by a bank officer is not acceptable for demonstrating "reasonable belief.")
- Providing a history of **account** statements sent to the **person.**
- **Maintaining account** information sent to the IRS regarding the **person's accounts** accompanied by IRS replies that contain no negative comments.
- Providing evidence of loans made and repaid, or other services performed for the **person** over a period of time.

These actions may <u>not</u> be sufficient for existing account holders deemed to be high risk. For example, in the situation of an import/export business where the identifying information on file only includes a number from a passport marked as a duplicate with no additional business information on file, the bank should follow all of the CIP requirements provided in 31 CFR 103.121 since it does not have sufficient information to show a "reasonable belief" of the true identity of the existing account holder.

<u>Account</u>

An **account** is defined as a formal, ongoing banking relationship established to provide or engage in services, dealings, or other financial transactions including:

- Deposit accounts;
- Transaction or asset accounts ;
- Credit accounts, or any other extension of credit;
- Safety deposit box or other safekeeping services;
- Cash management, custodian, and trust services; or
- Any other type of formal, ongoing banking relationship.

The definition of **account** specifically excludes the following:

- Product or service where a formal banking relationship is NOT established with a **person**. Thus CIP is not intended for infrequent transactions and activities (already covered under other recordkeeping requirements within 31 CFR 103) such as:
  - Check cashing,
  - Wire transfers,
  - Sales of checks,
  - Sales of money orders;
- Accounts acquired through an acquisition, merger, purchase of assets, or assumption of liabilities (as these "new" accounts were not initiated by customers);[5] and
- Accounts opened for the purpose of participating in an employee benefit plan established under the Employee Retirement Income Security Act of 1974 (ERISA).

Furthermore, the CIP requirements do not apply to a **person** who does not receive banking services, such as a **person** who applies for a loan but has his/her application denied. The **account** in this circumstance is only opened when the bank enters into an enforceable agreement to provide a loan to the **person** (who therefore also simultaneously becomes a **customer**).

Collecting Required Customer Identifying Information

The CIP must contain account opening procedures that specify the identifying information obtained from each customer <u>prior</u> to opening the account. The minimum required information includes:

- Name.
- Date of birth, for an individual.

[5] Accounts acquired by purchase of assets from a third party are excluded from the CIP regulations, provided the purchase was not made under an agency in place or exclusive sale arrangement, where the bank has final approval of the credit. If under an agency arrangement, the bank may rely on the agent third party to perform the bank's CIP, but it must ensure that the agent is performing the bank's CIP program. For example, a pool of auto loans purchased from an auto dealer after the loans have already been made would not be subject to the CIP regulations. However, if the bank is directly extending credit to the borrower and is using the car dealer as its agent to gather information, then the bank must ensure that the dealer is performing the bank's CIP.

- Physical address[6], which shall be:
    - for an individual, a residential or business street address (An individual who does not have a physical address may provide an Army Post Office [APO] or a Fleet Post Office [FPO] box number, or the residential or business street address of next of kin or of another contact individual. Using the box number on a rural route is acceptable description of the physical location requirement.)
    - for a person other than an individual (such as corporations, partnerships, and trusts), a principal place of business, local office, or other physical location.
- Identification number including a SSN, TIN, Individual Tax Identification Number (ITIN), or Employer Identification Number (EIN).

For non-U.S. persons, the bank must obtain one or more of the following identification numbers:

- Customer's TIN,
- Passport number and country of issuance,
- Alien identification card number, and
- Number and country of issuance of any other (foreign) government-issued document evidencing nationality or residence and bearing a photograph or similar safeguard.

When opening an account for a foreign business or enterprise that does not have an identification number, the bank must request alternative government-issued documentation certifying the existence of the business or enterprise.

Exceptions to Required Customer Identifying Information

The bank may develop, include, and follow CIP procedures for a customer who at the time of account opening, has applied for, but has not yet received, a TIN. However, the CIP must include procedures to confirm that the application was filed before the customer opens the account and procedures to obtain the TIN within a reasonable period of time after the account is opened.

There is also an exception to the requirement that a bank obtain the above-listed identifying information <u>from the customer</u> prior to opening an account in the case of credit card accounts. A bank may obtain identifying information (such as TIN) <u>from a third-party source</u> prior to extending credit to the customer.

Verifying Customer Identity Information

The CIP should rely on a **risk-focused** approach when developing procedures for verifying the identity of each customer to the extent reasonable and practicable. A bank need not establish the accuracy of every element of identifying information obtained in the account opening process, but must do so for enough information to form a "reasonable belief" that it knows the true identity of each customer. At a minimum, the **risk-focused** procedures must be based on, but not limited to, the following factors:

- Risks presented by the various types of accounts offered by the bank;
- Various methods of opening accounts provided by the bank;
- Various sources and types of identifying information available; and
- The bank's size, location, and customer base.

Furthermore, a bank's CIP procedures must describe when the bank will use **documentary verification methods**, **non-documentary verification methods**, or a **combination of both methods**.

<u>Documentary Verification</u>

The CIP must contain procedures that set forth the specific documents that the bank will use. For an individual, the documents may include:

- Unexpired government-issued identification evidencing nationality or residence, and bearing a photograph or similar safeguard, such as a driver's license or passport.

For a person other than an individual (such as a corporation, partnership, or trust), the documents may include:

- Documents showing the existence of the entity, such as certified articles of incorporation, a government-issued business license, a partnership agreement, trust instrument, a certificate of good standing, or a business resolution.

<u>Non-Documentary Verification</u>

[6] The bank MUST obtain a physical address: a P.O. Box alone is NOT acceptable. Collection of a P.O. Box address and/or alternate mailing address is optional and potentially very useful as part of the bank's Customer Due Diligence (CDD) program.

Banks are not required to use non-documentary methods to verify a customer's identity. However, if a bank chooses to do so, a description of the approved non-documentary methods must be incorporated in the CIP. Such methods may include:

- Contacting the customer,
- Checking references with other financial institution,
- Obtaining a financial statement, and
- Independently verifying the customer's identity through the comparison of information provided by the customer with information obtained from consumer reporting agencies (for example, Experian, Equifax, TransUnion, Chexsystems), public databases (for example, Lexis, Dunn and Bradstreet), or other sources (for example, utility bills, phone books, voter registration bills).

The bank's non-documentary procedures must address situations such as:

- The inability of a customer to present an unexpired government-issued identification document that bears a photograph or similar safeguard;
- Unfamiliarity on the bank's part with the documents presented;
- Accounts opened without obtaining documents;
- Accounts opened without the customer appearing in person at the bank (for example, accounts opened through the mail or over the Internet); and
- Circumstances increasing the risk that the bank will be unable to verify the true identity of a customer through documents.

Many of the risks presented by these situations can be mitigated. A bank that accepts items that are considered secondary forms of identification, such as utility bills and college ID cards, is encouraged to review more than a single document to ensure that it has formed a "reasonable belief" of the customer's true identity. Furthermore, in instances when an account is opened over the Internet, a bank may be able to obtain an electronic credential, such as a digital certificate, as one of the methods it uses to verify a customer's identity.

Additional Verification Procedures for Customers (Non-Individuals)

The CIP must address situations where, based on a risk assessment of a new account that is opened by a customer that is not an individual, the bank will obtain information about individuals with authority or control over such accounts, in order to verify the customer's identity. These individuals could include such parties as signatories, beneficiaries, principals, and guarantors. As previously stated, a risk-focused approach should be applied to verify customer accounts. For example, in the case of a well-known firm, company information and verification could be sufficient without obtaining and verifying identity information for all signatories. However, in the case of a relatively new or unknown firm, it would be in the bank's best interest to obtain and verify a greater volume of information on signatories and other individuals with control or authority over the firm's account.

Inability to Verify Customer Identity Information

The CIP must include procedures for responding to circumstances in which the bank cannot form a reasonable belief that it knows the true identity of a customer. These procedures should describe, at a minimum, the following:

- Circumstances when the bank should not open an account;
- The terms or limits under which a customer may use an account while the bank attempts to verify the customer's identity (for example, minimal or no funding on credit cards, holds on deposits, limits on wire transfers);
- Situations when an account should be closed after attempts to verify a customer's identity have failed; and
- Conditions for filing a SAR in accordance with applicable laws and regulations.

Recordkeeping Requirements

The bank's CIP must include recordkeeping procedures for:

- Any document that was relied upon to verify identity noting the type of document, the identification number, the place of issuance, and, if any, the dates of issuance and expiration;
- The method and results of any measures undertaken to perform non-documentary verification procedures; and
- The results of any substantive discrepancy discovered when verifying the identifying information obtained.

Banks are not required to make and retain photocopies of any documents used in the verification process. However, if a bank does choose to do so, it must ensure that these photocopies are physically secured to adequately protect against possible identity theft. In addition, such photocopies should not be maintained with files and documentation relating to credit decisions in order to avoid any potential problems with consumer compliance regulations.

Required Retention Period

All required customer identifying information obtained in the account opening process must be retained for five years after the account is closed, or in the case of credit card accounts, five years after the account is closed or becomes dormant. The other "required records" (descriptions of documentary and non-documentary verification procedures and any descriptions of substantive discrepancy resolution) must be retained for five years after the record is made. If several accounts are opened at a bank for a customer simultaneously, all of the required customer identifying information obtained in the account opening process must be retained for five years after the last account is closed, or in the case of credit card accounts, five years after the last account is closed or becomes dormant. As in the case of a single account, all other "required records" must be kept for five years after the records are made.

Comparison with Government Lists of Known or Suspected Terrorists

The CIP must include procedures for determining whether the customer appears on any list of known or suspected terrorists or terrorist organizations issued by any Federal government agency and designated as such by the Treasury in consultation with the other Federal functional regulators.

The comparison procedures must be performed and a determination made within a reasonable period of time after the account is opened, or earlier, as required and directed by the issuing agency. Since the USA PATRIOT Act Section 314(a) Requests, discussed in detail under the heading entitled "Special Information Sharing Procedures to Deter Money Laundering and Terrorist Activities," are one-time only searches, they are not applicable to the CIP.

Adequate Customer Notice

The CIP must include procedures for providing customers with adequate notice that the bank is requesting information to verify their identities. This notice must indicate that the institution is collecting, verifying, and recording the customer identity information as outlined in the CIP regulations. Furthermore, the customer notice must be provided prior to account opening, with the general belief that it will be clearly read and understood. This notice may be posted on a lobby sign, included on the bank's website, provided orally, or disclosed in writing (for example, account application or separate disclosure form). The regulation provides sample language that may be used for providing adequate customer notice. In the case of joint accounts, the notice must be provided to all joint owners; however, this may be accomplished by providing notice to one owner for delivery to the other owners.

Reliance on Another Financial Institution's CIP

A bank may develop and implement procedures for relying on another financial institution for the performance of CIP procedures, yet the CIPs at both entities do not have to be identical. The reliance can be used with respect to any bank customer that is opening or has opened an account or similar formal relationship with the relied-upon financial institution. Additionally, the following requirements must be met:

- Reliance is reasonable, under the circumstances;
- The relied-upon financial institution (including an affiliate) is subject to the same anti-money laundering program requirements as a bank, and is regulated by a Federal functional regulator (as previously defined); and
- A signed contract exists between the two entities that requires the relied-upon financial institution to certify annually that it has implemented its anti-money laundering program, and that it will perform (or its agent will perform) the specified requirements of the bank's CIP.

To strengthen such an arrangement, the signed contract should include a provision permitting the bank to have access to the relied-upon institution's annual independent review of its CIP.

Deposit Broker Activity

The use of deposit brokers is a common funding mechanism for many financial institutions. This activity is considered higher risk because each deposit broker operates under its own operating guidelines to bring customers to a bank. Consequently, the deposit broker may not be performing sufficient Customer Due Diligence (CDD), Office of Foreign Assets Control (OFAC) screening (refer to the detailed OFAC discussion provided elsewhere within this chapter), or CIP procedures. The bank accepting brokered deposits relies upon the deposit broker to have sufficiently performed all required account opening procedures and to have followed all BSA and AML program requirements.

Deposit Broker is Customer

Regulations contained in 31 CFR 103.121 specifically defines the term customer as a person (individual, registered corporation, partnership, or trust). Therefore, according to this definition, if a deposit broker opens an account(s), the customer is the deposit broker NOT the deposit broker's clients.

Deposit Broker's CIP

Deposit brokers must follow their own CIP requirements for their customers. If the deposit broker is registered with the SEC, then it is required to follow the same general CIP requirements as banking institutions and is periodically examined by the SEC for compliance. However, if the deposit broker does not come under the SEC's jurisdiction, they may not be following any due diligence laws or guidelines.

As such, banks accepting deposit broker accounts should establish policies and procedures regarding the brokered deposits. Policies should establish minimum due diligence procedures for all deposit brokers providing business to the bank. The level of due diligence a bank performs should be commensurate with its knowledge of the deposit broker and the broker's known business practices.

Banks should conduct **enhanced** due diligence on unknown and/or unregulated deposit brokers. For protection, the bank should determine that the:

- Deposit broker is legitimate;
- Deposit broker is following appropriate guidance and/or regulations;
- Deposit broker's policies and procedures are sufficient;
- Deposit broker has adequate CIP verification procedures;
- Deposit broker screens clients for OFAC matches;
- BSA/OFAC audit reviews are adequate and show compliance with requirements; and
- Bank management is aware of the deposit broker's anticipated volume and transaction type.

Special care should be taken with deposit brokers who:

- Are previously unknown to the bank;
- Conduct business or obtain deposits primarily in another country;
- Use unknown or hard-to-contact businesses and banks for references;
- Provide other services which may be suspect, such as creating shell corporations for foreign clients;
- Advertise their own deposit rates, which vary widely from those offered by banking institutions; and
- Refuse to provide requested due diligence information or use methods to get deposits placed before providing information.

Banks doing business with deposit brokers are encouraged to include contractual requirements for the deposit broker to establish and conduct procedures for minimum CIP, CDD, and OFAC screening.

Finally, the bank should monitor brokered deposit activity for unusual activity, including cash transactions, structuring, and funds transfer activity. Monitoring procedures should identify any "red flags" suggesting that the deposit broker's customers (the ultimate customers) are trying to conceal their true identities and/or their source of wealth and funds.

Additional Guidance on CIP Regulations

Comprehensive guidance regarding CIP regulations and related examination procedures can be found within FDIC FIL 90-2004, Guidance on Customer Identification Programs. On January 9, 2004, the Treasury, FinCEN, and the Federal Financial Institutions Examination Council (FFIEC) regulatory agencies issued joint interpretive guidance addressing frequently asked questions (FAQs) relating to CIP requirements in FIL-4-2004. Additional information regarding CIP can be found on the FinCEN website.

SPECIAL INFORMATION SHARING PROCEDURES TO DETER MONEY LAUNDERING AND TERRORIST ACTIVITIES

Section 314 of the USA PATRIOT Act covers special information sharing procedures to deter money laundering and terrorist activities. These are the only two categories that apply under Section 314 information sharing; no information concerning other suspicious or criminal activities can be shared under the provisions of Section 314 of the USA PATRIOT Act. Final regulations of the following two rules issued on March 4, 2002, became effective on September 26, 2002:

- Section 314(a), codified into 31 CFR 103.100, requires **mandatory** information sharing between the U.S. Government (FinCEN, Federal law enforcement agencies, and Federal Banking Agencies) and financial institutions.
- Section 314(b), codified into 31 CFR 103.110, encourages **voluntary** information sharing between financial institutions and/or associations of financial institutions.

Section 314(a) – Mandatory Information Sharing Between the U.S. Government and Financial Institutions

A Federal law enforcement agency investigating terrorist activity or money laundering may request that FinCEN solicit, on its behalf, certain information from a financial institution or a group of financial institutions on certain individuals or entities. The law enforcement agency must provide a written certification to FinCEN attesting that credible evidence of money laundering or terrorist activity exists. It must also provide specific identifiers such as date of birth, address, and social security number of the individual(s) under investigation that would permit a financial institution to differentiate among customers with common or similar names.

Section 314(a) Requests

Upon receiving an adequate written certification from a law enforcement agency, FinCEN may require financial institutions to perform a search of their records to determine whether they maintain or have maintained accounts for, or have engaged in transactions with, any specified individual, entity, or organization. This process involves providing a Section 314(a) Request to the financial institutions. Such lists are issued to financial institutions every two weeks by FinCEN.

Each Section 314(a) request has a unique tracking number. The general instructions for a Section 314(a) Request require financial institutions to complete a **one-time** search of their records and respond to FinCEN, if necessary, within **two weeks**. However, individual requests can have different deadline dates. Any specific guidelines on the request supercede the general guidelines.

Designated Point-of-Contact for Section 314(a) Requests

All financial institutions shall designate at least one point-of-contact for Section 314(a) requests and similar information requests from FinCEN. FDIC-supervised financial institutions must promptly notify the FDIC of any changes to the point-of-contact, which is reported on each Call Report.

Financial Institution Records Required to be Searched

The records that must be searched for a Section 314(a) Request are specified in the request itself. Using the identifying information contained in the 314(a) request, financial institutions are required to conduct a **one-time** search of the following records, **whether or not they are kept electronically (subject to the limitations below)**:

- Deposit account records;
- Funds transfer records;
- Sales of monetary instruments (purchaser only);
- Loan records;
- Trust department records;
- Securities records (purchases, sales, safekeeping, etc.);
- Commodities, options, and derivatives; and
- Safe deposit box records (but only if searchable electronically).

According to the general instructions to Section 314(a), financial institutions are NOT required to research the following documents for matches:

- Checks processed through an account for a payee,
- Monetary instruments for a payee,
- Signature cards, and
- CTRs and SARs previously filed.

The general guidelines specify that the record search need only encompass current accounts and accounts maintained by a named subject during the preceding twelve (12) months, and transactions not linked to an account conducted by a named subject during the preceding six (6) months. Any record described above that is not maintained in electronic form need only be searched if it is required to be kept under federal law or regulation.

Again, if the specific guidelines or the timeframe of records to be searched on a Section 314(a) Request differ from the general guidelines, they should be followed to the extent possible. For example, if a particular Section 314(a) Request asks financial institutions to search their records back eight years, the financial institutions should honor such requests to the extent possible, even though BSA recordkeeping requirements generally do not require records to be retained beyond five years.

Reporting of "Matches"

Financial institutions typically have a two-week window to complete the one-time search and respond, if necessary to FinCEN. If a financial institution identifies an account or transaction by or on behalf of an individual appearing on a Section 314(a) Request, it must report back to FinCEN that it has a "positive match," unless directed otherwise. When reporting this information to FinCEN, no additional details, unless otherwise instructed, should be provided other than the fact that a "positive match" has been identified. In situations where a financial institution is unsure of a match, it may contact the law enforcement agency specified in the Section 314(a) Request. Negative responses to Section 314(a) Requests are not required; the financial institution does not need to respond to FinCEN on a Section 314(a) Request if there are no matches to the institution's records. Financial institutions are to be reminded that unless a name is repeated on a subsequent Section 314(a) Request, that name does not need to be searched again.

The financial institution **must not** notify a customer that he/she has been included on a Section 314(a) Request. Furthermore, the financial institution must not tell the customer that he/she is under investigation or that he/she is suspected of criminal activity.

Restrictions on Use of Section 314(a) Requests

A financial institution may only use the information identified in the records search to report "positive matches" to FinCEN and to file, when appropriate, SARs. If the financial institution has a "positive match," account activity with that customer or entity is not prohibited; it is acceptable for the financial institution to open new accounts or maintain current accounts with Section 314(a) Request subjects; the closing of accounts is not required. However, the Section 314(a) Requests may be useful as a determining factor for such decisions if the financial institution so chooses. Unlike OFAC lists, Section 314(a) Requests are not permanent "watch lists." In fact, Section 314(a) Requests are not updated or corrected if an investigation is dropped, a prosecution is declined, or a subject is exonerated, as they are point-in-time inquiries. Furthermore, the names provided on Section 314(a) Requests do not necessarily correspond to convicted or indicted persons; rather, a Section 314(a) Request subject need only be "reasonably suspected," based on credible evidence of engaging in terrorist acts or money laundering to appear on the list.

SAR Filings

If a financial institution has a positive match within its records, it is not required to automatically file a SAR on the identified subject. In other words, the subject's presence on the Section 314(a) Request should not be the sole factor in determining whether to file a SAR. However, prudent BSA compliance practices should ensure that the subject's accounts and transactions be scrutinized for suspicious or unusual activity. If, after such a review is performed, the financial institution's management has determined that the subject's activity is suspicious, unusual, or inconsistent with the customer's profile, then the timely filing of an SAR would be warranted.

Confidentiality of Section 314(a) Requests

Financial institutions must protect the security of the Section 314(a) Requests, as they are confidential. As stated previously, a financial institution must not tip off a customer that he/she is the subject of a Section 314(a) Request. Similarly, a financial institution cannot disclose to any person or entity, other than to FinCEN, its primary Federal functional regulator, or the Federal law enforcement agency on whose behalf FinCEN is requesting information, the fact that FinCEN has requested or obtained information from a Section 314(a) Request.

FinCEN has stated that an affiliated group of financial institutions may establish one point-of-contact to distribute the Section 314(a) Requests for the purpose of responding to requests. However, the Section 314(a) Requests should not be shared with foreign affiliates or foreign subsidiaries (unless the request specifically states otherwise), and the lists cannot be shared with affiliates or subsidiaries of bank holding companies that are not financial institutions.

Notwithstanding the above restrictions, a financial institution is authorized to share information concerning an individual, entity, or organization named in a Section 314(a) Request from FinCEN with other financial institutions and/or financial institution associations in accordance with the certification and procedural requirements of Section 314(b) of the USA PATRIOT Act discussed below. However, such sharing shall not disclose the fact that FinCEN has requested information on the subjects or the fact that they were included within a Section 314(a) Request.

Internal Financial Institution Measures for Protecting Section 314(a) Requests

In order to protect the confidentiality of the Section 314(a) Requests, these documents should only be provided to financial institution personnel who need the information to conduct the search and should not be left in an unprotected or unsecured area. A financial institution may provide the Section 314(a) Request to third-party information technology service providers or vendors to perform/facilitate the record searches so long as it takes the necessary steps to ensure that the third party appropriately safeguards the information. It is important to remember that the financial institution remains ultimately responsible for the performance of the required searches and to protect the security and confidentiality of the Section 314(a) Requests.

Each financial institution must maintain adequate procedures to protect the security and confidentiality of requests from FinCEN. The procedures to ensure confidentiality will be considered adequate if the financial institution applies procedures similar to those it has established to comply with Section 501 of the Gramm-Leach-Bliley Act (15 USC 6801) with regard to the protection of its customers' non-public personal information.

Financial institutions should keep a log of all Section 314(a) Requests received and any "positive matches" identified and reported to FinCEN. Additionally, documentation that all required searches were performed is essential. The financial institution should not need to keep copies of the Section 314(a) Requests, noting the unique tracking number will suffice. Some financial institutions may choose to destroy the Section 314(a) Requests after searches are performed. If a financial institution chooses to keep the Section 314(a) Requests for audit/internal review purposes, it should not be criticized for doing so, as long as it appropriately secures them and protects their confidentiality.

FinCEN has provided financial institutions with general instructions, FAQs, and additional guidance relating to the Section 314(a) Request process. These documents are revised periodically and may be found on FinCEN's Web site.

Section 314(b) - Voluntary Information Sharing

Section 314(b) of the USA PATRIOT Act encourages financial institutions and financial institution associations (for example, bank trade groups and associations) to share information on individuals, entities, organizations, and countries suspected of engaging in possible terrorist activity or money laundering. Section 314(b) limits the definition of "financial institutions" used within Section 314(a) of USA PATRIOT Act to include only those institutions that are required to establish and maintain an anti-money laundering program; this definition includes, but is not limited to, banking entities regulated by the Federal Banking Agencies. The definition specifically excludes any institution or class of institutions that FinCEN has designated as ineligible to share information. Section 314(b) also describes the safe harbor from civil liability that is provided to financial institutions that appropriately share information within the limitations and requirements specified in the regulation.

Restrictions on Use of Shared Information

Information shared on a subject from a financial institution or financial institution association pursuant to Section 314(b) cannot be used for any purpose other than the following:

- Identifying and, where appropriate, reporting on money laundering or terrorist activities;
- Determining whether to establish or maintain an account, or to engage in a transaction; or
- Assisting in the purposes of complying with this section.

Annual Certification Requirements

In order to avail itself to the statutory safe harbor protection, a financial institution or financial institution association must annually certify with FinCEN stating its intent to engage in information sharing with other similarly-certified entities. It must further state that it has established and will maintain adequate procedures to protect the security and confidentiality of the information, as if the information were included in one of its own SAR filings. The annual certification process involves completing and submitting a "Notice for Purposes of Subsection 314(b) of the USA PATRIOT Act and 31 CFR 103.110." The notice can be completed and electronically submitted to FinCEN via their website. Alternatively, the notice can be mailed to the following address: FinCEN, P.O. Box 39, Mail Stop 100, Vienna, VA 22183. It is important to mention that if a financial institution or financial institution association improperly uses its Section 314(b) permissions, its certification can be revoked by either FinCEN or by its Federal Banking Agency.

Failure to follow the Section 314(b) annual certification requirements will result in the loss of the financial institution or financial institution association's statutory safe harbor and could result in a violation of privacy laws or other laws and regulations.

Verification Requirements

A financial institution must take reasonable steps to verify that the other financial institution(s) or financial institution association(s) with which it intends to share information has also performed the annual certification process discussed above. Such verification can be performed by reviewing the lists of other 314(b) participants that are periodically provided by FinCEN. Alternatively, the financial institution or financial institution association can confirm directly with the other party that the certification process has been completed.

Other Important Requirements and Restrictions

Section 314(b) requires virtually the same care and safeguarding of sensitive information as Section 314(a), whether the bank is the "provider" or "receiver" of information. Refer to the discussions provided above and within "Section 314(a) – Mandatory Information Sharing Between the U.S. Government and Financial Institutions" for detailed guidance on:

- SAR Filings and
- Confidentiality of Section 314(a) Requests (including the embedded discussion entitled "Internal Financial Institution Measures for Protecting Section 314(a) Requests").

Actions taken pursuant to shared information do not affect a financial institution's obligations to comply with all BSA and OFAC rules and regulations. For example, a financial institution is still obligated to immediately contact law enforcement and its Federal regulatory agency, by telephone, when a significant reportable violation requiring immediate attention (such as one that involves the financing of terrorist activity or is of an ongoing nature) is being conducted; thereafter, a timely SAR filing is still required.

FinCEN has provided financial institutions with general instructions, registration forms, FAQs, and additional guidance relating to the Section 314(b) information sharing process. These documents are revised periodically and may be found on FinCEN's website.

CUSTOMER DUE DILIGENCE (CDD)

The cornerstone of strong BSA/AML programs is the adoption and implementation of comprehensive CDD policies, procedures, and controls for all customers, particularly those that present a higher risk for money laundering and terrorist financing. The concept of CDD incorporates and builds upon the CIP regulatory requirements for identifying and verifying a customer's identity.

The goal of a CDD program is to develop and maintain an awareness of the unique financial details of the institution's customers and the ability to relatively predict the type and frequency of transactions in which its customers are likely to engage. In doing so, institutions can better identify, research, and report suspicious activity as required by BSA regulations. Although not required by statute or regulation, an effective CDD program provides the critical framework that enables the institution to comply with regulatory requirements.

Benefits of an Effective CDD Program

An effective CDD program protects the reputation of the institution by:

- Preventing unusual or suspicious transactions in a timely manner that potentially exposes the institution to financial loss or increased expenses;
- Avoiding criminal exposure from individuals who use the institution's resources and services for illicit purposes; and
- Ensuring compliance with BSA regulations and adhering to sound and recognized banking practices.

CDD Program Guidance

CDD programs should be tailored to each institution's BSA/AML risk profile; consequently, the scope of CDD programs will vary. While smaller institutions may have more frequent and direct contact with customers than their counterparts in larger institutions, all institutions should adopt and follow an appropriate CDD program.

An effective CDD program should:

- Be commensurate with the institution's BSA/AML risk profile, paying particular attention to higher risk customers,
- Contain a clear statement of management's overall expectations and establish specific staff responsibilities, and
- Establish monitoring systems and procedures for identifying transactions or activities inconsistent with a customer's normal or expected banking activity.

Customer Risk

As part of an institution's BSA/AML risk assessment, many institutions evaluate and apply a BSA/AML risk rating to its customers. Under this approach, the institution will obtain information at account opening sufficient to develop a "customer transaction profile" that incorporates an understanding of normal and expected activity for the customer's occupation or business operations. While this practice may not be appropriate for all institutions, management of all institutions should have a thorough understanding of the money laundering or terrorist financing risks of its customer base and develop and implement the means to adequately mitigate these risks.

Due Diligence for Higher Risk Customers

Customers that pose higher money laundering or terrorist financing risks present increased exposure to institutions. Due diligence for higher risk customers is especially critical in understanding their anticipated transactions and implementing a suspicious activity monitoring system that reduces the institution's reputation, compliance, and transaction risks. Higher risk customers and their transactions should be reviewed more closely at account opening and more frequently throughout the term of the relationship with the institution.

The USA PATRIOT Act requires special due diligence at account opening for certain foreign accounts, such as foreign correspondent accounts and accounts for senior foreign political figures. An institution's CDD program should include policies, procedures, and controls reasonably designed to detect and report money laundering through correspondent accounts and private banking accounts that are established or maintained for non-U.S. persons. Guidance regarding special due diligence requirements is provided in the next section entitled "Banking Services and Activities with Greater Potential for Money Laundering and Enhanced Due Diligence Procedures."

BANKING SERVICES AND ACTIVITIES WITH GREATER POTENTIAL FOR MONEY LAUNDERING AND ENHANCED DUE DILIGENCE PROCEDURES

Certain financial services and activities are more vulnerable to being exploited in money laundering and terrorist financing activities. These conduits are often utilized because each typically presents an opportunity to move large amounts of funds embedded within a large number of similar transactions. Most activities discussed in this section also offer access to international banking and financial systems. The ability of U.S. financial institutions to conduct the appropriate level of due diligence on customers of foreign banks, offshore and shell banks, and foreign branches is often severely limited by the laws and banking practices of other countries.

While international AML and Counter-Terrorist Financing (CTF) standards are improving through efforts of several international groups, U.S. financial institutions will still need effective systems in their AML and CTF programs to understand the quality of supervision and assess the integrity and effectiveness of controls in other countries. Higher risk areas discussed in this section include:

- Non-bank financial institutions (NBFIs), including money service businesses (MSBs);
- Foreign correspondent banking relationships;
- Payable-through accounts;
- Private banking activities;
- Numbered accounts;
- Pouch activities;
- Special use accounts;
- Wire transfer activities; and
- Electronic banking.

Financial institutions offering these higher risk products and services must enhance their AML and CDD procedures to ensure adequate scrutiny of these activities and the customers conducting them.

Non-Bank Financial Institutions and Money Service Businesses

Non-bank financial institutions (NBFIs) are broadly defined as institutions that offer financial services. Traditional financial institutions ("banks" for this discussion) that maintain account relationships with NBFIs are exposed to a higher risk for potential money laundering activities because these entities are less regulated and may have limited or no documentation on their customers. Additionally, banks may likewise be exposed to possible OFAC violations for unknowingly engaging in or facilitating prohibited transactions through a NBFI account relationship.

NBFIs include, but are not limited to:

- Casinos or card clubs;
- Securities brokers/dealers; and
- Money Service Businesses (MSBs)
  - currency dealers or exchangers;
  - check cashers;
  - issuers, sellers, or redeemers of traveler's checks, money orders, or stored value cards;
  - money transmitters; and
  - U.S. Post Offices (money orders).

Money Service Businesses

As indicated above, MSBs are a subset of NBFIs. Regulations for MSBs are included within 31 CFR 103.41. All MSBs were required to register with FinCEN using Form TD F 90-22.55 by December 31, 2001, or within 180 days after the business begins operations. Thereafter, each MSB must renew its registration every two years.

MSBs are a major industry, and typically operate as independent businesses. Relatively few MSBs are chains that operate in multiple states. MSBs can be sole-purpose entities but are frequently tied to another business such as a liquor store, bar, grocery store, gas station, or other multi-purpose entity. As a result, many MSBs are frequently unaware of their legal and regulatory requirements and have been historically difficult to detect. A bank may find it necessary to inform MSB customers about the appropriate MSB regulations and requirements.

Most legitimate MSBs should not refuse to follow regulations once they have been informed of the requirements. If they do, the bank should closely scrutinize the MSBs activities and transactions for possible suspicious activity.

MSBs typically do not establish on-going customer relationships, and this is one of the reasons that MSB customers are considered higher risk. Since MSBs do not have continuous relationships with their clients, they generally do not obtain key due diligence documentation, making customer identification and suspicious transaction identification more difficult.

Banks with MSB customers also have a risk in processing third-party transactions through their payment and other banking systems. MSB transactions carry an inherent potential for the facilitation of layering. MSBs can be conduits for illicit cash and monetary instrument transactions, check kiting, concealing the ultimate beneficiary of the funds, and facilitating the processing of forged or fraudulent items such as treasury checks, money orders, traveler's checks, and personal checks.

MSB Agents

MSBs that are agents of such commonly known entities as Moneygram or Western Union should be aware of their legal requirements. Agents of such money transmitters, unless they offer another type of MSB activity, do NOT have to independently register with FinCEN, but are maintained on an agency list by the "actual" MSB (such as Western Union). However, this "actual" MSB is responsible for providing general training and information requirements to their agents and for aggregating transactions on a nationwide basis, as appropriate.

Check Cashers
